

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE WAR-TRAIL:

A ROMANCE.

BY CAPTAIN MAYNE REID.*

CHAPTER I.

SOUVENIRS.

LAND of the nopal and maguey—home of Moctezuma and Malinché!—I cannot wring thy memories from my heart! Years may roll on, hand wax weak, and heart grow old, but never till both are cold can I forget thee! I *would* not; for thee would I remember. Not for all the world would I bathe my soul in the waters of Lethe. Blessed be memory for thy sake!

Bright land of Anahuac! my spirit mounts upon the aerial wings of Fancy, and once more I stand upon thy shores! Over thy broad savannahs I spur my noble steed, whose joyous neigh tells that he too is inspired by the scene. I rest under the shade of the *corozo* palm, and quaff the wine of the *acrocornia*. I climb thy mountains of amygdaloid and porphyry—thy crags of quartz, that yield the white silver and the yellow gold. I cross thy fields of lava, rugged in outline, and yet more rugged with their coverture of strange vegetable forms—the *cycas* and cactus, *yuccas* and *zamia*s. I traverse thy table-plains through bristling rows of giant aloes, whose sparkling juice cheers me on my path. I stand upon the limits of eternal snow, crushing the Alpine lichen under my heel; while down in the deep barranca, far down below, I behold the feathery fronds of the palm, the wax-like foliage of the orange, the broad shining leaves of the *pothos*, the *arums*, and *bananas*! O that I could look with living eye on these bright pictures! But even palely outlined upon the retina of memory, they impart a soothing pleasure to my soul.

Land of Moctezuma! I have other souvenirs of thee, more deeply graven on my memory than these pictures of peace. Thou recallest scenes of war. I traversed thy fields a foeman—sword in hand—and now, after years gone by, many a scene of soldier-life springs up before me with all the vividness of reality.

The Bivouac!—I sit by the night camp-fire; around are warlike forms and bearded faces. The blazing log reflects the sheen of arms and accoutrements—saddles, rifles, pistols, canteens, strewn the ground, or hanging from the branches of adjacent trees. Picketed steeds loom large in the darkness, their forms dimly outlined against the sombre background of the forest. A solitary palm stands near, its curving fronds looking hoary under the fire-light. The same light gleams

upon the fluted columns of the great organ-cactus, upon agaves and bromelias, upon the silvery *tillandsia*, that drapes the tall trees as with a toga.

The wild tale is told—the song is sung—the jest goes round—the hoarse peal echoes through the aisles of the forest, frightening the parrot on its perch, and the wolf upon his howl. Little reck they who sing, and jest, and laugh—little reck they of the morrow.

The Skirmish!—Morning breaks. The fragrant forest is silent, and the white blue light is just tinging the tree-tops. A shot rings upon the air: it is the warning-gun of the picket-sentinel, who comes galloping in upon the guard. The enemy approaches! 'To horse!' the bugle thrills in clear loud notes. The slumberers spring to their feet—they seize their rifles, pistols, and sabres, and dash through the smouldering fires till ashes cloud the air. The steeds snort and neigh; in a trice they are saddled, bridled, and mounted; and away sweeps the troop along the forest road.

The enemy is in sight—a band of *guerillas*, in all their picturesqueness of *manga* and *serapé*—of scarlet, purple, and gold. Lances, with shining points and streaming pennons, overtop the trees.

The bugle sounds the charge; its notes are drowned by the charging cheer. We meet our swarthy foemen face to face; spear-thrusts are answered by pistol-shots; our sabres cross and clink, but our snorting steeds rear back, and will not let us kill each other. We wheel and meet again, with deadlier aim, and more determined arm; we strike without remorse—we strike for freedom!

The Battle-field!—The serried columns and the bristling guns—the roar of cannon and the hoarse roll of drums—the bugle's wildest notes, the cheer, the charge—the struggle hand to hand—the falling foeman and his dying groan—the rout, retreat, the hoarse nuzza of victory! I well remember, but I cannot paint them.

Land of Anahuac! thou recallest other scenes, far different from these—scenes of tender love or stormy passion. The strife is o'er—the war-drum has ceased to beat, and the bugle to bray; the steed stands chafing in his stall, and the conqueror dallies in the halls of the conquered. Love is now the victor, and the stern soldier, himself subdued, is transformed into a sooting lover. In gilded hall or garden bower, behold him on bended knee, whispering his soft tale in the ear of some dark-eyed *doncella*, Andalusian or Aztec!

Lovely land! I have sweet memories of thee; for who could traverse thy fields without beholding some

* Right of translation reserved.

fair flower, ever after to be borne upon his bosom. And yet, not all my souvenirs are glad. Pleasant and painful, sweet and sad, they thrill my heart with alternate throes. But the sad emotions have been tempered by time, and the glad ones, at each returning tide, seem tinged with brighter glow. In thy bowers, as elsewhere, roses must be plucked from thorns; but in memory's mellowed light I see not the thorns—I behold only the bright and beautiful roses.

CHAPTER II.

A MEXICAN FRONTIER VILLAGE.

A Mexican *pueblita* on the banks of the Rio Bravo del Norte—a mere *rancheria* or hamlet. The quaint old church of Morisco-Italian style, with its cupola of motley japan, the residence of the *cura*, and the house of the *alcalde*, are the only stone structures in the place. These constitute three sides of the plaza, a somewhat spacious square. The remaining side is taken up with shops or dwellings of the common people. They are built of large unburnt bricks (*adobes*), some of them washed with lime, others gaudily coloured like the proscenium of a theatre, but most of them uniform in their muddy and forbidding brown. All have heavy, jail-like doors, and windows without glass or sash. The *reja* of iron bars set vertically, opposes the burglar, not the weather.

From the four corners of the plaza, narrow, unpaved, dusty lanes lead off to the country, for some distance bordered on both sides by the adobe houses. Still further out, on the skirts of the village, and sparsely placed, are dwellings of frailer build, but more picturesque appearance; they are *ridge-roofed* structures, of the split trunks of that gigantic lily, the arborescent yucca. Its branches form the rafters, its tough fibrous leaves the thatch. In these *ranchitos* dwell the poor peons, the descendants of the conquered race.

The stone dwellings, and those of mud likewise, are *flat-roofed*, tiled or cemented, sometimes tastefully jappanned, with a parapet breast-high running round the edge. This flat roof is the *azotea*, characteristic of Mexican architecture.

When the sun is low and the evening cool, the *azotea* is a pleasant lounging-place, especially when the proprietor of the house has a taste for flowers; then it is converted into an aerial garden, and displays the rich flora, for which the picture-land of Mexico is justly celebrated. It is just the place to enjoy a cigar, a glass of *pinolo*, or, if you prefer it, *catalan*. The smoke is wafted away, and the open air gives a relish to the beverage. Besides, your eye is feasted; you enjoy the privacy of a drawing-room, while you command what is passing in the street. The alight parapet gives security, while hindering a too free view from below; you see, without being seen. The world moves on, busied with earthly affairs, and does not think of looking up.

I stand upon such an *azotea*: it is that over the house of the *alcalde*; and his being the tallest roof in the village, I command a view of all the others. I can see beyond them all, and note the prominent features of the surrounding country. My eye wanders with delight over the deep rich verdure of its tropic vegetation; I can even distinguish its more characteristic forms—the cactus, the yucca, and the agave. I observe that the village is girdled by a belt of open ground—cultivated fields—where the maize waves

its silken tassels in the breeze, contrasting with the darker leaves of the capsicums and bean-plants (*frijoles*). This open ground is of limited extent. The *chapparal*, with its thorny thicket of acacias, mimosaes, ingas, and robinias—a perfect maze of leguminous trees—hems it in; and so near is the verge of this jungle, that I can distinguish its undergrowth of stemless *sabal* palms and bromelias—the sun-scorched and scarlet leaves of the *pita* plant shining in the distance like lists of fire.

This propinquity of the forest to the little *pueblita* bespeaks the indolence of the inhabitants; perhaps not. It must be remembered that these people are not agriculturists, but *vaqueros* (herdsmen); and that the glades and openings of that thick *chapparal* are speckled with herds of fierce Spanish cattle, and droves of small sharp-eared Andalusian horses, of the race of the Barb. The fact of so little cultivation does not abnegate the existence of industry on the part of the villagers. Grazing is their occupation, not farming; only a little of the latter to give them maize for their *tortillas*, chile to season it with, and black beans to complete the repast. These three, with the half-wild beef of their wide pastures, constitute the staple of food throughout all Mexico. For drink, the denizen of the high table-land finds his favourite beverage—the rival of champagne—in the core of the gigantic aloe; while he of the tropic coast-land refreshes himself from the stem of another native endogen, the *acromomia* palm.

Favoured land! Ceres loves thee, and Bacchus too. To thy fields both the god and the goddess have been freely bounteous. Food and drink may be had from them on easy terms. Alas! as in all other lands—one only excepted—Nature's divine views have been thwarted, her aim set aside, by the malignity of man. As over the broad world, the blight of the despot is upon thy beauty.

Why are these people crowded together—hived, as it were, in towns and villages? Herdsmen, one would expect to find scattered by reason of their occupation. Besides, a sky continually bright, a genial clime, a picturesqueness of scene—all seem to invite to rural life; and yet I have ridden for hours, a succession of lovely landscapes rising before my eyes, all of them wild, wanting in that one feature which makes the rural picture perfect—the house, the dwelling of man! Towns there are, and at long intervals the huge *hacienda* of the landed lord, walled in like a fortress; but where are the *ranchos*, the homes of the common people? True, I have noticed the ruins of many, and that explains the puzzle. I remember, now that I am on the *frontier*; that for years past the banks of the Rio Bravo, from its source to the sea, have been hostile ground—a war-border of 1500 miles in length! Many a red conflict has occurred—is still occurring—between those Arabs of the American desert—the *Horse* Indians—and the pale-faced descendants of the Spaniard. That is why the *ranchos* exist only in ruins—that is why the *haciendas* are loopholed, and the populace pent up within walls. The condition of feudal Europe exists in free America, on the banks of the Rio Bravo del Norte!

Nearly a mile off, looking westward, I perceive the sheen of water: it is a reach of the great river that glances under the setting sun. The river curves at that point; and the summit of a gentle hill, half girdled

by the stream, is crowned by the low white walls of a hacienda. Though only one story high, this hacienda appears, from its extent, and the style of its architecture, to be a noble mansion. Like all of its class, it is flat-roofed; but the parapet is crenated, and small ornamental turrets over the angles and the great gateway relieve the monotony of its outlines. A larger tower, the belfry, appears in the background, for the Mexican hacienda is usually provided with its little *capilla*, for the convenient worship of the peon retainers. The emblems of religion, such as it is, are thick over the land. The glimmer of glass behind the iron *rejas* relieves to some extent the prison-like aspect, so characteristic of Mexican country-houses. This is further modified by the appearance over the parapet of green foliage. Forms of tropic vegetation shew above the wall; among others, the graceful curving fronds of a palm. This must be an exotic, for although the lower half of the Rio Bravo is within the zone of the palme, the species that grow so far north are fan-palms (*chamerops* and *sabal*). This one is of far different form, with plume-shaped pinnate fronds, of the character of *cocos*, *phenix*, or *exterpe*. I note the fact, not from any botanical curiosity with which it inspires me, but rather because the presence of this exotic palm has a significance. It illustrates a point in the character of him—it may be *her*—who is the presiding spirit of the place. No doubt there is a fair garden upon the *azotes*—perhaps a fair being among its flowers! Pleasant thoughts spring up—anticipations. I long to climb that sloping hill, to enter that splendid mansion, and, longing still, I gaze.

The ring of a bugle reminds me of my duties. 'Tis but a stable-call; but it has driven those sweet reflections out of my mind, and my eyes are turned away from the bright mansion, and rest upon the piazza of the pueblita. There, a far different scene greets their glance.

CHAPTER III.

THE RANGERS ON PICKET

The centre of the piazza presents a salient point in the picture. There the wall (*el poso*), with its gigantic wheel, its huge leathern belt and buckets, its trough of cemented stone-work, offers an oriental aspect. Verily, it is the Persian wheel! 'Tis odd to a northern eye, particularly to find such a structure in this western land; but the explanation is easy. That idea has travelled from Egypt along the southern shores of the Mediterranean. With the Moors it crossed the Straits of Gibraltar, and the Spaniard has carried it over the Atlantic. The reader of the sacred volume will find many a familiar passage illustrated in the customs of Mexico. The genius of the Arab has shaped many a thought for the brain of the Aztec!

My eye rests not long upon the Persian wheel, but turns to gaze on the scene of active life that is passing around it. Forms, and varied ones, I trow, are moving there.

Gliding with silent step and dubious look—his wide *calzoneros* flapping around his ankles, his arms and shoulders shrouded in the mottled *serapé*, his black broad-brimmed hat darkening still more his swarth face—goes the *poblano*, the denizen of the adobe hut. He shuns the centre of the piazza, keeping around the walls; but at intervals his eyes are turned towards the well with a look of mingled fierceness and fear. He reaches a doorway—it is silently opened by a hand within—he enters quickly, and seems glad to get out of sight. A little after, I can catch a glimpse of his sombre face dimly outlined behind the bars of the *reja*. At distant corners, I descry small groups of his class—all similarly costumed in *calzoneros*, striped blankets, and glaze hats; all, like him, wearing uneasy looks. They gesticulate little, contrary to their usual

habit, and converse only in whispers or low mutterings. Unusual circumstances surround them.

Most of the women are within doors; a few of the poorer class—of pure Indian race—are seated in the piazza. They are bucksters, and their wares are spread before them on a thin palm-leaf mat (*petaté*), while another similar one, supported umbrella-like on a stem, screens them and their merchandise from the sun. Their dyed woollen garments, their bare heads, their coarse black hair, adorned with twists of scarlet worsted, give them somewhat of a gipsy look. They appear as free of care as the zingali themselves: they laugh, and chatter, and shew their white teeth all day long, asking each new-comer to purchase their fruits and vegetables, their *piñole*, *atole*, and *agua dulce*. Their not unmusical voices ring pleasantly upon the ear.

Now and then a young girl, with red *olla* poised upon her crown, trips lightly across the piazza in the direction of the well. Perhaps she is a *poblana*, one of the belles of the village, in short-skirted, bright-coloured petticoat, embroidered but sleeveless chemise, with small satin slippers upon her feet; head, shoulders, and bosom shrouded in the blue-gray *rebozo*; arms and ankles bare. Several of these are seen passing to and fro. They appear less uneasy than the men; they even smile at intervals, and reply to the rude badinage uttered in an unknown tongue by the odd-looking strangers around the well. The Mexican women are courageous as they are amiable. As a race, their beauty is undeniable.

But who are these strangers? They do not belong to the place, that is evident; and equally clear it is that they are objects of terror to those who do. At present, they are masters here. Their numbers, their proud confident swagger, and the bold loud tone of their conversation, attest that they are masters of the ground. Who are they? Odd-looking, I have styled them; and the phrase is to be taken in its full significance. A more odd-looking set of fellows never mustered in a Mexican piazza, nor elsewhere.

There are fourscore of them; and but that each carries a yäger rifle in his hand, a knife in his belt, and a Colt's pistol on his thigh, you could not discover the slightest point of resemblance between any two of them. Their arms are the only things about them denoting *uniformity*, and some sort of organisation; for the rest, they are as unlike one another as the various shapes and hues of coarse broadcloth, woollen jeans, cottonades, coloured blankets, and buckskin, can make them. They wear caps of 'coon-skin, and cat's-skin, and squirrel; hats of beaver, and felt, and glaze, of wool and palmetto, of every imaginable shape and slouch. Even of the modern monster—the silken 'tile'—samples might be seen, *badly crushed*. There are coats of broadcloth, few in number, and well worn; but many are the garments of 'Kentucky jeans,' of bluish-gray, of copper-coloured nigger-cloth, and sky-coloured cottonade. Some wear coats made of green blankets, others of blue ones, and some of a scarlet red. There are hunting-shirts of dressed deerskin, with plaited skirt, and cape, fringed and jauntily adorned with beads and embroidery—the favourite style of the backwoods' hunter; but others there are of true Indian cut—open only at the throat, and hanging loose, or fastened around the waist with a belt—the same that secures the knife and pistol. There are cloth jackets too, such as are worn by sailors, and others, of sky-blue cottonade—the costume of the Creole of Louisiana; some of red-brown leather—the *jaqueta* of the Spano-American; and still another fashion, the close-fitting embroidered 'spencer' of the Mexican *ranchero*. Some shoulders are covered by *serapés*, and some by the more graceful and toga-like *manga*. Look lower down: examine the limbs of the men of this motley band: the covering of these is not less varied than their upper garments. You see

wrappers of coarse cloth, of flannel, and of baize; they are blue, and scarlet, and green. You see leggings of raw hide and of buckskin; boots of horse-leather reaching to the thighs; 'nigger boots' of still coarser fabric, with the pantaloons tucked under; *brogans* of unstained calf-skin, and moccasins of varied cut, betokening the fashion of more than one Indian tribe. You may see limbs incased in calzoneros, and others in the heavy stamped leather *botas* of the Mexican horseman, resembling the greaves of warriors of the olden time.

The heels of all are armed, though their armature is as varied as the costumes. There are spurs of silver and steel, some plated, and some with the plating worn off; some strapped, and others screwed into the heel of the boot; some light, with small rowels and tiny teeth, while others are seen (the heavy spur of Mexico) of several pounds' weight, with rowels five inches in diameter, and teeth that might be dashed through the ribs of a horse!—cruel weapons of the Mexican *cavallero*.

But these spurs in the piazza, these *botas* and calzoneros, these mangas and serapés, are not worn by *Mexicans*. Their present wearers are men of a different race. Most of those tall, stalwart bodies are the product of the maize-plant of Kentucky and Tennessee, or the buckwheat and 'hog-meat' of the fertile flats of Ohio, Indiana, and the Illinois. They are the squatters and hunters of the backwoods, the farmers of the great western slopes of the Alleghanies, the boatmen of the Mississippi, the pioneers of Arkansas and Missouri, the trappers of prairie-land, the *voyageurs* of the lake-country, the young planters of the lower states, the French Creoles of Louisiana, the adventurous settlers of Texas, with here and there a gay city spark from the larger towns of the 'great west.' Yes, and from other sources are individuals of that mixed band. I recognise the Teutonic type—the fair hair and whitish-yellow moustache of the German, the florid Englishman, the staid Scot, and his contrast the noisy Hibernian; both equally brave. I behold the adroit and nimble Frenchman, full of laugh and chatter, the stanch soldierly Swiss, and the moustached exile of Poland, dark, sombre, and silent. What a study for an ethnologist is that band of odd-looking men! Who are they?

You have thrice asked the question. I answer it: They are a corps of '*Rangers*'—a guerilla of the American army.

And who am I? Their captain—their chief.

Yes, I am the leader of that queer crew; and, despite their rough motley aspect, I dare affirm, that not in Europe, not in America elsewhere, not upon the great globe's surface, can be found a band, of like numbers, to equal them in strength, daring, and warlike intelligence. Many of them have spent half a life in the sharpening practice of border warfare—Indian or Mexican—and from these the others have learnt. Some have been gentlemen upon whom fortune has frowned; a few have been desperadoes within the pale of civilised life; and a smaller few, perhaps, *outlaws* beyond it—bad materials wherewith to colonise; not so bad, if you go but to conquer.

Rude as is the *coup d'œil* of the corps, I am proud to say that a high sentiment of honour pervades it, higher than will be found in the picked *corps de garde* of an emperor. True, they appear rough and reckless—terrible, I might say; for most of them—with their long beards and hair, dust-begrimed faces, slouched hats, and odd habiliments, belted as they are with knife, pistol, powder-horn, and pouch—present such an aspect, that you would wrong them to take them as they look. Few among them are the pure bandits whose aim is plunder. Many a noble heart beats beneath a rude exterior—many a one truly humane. There are hearts in that band that throb under the influence of

patriotism; some are guided by a still nobler impulse, a desire to extend the area of freedom; others, it is true, yearn but for revenge. These last are chiefly Texans, who mourn a friend or brother slain by Mexican treachery. They have not forgotten the cowardly assassination of Goliad; they remember the red butchery of the Alamo.

Perhaps I alone, of all the band, have no motive for being here; if one, 'tis slight—scarce so noble as vengeance. Mere chance, the love of excitement and adventure, perhaps some weak fondness for power and fame, are all the excuses I can urge for taking a hand in this affair. A poor adventurer, without friends, without home, without country—for my native land is no more a nation—my heart is not cheered by a single throb of patriotism. I have no private wrong to redress, no public cause, no country for which to combat.

During intervals of inaction, these thoughts recur to me, and give me pain.

The men have picketed their horses in the church enclosure; some are tied to trees, and others to the reja-bars of the windows: like their riders, a motley group, various in size, colour, and race. The strong high-mettled steed of Kentucky and Tennessee, the light 'pacer' of Louisiana, the cob, the barb, his descendant the 'mustang,' that but a few weeks ago was running wild upon the prairies, may all be seen in the troop. Mules, also, of two distinct races—the large gaunt mule of North America, and the smaller and more sprightly variety, native of the soil.

My own black steed, with his pretty fern-coloured muzzle, stands near the fountain in the centre of the piazza. My eye wanders with a sort of habitual delight over the oval outlines of his body. How proudly he curves his swan-like neck, and with mock anger paws up the dust! He knows that my eyes are upon him.

We have been scarcely an hour in the rancheria; we are perfect strangers to it: we are the first American troop its people have yet seen, although the war has been going on for some months further down the river. We have been sent here upon picket-duty, with orders to scour the surrounding country as far as it is safe. The object in sending us hither is not so much to guard against a surprise from our Mexican foe, who is not upon this side, but to guard *them*, the Mexicans, from another enemy—an enemy of *both of us*—the Comanche! These Indian Ishmaelites, report says, are upon the 'war-trail,' and have quite an army in the field. It is said they are foraging further up the river, where they have it all to themselves, and have just pillaged a settlement in that direction—*butchered the men, as is their wont, and carried off the women, children, and chattels*. We came hither to conquer the Mexicans, but we must *protect while conquering them!* *Cosas de Mexico!*

CHAPTER IV.

MAKING A CAPTIVE.

I was musing upon the singular character of this triangular war, when my reverie was disturbed by the hoof-strokes of a horse. The sounds came from a distance, outside the village; the strokes were those of a horse at full gallop.

I stepped hastily across the azotea, and looked over the parapet, in hopes of obtaining a view of this rapid rider. I was not disappointed—the road and the rider came full under my eyes.

In the latter, I beheld a picturesque object. He appeared to be a very young man—a mere youth, without beard or moustache, but of singularly handsome features. The complexion was dark, almost brown; but even at the distance of two hundred yards, I could perceive the flash of a noble eye, and note a damask

redness upon his cheeks. His shoulders were covered with a scarlet manga, that draped backward over the hips of his horse; and upon his head he wore a light sombrero, laced, banded, and tasselled with bullion of gold. The horse was a small but finely proportioned mustang, spotted like a jaguar upon a ground colour of cream—a true Andalusian.

The horseman was advancing at a gallop, without fear of the ground before him: by chance, his eyes were raised to the level of the azotea, on which I stood; my uniform, and the sparkle of my accoutrements, caught his glance; and quick as thought, as if by an involuntary movement, he reined up his mustang, until its ample tail lay clustered upon the dust of the road. It was then that I noted the singular appearance of both horse and rider.

Just at that moment, the ranger, who held picket on that side of the village, sprang forth from his hiding-place, and challenged the horseman to halt. The challenge was unheeded. Another jerk of the rein spun the mustang round, as upon a pivot, and the next instant, impelled by the spur, the animal resumed his gallop. He did not return by the road, but shot off in a new direction, nearly at right angles to his former course. A rifle-bullet would have followed, and most likely have stopped the career of either horse or rider, had not I, just in the nick of time, shouted to the sentry to hold his fire.

A reflection had occurred to me: the game was too noble, too beautiful, to be butchered by a bullet; it was worth a chase and a capture.

My horse was by the water-trough. I had noticed that he was not yet unsaddled, and the bridle was still on. He had been warmed by the morning's scout; and I had ordered my negro groom to walk him round for an hour or so before letting him at the water.

I did not wait to descend by the *escalera*; I sprang upon the parapet, and from that into the plazza. The groom, perceiving my intention, met me half-way with the horse. I seized the reins, and bounded into the saddle. Several of the readiest of the rangers followed my example; and as I galloped down the lane that led out of the *rancheria*, I could tell by the clattering of hoofs that half a dozen of them were at my heels. I cared not much for that, for surely I was a match for the stripling we meant to chase. I knew, moreover, that speed at the moment was of more importance than strength; and that if the spotted horse possessed as much 'bottom' as he evidently did 'heels,' his rider and I would have it to ourselves in the end. I knew that all the horses of my troop were less swift than my own; and from the half-dozen springs I had witnessed on the part of the mustang, I felt satisfied that it remained only for me to overhaul him.

My springing down from the roof and up into the saddle had occupied scarcely two minutes' time; and in two more, I had cleared the houses, and was scouring across the fields after the scarlet horseman. He was evidently making to get round the village, and continue the journey our presence had so suddenly interrupted.

The chase led through a field of *milpas* (maize). My horse sank deeply in the loose earth, while the lighter mustang bounded over it like a hare: he was distancing me. I began to fear I would lose him, when all at once I saw that his course was intercepted by a list of *maguays*, running transversely right and left. The plants were of luxuriant growth, eight or ten feet high, and placed alternately, so that their huge hooked blades interlocked with each other, forming a natural *chevaux-de-frise*.

This barrier at first glance seemed impassable for either man or horse. It brought the Mexican to a halt. He was turning to skirt it, when he perceived that I had leaned into the diagonal line, and could not

fail to head him. With a quick wrench upon the rein, he once more wheeled round, set his horse against the *maguays*, plied the spur, and dashed right into their midst. In a moment more, both horse and rider were out of sight; but as I spurred up to the spot, I could hear the thick blades crackle under the hoofs of the mustang.

There was no time for reflection. I must either follow, or abandon the pursuit. The alternative was not thought of. I was on my honour, my steed upon his mettle; and without halt we went plunging through the *maguays*.

Torn and bleeding, we came out on the opposite side; and I perceived, to my satisfaction, that I had made better time than the red rider before me: his halt had lessened the distance between us. But another field of *milpas* had to be passed, and he was again gaining upon me, as we galloped over the heavy ground. When nearly through the field, I perceived something glancing before us: it was water—a wide drain or ditch, a *zequia* for irrigating the field. Like the *maguays*, it ran transversely to our course.

'That will stop him,' thought I; 'he must take to the right or left, and then'—

My thoughts were interrupted. Instead of turning either to right or left, the Mexican headed his horse at the *zequia*, and the noble creature rushing forward, rose like a bird upon the wing, and cleared the canal!

I had no time to expend in admiring the feat; I hastened to imitate it, and galloping forward, I set myself for the leap. My brave steed needed neither whip nor spur; he had seen the other leap the *zequia*, and he knew what was expected of him. With a bound, he went over, clearing the drain by several feet; and then, as if resolved upon bringing the affair to an end, he laid his head forward, and stretched himself at race-course speed.

A broad grassy plain—a savannah—lay before us, and the hoofs of both horses, pursuer and pursued, now rang upon hard firm turf. The rest of the chase would have been a simple trial of speed, and I made sure of overhauling the mustang before he could reach the opposite side, when a new obstacle presented itself. A vast herd of cattle and horses studded the savannah throughout its whole extent; these, startled by our wild gallop, tossed their heads, and ran affrighted in every direction, but frequently as otherwise, directly in our way. More than once, I was forced to rein in, to save my neck or my horse's from being broken over a fierce bull or a long horned lumbering ox; and more than once I was compelled to swerve from my course.

What vexed me most, was that in this zigzag race, the mustang, from practice, perhaps, had the advantage; and while it continued, he increased his distance. We cleared the drove at length; but to my chagrin I perceived that we were nearly across the plain. As I glanced ahead, I saw the chapparal near, with taller trees rising over it; beyond, I saw the swell of a hill, with white walls upon its summit. It was the hacienda already mentioned: we were riding directly for it.

I was growing anxious about the result. Should the horseman reach the thicket, I would be almost certain to lose him. *I dared not let him escape.* What would my men say, if I went back without him? I had hindered the sentry from firing, and permitted to escape, perhaps a spy, perhaps some important personage. His desperate efforts to get off favoured the supposition that he was one or the other. *He must be taken!*

Under the impulse of fresh determination, I lanced the flanks of my horse more deeply than ever; he knew what was wanted, and stretched himself to his utmost. There were no more cattle, not an obstacle, and his superior speed soon lessened the distance

between himself and the mustang. Ten seconds more would do it.

The ten seconds flew by. I felt myself within shooting distance; I drew my pistol from its holster.

'*Alto o go tiro*' (Halt! or I fire), I cried aloud. There was no reply: the mustang kept on! 'Halt!' I cried again, unwilling to take the life of a fellow-creature—'halt! or you are a dead man!'

No reply again!

There were not six yards between myself and the Mexican. Riding straight behind him, I could have sent a bullet into his back. Some secret instinct restrained me; it was partly, though not altogether, a feeling of admiration: there was an indefinable idea in my mind at the moment. My finger rested on the trigger, and I could not draw it.

'He must not escape! He is nearing the trees! He must not be allowed to enter the thicket; I shall cripple the horse.'

I looked for a place to aim at; should I hit him in the hips, he might still get off. Where?

At this moment, the animal wheeled, as if guided by his own impulse—perhaps by the knees of his rider—and shot off in a new direction. The object of this manoeuvre was to put space between us. So far it was successful; but it gave me just the opportunity to aim as I wanted; and levelling my pistol, I sent a bullet into the kidneys of the mustang. A single plunge forward was his last, and both horse and rider came to the ground.

In an instant the latter had disengaged himself from his struggling steed, and stood upon his feet. Fancying he might still attempt to escape to the thicket, I spurred forward, pistol in hand, and pointed the weapon at his head.

He had no intention either of further flight or resistance; but facing the levelled tube, and looking me full in the face, he said with an air of perfect coolness:

'*No matame, caballero! Soy muger!*' (Do not kill me, sir! I am a woman!)

NEW-YEAR'S DAY—WHEN?

AMONG the knotty questions unravelled in the almanacs and calendars, we do not, in our day and in our country, include any relating to the period of each year's commencement—the 'New-year's Day,' popularly so called. Not only are we accustomed from childhood to assign a particular day in a particular month for inaugurating each year, but it would appear a manifest absurdity if such identification were departed from; the beginning of the year, in popular estimation, is as indissolubly associated with the 1st of January as Christmas-day with the 25th of December, or Lady-day with the 25th of March. Persons who possess a little, but only a little familiarity with astronomy, believe that there is something in the planetary movements, the mechanism of the solar system, which determines the precise day whereon the year commences; it is only after somewhat deeper inquiry that this supposition vanishes, and that the mere conventionality of the whole affair becomes apparent. *There is no necessary connection between the 1st of January and the beginning of the year.* This is a curious fact in the history of dates; but a little knowledge of the matter is useful as well as curious, since a due understanding of history and biography, in other times or other countries, often depends in part on a recognition of the calendar adopted.

That this subject is important to the steady readers of history, is made evident by several remarkable

circumstances. Irrespective of the confusion arising from the Old Style and the New Style, changes in the day of beginning the year throw a complexity over historical dates. A French chronological work of great authority, *L'Art de Vérifier les Dates*, speaking of the events of the 4th of August 1563, when Charles IX. ordered the year in France to commence on the 1st of January, remarks: 'In relation to periods anterior to this date, nothing is more necessary than to remember the variations in the commencement of the year. Without care on this point, it will not be possible to reconcile various dates, which are nevertheless just and accurate in themselves; and there will be a constant liability to meet with apparent embarrassments where no errors in reality exist.' Let the reader ask himself whether he is prepared to answer the two following questions:—Was Charles I. beheaded in 1648 or 1649? Was James II. driven from the throne in 1688 or 1689? Of course, every one will expect to find these questions solved by referring to any of the familiar histories of England; but when he is informed that both pairs of dates are adopted, and that *both are right*, the importance of the matter becomes somewhat more apparent. Dipping into a pamphlet written by Henry Wilson in 1735, we find the following:—'While we are maintaining the beginning of the year according to the rubric of the Common Prayer, we seem to forget that our year begins on the 1st of January, both in our common licensed almanacs and even in the Book of Common Prayer itself; and it may mount to a question very difficult to be answered, why the rubric of the Common Prayer enjoins the year to begin on the 25th of March, and yet the column for the lessons, &c., begins on the 1st of January.' This shews how matters stood in those times.

What little philosophy there is in the question, lies in a nut-shell. That the period occupied by the earth in making one revolution on its axis should be adopted as a measure of time, the 'day,' seems reasonable enough; that the period occupied by the moon in making a circuit round the earth, from new moon to new moon, should be adopted as another measure of time, the 'lunation' or 'month,' is equally reasonable; and there is needed no great depth of scientific knowledge to perceive and admit, that a complete revolution of the seasons, during which the sun appears to travel round a whole circle in the heavens, supplies a convenient measure for a larger portion of time, the 'year.' But in this last-named period there are two sources of uncertainty—a difficulty in determining the exact number of days and fractions of days contained in a year; and a freedom of choice as to the particular day on which the year shall be said to begin. The first of these two difficulties has been lessened by the progressive advance of astronomical science; but the second remains, as it has ever been, at the mercy of conventionalism. Shall the year begin on the day when the sun attains his highest noon-altitude, or his lowest noon-altitude; or when he is at his greatest distance from the earth, or at his least distance, or at his mean distance; or in the particular season when day and night are equal all over the globe; or on a church-festival day; or on any other day? Who has a right to decide this question, and to demand that others shall agree with him?

Looking at past records, it will be seen how discordant have been the arrangements in this behalf. The letters A.U.C. in books on Roman history—*ab urbe condita*, 'from the building of the city'—give us a clue to the calendar first employed by that remarkable

people. It was a tradition that Romulus founded Rome on April 21, and this day was reckoned as a date to start from; but several changes were afterwards made in the selection of New-year's Day by priests who knew little of astronomy. In Cæsar's time, the year began in autumn; but he ordained a monster year of 445 days, in 47 B.C., in order that New-year's Day might begin in winter—thereby shewing that it depends on the choice of man, and not on the course of the heavenly bodies, whether the year shall begin on this or that day.

It is curious that the Roman A.V.C. refers to nearly the same epoch as that selected for the commencement of the Greek *Olympiads*—nearly eight hundred years before the birth of Christ. The Olympiad was a period of four years—so confused as to the number of moons or months contained in each year, that the date of New-year's Day was continually fluctuating. After forty Olympiads had passed, an adjustment was made whereby the year began between the days of new and full moon nearest to the summer solstice. Professor de Morgan, who has investigated this subject more fully, perhaps, than any other man living, cannot give classical readers more precise information than this—that the Greek year began 'within a fortnight of the beginning of July.'

When Christianity progressed and spread through Europe, it seemed fitting that men should associate the beginning of the year with some great festival in their religion, seeing that astronomy could not determine the matter; yet such was the confusion in the ancient and mediæval calendars, that many centuries elapsed before there was any definite understanding in Europe that the year should begin on the 1st of January. There were occasional discussions, too, concerning the day on which Christ was born; and, moreover, some persons reckoned the year immediately before the birth of Christ as 1 B.C., while others gave that designation to a period one year earlier. Thus there was frequently an ambiguity both in the year of the Christian era, and in the particular day on which each year was considered to begin.

Most readers know something concerning the Old Style and New Style—how that, for a thousand years or more, the Christian ecclesiastical year had been about eleven minutes too long, and that this trifling excess had accumulated to ten days; how that Pope Gregory XIII., to cure the evil, ordered that the year 1582 should contain 355 days only, in order that the Church fasts and feasts should come round again to the proper seasons of the year. All the Roman Catholic countries at once adopted this New Style, as it was termed; the Protestants of Germany gave in their adhesion in 1699, and those of England in 1752. Certain days in October 1582 were left out by the Roman Catholics, in December 1699 by the Germans, and in September 1752 by the English. The error, amounting to ten days in the sixteenth and seventeenth centuries, accumulated to eleven in the eighteenth, and is, or would have been twelve in the present century. The Greek Church, pertinaciously opposed to the Romish on many points, has to this day refused to adopt the Gregorian correction: it still adheres to the Old Style. This circumstance has led to some confusion in the records of the late war.* To us, the battle of Inkermann was fought on the 5th of November, but a Russian would date it October 24. Although *nominally* the year, in Roman Catholic Europe, both before and after the change of style, began on the 1st of January,

* 'It is frequently necessary, in Russian documents, to give a double date. This arises from the fact, that Russia still retains the Old Style, which England abandoned in 1752, and which has been abandoned by most other nations. June 14, in Russia, corresponds with June 26 in England. In any double date, the earlier of the two dates is Russian.'—*Chambers's Pictorial History of the Russian War*, p. 20.

yet the real day, the day in relation to the earth's orbital motion, was obviously different. In England, however, the change was both nominal and real; for besides the omission of eleven days in 1752, the legal year underwent a separate modification.

During past centuries, although most European nations adopted the arrangements ordered by the papal authorities concerning the length and division of the year, yet the selection of New-year's Day remained strangely discordant. In some countries, it was Easter-day; in others, Lady-day; in others, March 1; in others, Christmas-day; while in others there were actually different dates adopted in different provinces of the same country.

Let any one, who might conceive it to be an easy thing to settle such problems as mere dates, consider for a moment the confusion in the supposed age of the world. Most English writers on religious subjects in recent times set down 4004 years between the creation of the world and the birth of Christ; but theologians have counted up no less than a hundred and forty theories or estimates, ranging from a minimum of 3616 years to a maximum of 6484. Hence arose the discrepancies between the various 'eras;' such as those of Constantinople (during its Christian period), Antioch, Alexandria, Abyssinia, &c. As the eras differed, so did the New-year's Day. The Abyssinians feel so certain, or speak so boldly, on these matters, that they actually name the very day of creation, equivalent to August 29, 5493 years before the Christian era; and the anniversary of this date they select as their New-year's Day.

Nations which have not adopted the Christian faith are of course exempt from certain obligations which would appear binding on others. The Jewish civil New-year's Day has an astronomical basis, since it occurs on or immediately after the day of new moon following the autumnal equinox.

In our own country, the question has stood thus: From the seventh to the thirteenth centuries, the year was considered to begin on Christmas-day; but from thence to the middle of the eighteenth century, it was celebrated on the 25th of March. All this was in relation to the *ecclesiastical* and *legal* year, but not to the year of the historians and the common people, which from very early times began on the 1st of January. The Church wavered and hesitated between four of her festivals—the birth of Christ (December 25), the Circumcision (January 1), the Conception (March 25), and the resurrection or Easter (variable), as the beginning of the year, until a final settlement in 1752. Scotland settled the question in 1599, in a document which is worth reprinting if only as a specimen of old Scottish orthography:

'Apud Hallruidhous, xlvj Decembris—mvlxxxxix.

'The first day of the year appointit to be the first day of Januar yeirle.

'The Kingis Majestie, and Lordis of His Secreit Counsell, understanding that in all utheris weill governit commoun welthis and cuntreys, the first day of the year begynis yeirle upoun the first day of Januar commounlie callit New Yeris day, and that this realme onlie is different fra all utheris in the compt and reckining of the yeiris: And His Majestie and Counsell willing that thair salbe na disconformitie betwix His Majestie, his realme and leigis, and utheris neighbour cuntreys in this particular, bot that thay sal conforme thameselfis to the ordour and custum observit be al utheris cuntreys, especialie seing the course and seasoun of the yeir is maist proprie and anserabill thairto, and that the alteration thairof importis na hurte nor prejudice to ony partie: Thairfor His Majestie, with advice of the Lordis of his Secreit Counsell, statutis and ordanis, That in all tyme cumyng, the first day of the yeir sal begin yeirle

upoun the first day of Januar, and thir presentis to tak execution upoun the first of Januar nextcom, quhillk salbe the first day of the IM and six hundredth yeir of God: And thairfoir ordanis and commandis the clerkis of his Hienis Sessioun and Signet,' &c. &c. It ends by ordaining 'publication to be made heirof at the Mercat Croceis of the heid burrowis of the realme, quhairthrow nane pretend ignorance of the same.'

The reader will now see in what way complexity might arise concerning the two events in English history before adverted to. If Charles I. had been beheaded two months later, ecclesiastics and historians would have agreed in assigning the event to the year 1649; but as the day in question (January 30) occurred *before* the ecclesiastical New-year's Day (March 25) it was reckoned in legal and church phraseology as belonging to 1648, while historians and the public set it down as 1649. If James II. had landed in Ireland, on his futile expedition to recover his throne, a week or two later, all writers would have assigned the year 1689 to mark this event; but as it occurred early in March, it belonged to the ecclesiastical year 1688. And so of all dates between the 1st of January and the 25th of March; each date belonged to two different years, according as the historical or the legal and ecclesiastical computation was adopted. This explains the meaning of such entries as January 30, 1648, or 1648-9, or February 6, 1778, found in a multitude of publications issued a century and a half or two centuries ago: the upper or smaller number gives the date used in formal documents relating to legal and church matters; and the undermost or greater number expresses the date as used by historians, traders, and the public generally—by all, in short, who accepted the 1st of January as New-year's Day. Fortunately, it has been the custom among most of the English historians, and all of them in recent times, to adopt the popular New-year's Day in their computations; but readers accustomed to an older literature cannot afford to be off their guard in relation to any event occurring during the first three months of the year: the strange equation 1648=1649 stares them in the face.

It will be inferred, from the details above given, that other countries have not been free from the anomalies observable in our own. In France, from the days of Charlemagne to the eleventh century, New-year's Day was on Christmas-day; thence, until the sixteenth century, regal documents assumed the year to begin at Easter, after the benediction of the Holy Candle on Holy Saturday or Easter-eve, and consequently varied from year to year. Some of the French provinces at the same time adopted Lady-day; but at length the 1st of January was formally declared to be New-year's Day, by edict of Charles IX., in 1563. In Germany, the New Year anciently commenced on Christmas-day; it varied much during the middle ages; but the 1st of January became pretty generally adopted about the beginning of the sixteenth century. In Denmark, the New Year in early times was appointed on the 11th of August, the natal-day of a saint whose memory was much cherished; but this was afterwards changed for the 1st of January. In Italy, it is scarcely possible to unravel the confusion in different states between Christmas-day, the 1st of March, Lady-day, and Easter-day, until the final adoption of the 1st of January as the beginning of the year. In Russia, even to the present time, there has been an ecclesiastical New-year's Day, differing widely from that adopted in civil affairs. In Spain, Lady-day was adopted till the fourteenth century; then Christmas-day till the sixteenth; and then the 1st of January. In the Low Countries, Good Friday was added to the above list in early times; but the modern commencement was accepted in the sixteenth century.

Thus, then, we find that the right, true, orthodox, familiar, popular, domestic, boys' and girls' 1st of January has had a series of hard battles to fight, ere it could obtain a European recognition of its claim to the honours and dignity of New-year's Day.

GLIMPSES OF AFFAIRS IN AMERICA.

AN OLD QUESTION IN A NEW ASPECT.

'RACE! Do not speak to us of race—we care nothing for breed or colour. What we contend for is, that slavery, whether of black or white, is a normal, a proper institution in society.' So proclaim southern writers in the United States. The principle of enslaving only coloured persons, descendants of imported Africans, is now antiquated, and a scheme which embraces slavery of every race and variety of complexion is at length put forward as a natural and desirable arrangement for all parties—a highly commendable state of things. Any one could have foreseen that it must come to this. The prodigious and irregular amalgamation of races in the south, with the deterioration and helplessness of the less affluent class of whites in the slaveholding states, has, as may be supposed, led to a pretty nearly pure, nay, absolutely pure breed of white slaves. A new style of reasoning is consequently required. If slavery is to be at all vindicated, it must not now be on the narrow basis of colour, but on the broad grounds, that there is an inherent right in the stronger and more wealthy classes to reduce the poorer, and, it may be, more ignorant orders to a state of perpetual bondage. The cool announcement of this extraordinary doctrine, from influential parties in a great thriving republic, strikes one with so much wonder, that we almost inquire if we have heard aright, or if we are really living in the second half of the nineteenth century.

The most casual glance at the products of the southern press leaves no room for doubt on the subject. A few scraps cannot but be classed among the curiosities of modern literature. Mr Fitzhugh, a southern writer, says: 'We do not adopt the theory that Ham was the ancestor of the negro race. The Jewish slaves were not negroes, and to confine the justification of slavery to that of race, would be to weaken the scriptural authority, and to lose the whole weight of profane authority; for we read of no negro slavery in ancient times. Slavery, black or white, is right and necessary.' The *Richmond Inquirer*, an able Virginian paper, says: 'Until recently, the defence of slavery has laboured under great difficulties, because its apologists—for they were mere apologists—took half-way grounds. They confined the defence of slavery to mere negro slavery; thereby giving up the slavery principle, admitting other forms of slavery to be wrong. The line of defence is now changed. The south now maintains that slavery is right, natural, and necessary. While it is far more obvious that negroes should be slaves than whites—for they are only fit to labour, not to direct—yet the principle of slavery is itself right, and does not depend on difference of complexion.'

Mr G. W. Weston, a writer in the cause of emancipation in the *New York Tribune*, observes: 'It is not true, in law or in fact, that the condition of slavery at the south is confined to the African race. The principle of American slavery which distinguishes it from

the slavery of patriarchal times, and from oriental slavery at this day, is, that where the mother is enslaved, the offspring follow the condition of the mother. The female slaves, exposed of necessity to the disorderly passions of the whites, are made the instruments through whom the Caucasian race is itself reduced to the condition of servitude. The blood of orators, statesmen, generals, and even presidents, flows in the veins of thousands who are bought and sold like mules and horses. The time is not distant when the genuine unmixed African will not be found at the south. He is already rare, although it is less than half a century since the prohibition of the foreign slave-trade.' Besides the source of whiteness above referred to, it is understood that numbers of purely Anglo-American children pass into slavery. In some instances, the indigent whites of the south sell their children to traders; and the practice of kidnapping white children in the northern states, and transferring them southward, is said to be notoriously on the increase. We see it mentioned that, in the city of New York alone, as many as thirty children on an average are stolen yearly; it being shrewdly guessed that many of them are carried to the markets of the south, where a good price for them can be readily obtained. If there be the slightest truth in the supposition that gently nurtured white infants are so abstracted from the homes of their parents, nothing could give a more forcible impression of the horrors entailed on American society by the tolerance of slavery within its bosom.

It has been customary to blame England for having, in the first instance, introduced negro slavery into the States; but, admitting to its full extent her guilt in the slave-trade, we can hardly see how her doings in this respect are to be consistently condemned, if American writers be sincere in thinking that slavery is a normal and absolutely necessary institution. From the sentiments lately avowed, it would appear that there can be no right condition of affairs without slaves. Free labour is spoken of as improper, and a thing that must end in national disaster. The only security is for every man who has the means to buy slaves, and get all his work done by them. A widely circulated newspaper—the *New Orleans Delta*—says: 'We have a proposition to lay down that may appear startling to many because it is new, but will have weight and consideration with the thinking, inasmuch as it is based on both philosophy and experience. We therefore declare that slavery is not only national in its origin, but it is essential to republican nationality. But for slavery, republicanism would have long since become a tale in these United States. It is among the slaveholding population that republicanism has had its true home and only defence. It is they who have made the Union what it is commercially and politically. It is only they who can hereafter maintain a safe and honourable union, and enjoy rational liberty. History is instructive; heed its teachings; they are invariable and unerring. It tells us that a great republic never existed without slavery. It tells us that where partial and defined slavery did not exist of law, the mass of the working-people have been slaves, and worse than slaves. It tells us that wherever universal freedom has nominally existed, poverty, want, and possible famine, and humiliating dependency of the poor on the rich, have been the price of painted delusion. Slavery was an institution

in all the ancient republics, but in two we have eminent examples. In Rome, the mightiest in arms, and Athens, the most glorious in art of all the old republics, slavery prevailed to a greater extent than in any state of the Union. In Athens, the proportion of slaves to freemen was about two to one—in Rome, scarcely less; and yet with this institution imbedded in their very hearts, they lived and flourished, century after century, and reached a magnificence and grandeur of which the history of modern free society affords no example. Modern free society, as at present organised, is radically wrong and rotten. It is self-destroying, and can never exist happily and normally until it is qualified by the introduction of some principle equivalent in effect to the institution of negro slavery. In the northern states, free society has proved a failure. It is rotten to the core. Let the dominion which its putrescence has engendered succeed, and society, with its most sacred sanctions and its holiest institutions, will fall before it, both in the north and south, and the country must become the seat of howling anarchy or iron despotism. Negro slavery, then, is the conservative element of republicanism, and the firmest basis of society in these United States. Such being the social and political value of slavery, its diffusion and extension are of the first importance, and nothing at the present time should more nearly interest the wise philanthropist and the patriotic statesman, than to devise measures to effect these objects—to restore slavery to its original national character, and make it an object of political solicitude.'

These notions are far from singular. By several writers, freedom is spoken of with coarse contempt. 'Free society!' says the *Muscogee Herald*, an Alabama newspaper, in the interest of the new president. 'We sicken at the name. What is it but a conglomeration of greasy mechanics, filthy operatives, small-flsted farmers, and moon-struck theorists? All the northern, and especially the New England States, are devoid of society fitted for well-bred gentlemen. The prevailing class one meets with is that of mechanics struggling to be genteel, and small farmers who do their own drudgery, and yet who are hardly fit for association with a southern gentleman's body-servant. This is your free society, which the northern hordes are endeavouring to extend into Kansas.' It would be unjust to lay too much stress on the grotesque ravings of an obscure print, did they not find an echo in the *Richmond Inquirer*, a paper which, as already hinted, is conducted with no mean ability. 'Repeatedly,' says its editor, 'have we asked the north—Has not the experiment of universal liberty failed? Are not the evils of free society insufferable? and do not most thinking men among you propose to subvert and reconstruct it? Still no answer. This gloomy silence is another conclusive proof, added to many other conclusive evidences we have furnished, that free society in the long run is an impracticable form of society; it is everywhere starving, demoralised, and insurrectionary. We repeat, then, that policy and humanity alike forbid the extension of the evils of free society to new people and coming generations. Two opposite and conflicting forms of society cannot, among civilised men, co-exist and endure. The one must give way, and cease to exist; the other become universal. If free society be unnatural, immoral, unchristian, it must fall, and give way to slave society—a social system, old as the world, universal as man.' It would seem that the measure of public liberty which Washington fought for and achieved is a blunder; and that for the much-venerated free institutions of the States, must be substituted the mixture of aristocracy and helotism of the ancient world.

Another well-known Virginian print, the *Richmond Examiner*, about two years ago came out with a flat contradiction of there being any longer a desire to see the country clear of slavery. 'It is all a hallucination to suppose that we are ever going to get rid of African slavery, or that it will ever be desirable to do so. It is a thing that we cannot do without—that is *righteous, profitable, and permanent*, and that belongs to southern society as inherently, intricately, and durably as the white race itself. Yea, the white race will itself emigrate from the southern states to Africa, California, or Polynesia, sooner than the African. Let us make up our minds, therefore, to put up with and make the most of the institution. Let us not bother our brains about what *Providence* intends to do with our negroes in the distant future, but glory in and profit to the utmost by what He has done for them in transplanting them here, and setting them to work on our plantations. Let the politicians and planters of the south, while encouraging the "Baptists and Methodists"—and other denominations having a less number of votes—in Christianising the negro, keep their slaves at hard work, under strict discipline, out of idleness and mischief, while they live; and when they come to die, instead of sending them off to Africa, or manumitting them to a life of "freedom," licentiousness, and nuisance, will them over to their children, or direct them to be sold where they will be made to work hard, and be of service to their masters and to the country. True philanthropy to the negro begins, like charity, at home; and if southern men would act as if the canopy of heaven were inscribed with a covenant, in letters of fire, that *the negro is here, and here for ever; is our property, and ours for ever; is never to be emancipated; is to be kept hard at work, and in rigid subjection all his days; and is never to go to Africa, to Polynesia, or to Yankee Land—far worse than either—they would accomplish more good for the race in five years than they boast the institution itself to have accomplished in two centuries, and cut up by the roots a set of evils and fallacies that threaten to drive the white race a-wandering in the western wilderness, sooner than Cuffee will go to preach the gospel in Guinea.*

We should imagine that to most of our readers these sentiments will come with startling novelty. While the philanthropists of England are pushing forward all sorts of meliorations in social economy, they do not appear to be aware that in the progress of events beyond the Atlantic, views have arisen respecting the slave question which are altogether obstructive of popular freedom, and calculated to reduce every unprotected labourer to the condition of a chattel. 'We have,' says the *South-side Democrat*, a Virginian contemporary of the *Inquirer*—'we have got to hating everything with the prefix *free*, from free negroes down and up through the whole catalogue—free farms, free labour, free society, free will, free thinking, free children, and free schools. But the worst of all these abominations is the modern system of free schools.' The only relief can arise from a return to that blessed state in which the bulk of the population shall be kept in ignorance and servitude under a strong-handed minority—there is, it is alleged, no other means to assuage the poverty incidental to universal competition. All who are unable to maintain their families in decency, had better be at once sold to those who are disposed to take charge of them. 'Sell the parents of these children into slavery. Let our legislature (continues the authority just quoted) pass a law, that whoever will take these parents, and take care of them and their offspring, in sickness and in health, clothe them, feed them, and house them, shall be legally entitled to their services; and let the same legislature decree, that whoever receives these parents and their children, and obtains their services, shall take care of them as long as they live.' We infer from all that is told of the condition of the

impoverished 'white trash' in the southern states, that the legislative measures here pointed at would present a natural and not unlikely solution of a somewhat puzzling question. Sanguine as are our expectations of social advancement, under prudent safeguards, who can tell that at least a section of a great nation may not, even in our times, return to the almost forgotten usages of medieval Europe. The world is after all, perhaps, not so vastly improved as one would be inclined to think.

Unlike the serfdom of the middle ages, when war and famine carried off no small share of the redundant population, southern slavery cannot be successfully maintained unless means be found for employing the increase on adjoining lands, or disposing of it for transit to distant settlements. The pressing necessity for extending limited properties into large possessions, is stated to be operating on a gigantic scale in Alabama. The Hon. C. C. Clay, Jun., on lately addressing a Horticultural Society in that great cotton-growing state, laments the absorption of small properties. 'Our wealthier planters,' he observes, 'with greater means, and no more skill, are buying out their poorer neighbours, extending their plantations, and adding to their slave force. Of the 20,000,000 of dollars annually realised from the sales of cotton crop of Alabama, nearly all not expended in supporting the producers is reinvested in land and negroes. Thus, the white population has decreased, and the slave increased, almost *pari passu* in several counties in our state. In 1825, Madison county cast about 8000 votes; now she cannot exceed 2800. In traversing that county, one will discover numerous farmhouses, once the abode of industrious and intelligent freemen, now occupied by slaves, or tenantless, deserted, and dilapidated; he will observe fields once fertile, now unfenced, abandoned; he will see the moss growing on the mouldering walls of once thrifty villages, and will find "one only master grasps the whole domain," that once furnished happy homes for a dozen white families.' To this dismal description, that respectable authority, Olmstead, says that the political experiment of Old Virginia, the Carolinas, and Georgia, is being repeated to the same fatal result in Young Alabama.

The generally blighting influence of slavery is clearly a main cause of its extension. To exist at all, it must push into new regions, everywhere exhausting lands, extinguishing freedom, and dishonouring independent rural industry. Pursued by a fearful Nemesis, the slave-power still seeks for more and more scope for its devastating encroachments. An amount of labour far beyond the bounds of internal supply is in demand. If the great west is to be added piecemeal to the slave states of the Union, the breeding-pens of Virginia will fail to furnish stock except at exorbitant prices. Nothing, accordingly, remains but a legalised revival of the slave-traffic from the coast of Africa, or the legal extension of slavery to the poorer classes of the white population. We have seen what is said of the latter expedient; and a desire to supply the labour-market by the former odious means is likewise expressed in no reserved terms. The *New Orleans Delta* says, on a late occasion, 'we not only desire to make territories, now free, slave territories, and to acquire new territory into which to extend slavery—such as Cuba, North-eastern Mexico, &c.—but we would reopen the African slave-trade, that every white man might have a chance to make himself owner of one or more negroes, and go with them and their household gods wherever opportunity beckoned to enterprise. But the north would never consent to this; they would dissolve the Union rather than grant it, say the croaking impracticables. Gentlemen, you do not know the north, oracular as you look when dubiously shaking your heads. It would not oppose

any more bitterly a large demand like this, boldly made, than the smallest one, faintly and politely urged. Try it. There is nothing to lose by the experiment. At all events, if the attempt to reopen this trade should fail, it would give one more proof of how injurious our connection with the north has become to us, and would indicate one more signal advantage which a southern confederacy would have over the present heterogeneous association called the Union.' How the north has deserved that cut! The advantages of a revived African slave-trade were argumentatively pointed out by the *Charleston Standard* so recently as last October. 'From first to last, there has been a constant want of labour. Three millions of our people have perhaps as many slaves as they naturally require; but there are three millions more who are unsupplied. They would take slaves if they could get them; but they are not to be had at prices which will enable them to be used in competition with the free labour of the world. All we have are wanted for agriculture, and even these are not enough. While all are employed, and employed most profitably, lands all over the country are parched and unprofitable for the want of labour, and millions more could have been absorbed. The labour of those brought one year, would have paid for those to be brought the next; as employments opened, white men of enterprise would have come in more abundance than they have done; the stream of labour from Africa would have met a stream of enterprise from Europe; both would have poured in together; the population of the southern states would have been more dense; the population of the northern states would have been more sparse; Georgia would have been to New York as New York is now to Georgia; other states from Texas and New Mexico would have been brought in; and thus, if the slave states had held on to the sources of their real power, the south would have been the Union. . . . There is now buried under every acre of land in South Carolina at least fifty dollars in gold; and the day that the savage African is landed on our shores to cultivate it, that gold will glitter on its surface.'

It will not be imagined that these wild opinions meet with universal response in the south, where, indeed, many planters above the ordinary standard are conscious of the evils of slavery, and would gladly listen to any reasonable plan for relieving themselves of their coloured dependents. Least of all do such notions meet with approval in the north. But it is not less certain that, from causes not far to seek, a new tone of sentiment has begun to prevail among the general slaveholding interest. What was long lamented and reluctantly endured, is now resolutely maintained, and arguments are found to vindicate its indefinite extension. A social condition in which slavery is a necessary ingredient, is ardently defended by the most able writers of the day. Clergymen of reputation pronounce a glowing eulogium on the institution. According to a report in a New Orleans paper, one of these clerical orators, the Rev. C. R. Marshall, in a speech on education, described slavery 'as contributing to the glory in arts and sciences, in religion, and national prosperity, in all countries wherein it has ever existed . . . he believed slavery to be right, and that within fifty years, instead of decreasing, it would be double in extent to what it now is.' Secretly disliked as such opinions may possibly be, they meet with little open challenge, either north or south; and looking only to practical results, it is observed that the extreme party which denounces free labour, and ostentatiously aims at slavery extension, has, with a marvellous degree of general accord, assumed the entire control of public affairs. By a distinctly marked movement over a period of nearly sixty years—a movement seen better, perhaps, at a distance than near at hand—the grand old spirit of '76, which

rolled back the power of England, has obsequiously quailed before the menaces of a body of partisans insignificant in point of numbers, but unscrupulous in the means by which they uphold their remarkable supremacy.
W. C.

CHRISTMAS AMONG THE NORSEMEN.

CHRISTMAS, regarded in its social aspect, is pre-eminently a Teutonic festival. Among the Latin and Slavonic races, it is observed as a season of religious joy and thankfulness; among the Norse and Saxon nations alone is it celebrated with social festivity. In Germany, the domestic observance of Christmas is remarkable alike for its childlike physiognomy and its pictorial effect. The Lilliputian fir-tree, with its fairy lights, its glittering gifts, its joyous circle of visitants, all have, of late years, become so familiar to us in our own land, that we stay not to depict them here. Rather would we transport our readers nine hundred years back, to gaze upon a Christmas festivity amidst our Norse forefathers, from whom have been derived many of those social customs which are now entwined within the very heart of Great Britain and its people.

It was towards the close of the tenth century: the scene is laid at Drontheim, within the king of Norway's palace. But let not our readers be misled by these courtly words of 'king' and 'palace,' for in those times the kings of Norway were rather pirate sea-kings than established rulers of the people who owned their sway; and their palaces were merely wooden houses, laid upon a loose stone foundation, and destitute alike of the elegances and luxuries of life.

Only a few years before the period above alluded to, and the winter festival at the 'king's house' in Drontheim was altogether of a heathen character, for he and his bondsmen always met together at mid-winter to celebrate a festival called Yule, in honour of Odin, and so designated from Yeolner, one of his names. It was a time of merriment and good cheer, when horses were slain in sacrifice, and their flesh eaten by the guests. It was also called Höggn Nott* (hewing-night), because of the slaughtering of cattle which then took place. At these feasts, the people drank to excess of ale and mead, emptying goblets in memory of departed friends, and offering remembrances to the gods, praying at the same time for a good season during the ensuing summer. Now, however, all this was at an end, at least within the neighbourhood of King Hakon the Good, who had been educated in England under the care of his foster-father, King Athelstan, and who, on his return to Norway, had introduced Christianity into that country. Most of the people were still heathens at heart; but in obedience to King Hakon's order, 'the Yule, or mid-winter festival, was now to be begun at the same time the Christians kept it, and every man was obliged, under a certain penalty, to brew a meal of malt into ale, and therewith kept the Yule holy as long as it lasted.' The good king hoped thus to 'entice his subjects into Christianity,' a rather questionable mode of procedure in so grave and important a matter; but however ill he may have succeeded in the great object he had in view, the result henceforth was, that Christmas became indissolubly associated in the Norse mind with merry-making and good cheer.

And now that Christianity was in some fashion established in Norway, let us glance for a moment into King Hakon's hall, while he is seated among his chief bondsmen at the Christian Yule feast. It is a spacious but low apartment, built of wood, and wainscotted with the same, having the floor strewn with

* Hogmanay-night is still the vernacular name in Scotland for the first night of Yule.

juniper-tops, which imparted a peculiar fragrance to the whole dwelling. In the centre of the chamber, upon a broad flag, was piled a fire whose smoke partially escaped through a hole in the roof. The huge Yule-log was placed upon the summit of the pile, and shed its fierce and glowing flame upon the guests, who sat upon two long benches at each side of the fire. A lofty seat was placed upon the middle of one of those benches, and there the king sat high above his subjects. The caldron of horseflesh was no longer seen upon the fire, for this viand was so closely associated with heathen rites and heathen worship, that King Hakon had absolutely prohibited its use; but the slaughtered ox had been feasted upon by the guests. And now the drinking-horn was filled with ale, which King Hakon quaffed to his father's memory; and as he rose up reverently for that purpose, his bondsmen gazed upon their king with satisfaction; for not only was he tall and comely in person, but there was also an air of sagacity and decision in his countenance which made him feared as well as loved by his subjects.

Next, there was handed to him a larger horn, filled to the brim with foaming ale. Studs were fixed within it at certain intervals, marking the portion of liquor allotted to each guest. This was called drinking by measure. They handed this horn to each other across the fire, each one drinking in succession to Christ's health—a strange idea this, in our eyes, but in those rude and primitive times this social custom was an open and practical testimony that they had abandoned dead idols for a living Saviour. After this solemn draught, the horn circulated freely among the guests, who now quaffed it without measure during many succeeding hours of the night.

After this rude fashion they feasted day after day, until New-year's-eve, when the king dismissed his guests with handsome presents, giving to the most distinguished persons among them gold-mounted swords, which had been prepared for the occasion.

These festal Christmas customs were introduced by the Northmen into Great Britain, which, during the ninth and tenth centuries, suffered severely from the continual inroads of these hardy and adventurous Norsemen, by whom eventually a large portion of Scotland and of England was populated. They brought with them their deep reverence for law, their true loyalty of heart, and—alas! that there should be a dark shade in the picture—their inordinate love of the foaming horn, now exchanged for the tankard.

Amid all the changes of the last eight or nine hundred years, the merry Christmas of the Norseman still lives on in the hearts and homes of Great Britain; but little do many of our hardy northerners, while placing the Yule-log upon their hearths, imagine that the very word itself may be traced back to the dark ages of heathenism, when their forefathers, instead of eating roast-beef at Christmas, devoured horseflesh in honour of Thor and Odin!

SEVENTEEN HUNDRED AND FIFTY-SIX.

A RETROSPECT ON NEW-YEAR'S EVE.

THE final day of the period known and to be chronicled in the world's history as *Anno Domini* 1856, is quickly waning away into the irrevocable region of the past; and the deep-toned bells are ready to announce, with pealing chime, the advent of another January, the first day of a new year—a day of solemn and serious consideration, if you will, yet one also of social greetings and innocent enjoyment. In all seemliness and propriety, we may mingle gaiety with gravity, and be merry as well as meditative, while hopefully wending our way by this prominent landmark in the pilgrimage of life; for whatever individual suffering or distress we may have encountered in the passing, or may naturally expect to meet with in the coming year, we

can console ourselves with the reflection, that the aggregate amount of human misery is gradually decreasing—that the world is annually becoming wiser, better, and happier. As the careful merchant, at the close of a year, enumerates his stock, balances his books, and congratulates himself on his gains, or sighs over his losses, so it might not be amiss if we made a few inquiries respecting our progress in civilisation and refinement, in the improvement of the individual and society at large. We can do so only by summoning up the past, and comparing it with the present; and though it be true that the coming year opens with fairer prospects than its forerunner, inasmuch as peace is preferable to war, yet a single twelvemonth, however important an item in the lifetime of a man, is but an infinitesimal portion in the age of the world. Consequently, we must, if we wish to estimate properly our advancement or retrogression, include a much greater scope of time. Let us, then, looking back one hundred years, examine the records of 1756, and we shall find that our advance has been prodigious, and learn that all silly maundering about the good old times is worse than nonsense.

Though the French and their savage Indian allies were ravaging the frontiers of our then American colonies—though the governor of Pennsylvania, a British officer and gentleman, was offering a bounty of 150 dollars for every male French or Indian scalp, and the third of that sum for every female one, that could be taken and brought to him—though English ships-of-war were capturing and destroying French merchantmen wherever they could be met with, yet the two nations were at peace—such a peace!—during nearly the first five months of 1756. As heartless Horace Walpole remarks of this period, the English and French ministers were crossing over, and figuring in—in politics. Each country, in fact, was sedulously preparing for war, while deceitfully, or diplomatically, which is much the same sort of thing, endeavouring to gain time by pretending to treat for peace.

There were few newspapers in those days; and indeed there were little if any of that literary, scientific, and social intelligence we now include under the denomination of home news. The leading announcements, referring to domestic affairs, in the journals of 1756, are little more than records of crimes and punishments, and the proceedings of press-gangs. According to our modern notions, London could not have been a very pleasant place to reside in at that time. Highwaymen laboured in their vocation at Knightsbridge; well-guarded mails were stopped, and robbed at Notting Hill. Some parts of the metropolis were continual scenes of riot and disorder. Spitalfields was a complete Alsatia. The denizens, principally weavers of that locality, whom we now associate with ideas of feeble misery and helpless poverty, were then the terror of London. In organised bodies, and armed with cutlasses and bludgeons, these Ishmaels of the gutter fought with hordes of Irish, crowds of soldiers, and crews of sailors; and even afforded a sanctuary to numbers from the formidable press-gang. They were known by the appellation of Cutters, because they levied a frequent black-mail, from the master manufacturers, of four shillings on each loom employed in the district; and if the money were not promptly paid, they cut into pieces the cloth or yarn in process of manufacture. The Cutters reigned till 1769, when their leaders were attacked in their head-quarters, a public-house named the Dolphin, by a posse of magistrates and constables, supported by a detachment of soldiers. The preliminary summons to surrender being treated with contemptuous indifference, a brisk firing commenced from both sides. The Cutters, barricading the lower part of the house, fired out of the windows, till the door was forced; they then retreated over the adjoining house-tops, firing as they went. By this

bold defence, they succeeded in escaping to a man; but one soldier was shot dead on the spot, and others were severely wounded. In consequence of this affray, the parish church was converted into a temporary barracks, and occupied by a strong body of troops, who succeeded at last in putting down the pugnacious Cutters.

The bill for building Blackfriars' Bridge was passed in 1756—of course not without great opposition from 'vested interests'—and one of the arguments adduced in favour of the project was, that between Fleet Street and the Thames on one side, and Holborn on the other, there were nothing but ruins, filth, alleys, and dung-hills—the lurking-places of the most desperate and flagitious characters. Even the best parts of London were frequented by footpads; and gentlemen, when out at night, in preference to riding in a carriage or chair, walked, with their drawn swords in their hands, so as to be better prepared to repel an attack; for then almost every male adult wore a sword—a custom which, allowing no time for passion to subside or reason to reflect, led to frequent and fatal encounters. Every tavern, gaming-house, and disreputable haunt was the scene of sanguinary contests between wine-maddened duellists. So common and so little thought of were these occurrences, that we seldom meet with notices of them in the newspapers of the time, except in connection with some other circumstance; as for instance: 'The cook at the Shakspeare, who was run through the body in endeavouring to prevent two gentlemen from fighting a duel, is in a fair way of recovery.'

A few years previous to the time of which we write, the king, in his speech to parliament, said: 'It is with the utmost regret I observe that the horrid crimes of robbery and murder are, of late, rather increased than decreased.' As a remedy for this state of affairs, a reward of £40 was given to every one who arrested a thief, and prosecuted him to conviction and the inevitable gallows. The suburban districts also formed societies, and gave £100 more, if the offence took place five miles distant from the city. Moreover, every one who captured a highwayman was entitled to the culprit's horse, whatever might be its value, or whoever might have been its legitimate owner. The highwaymen, being well mounted and well armed, were seldom captured, except in their hours of recreation. But these rewards gave rise to a regular business of 'thief-making' and 'thief-taking.' Gangs of villains, conspiring together, trepanned simple youths into seeming robberies; and succeeded in hanging numbers of lads, for the purpose of pocketing the price of their guiltless blood. As may be supposed, those ancient English institutions, the gallows, pillory, and whipping-post, flourished exceedingly one hundred years ago.

In Maitland's *History of London*, published in 1756, there is an engraving of Newgate, as it then appeared, and on the top of the building we see a large machine resembling the sails of a wind-mill. This was a ventilator, to dissipate the vitiated air of the prison, which it did, to the great annoyance of the neighbourhood. The cause of this machine being erected was, simply, that in the spring of 1750, the jail-distemper, a kind of typhus now unknown, caused by crowding and insufficient air, found its way from the jail to the sessions-house, and killed two judges, one lord-mayor, several aldermen, jurymen, and others, to the number, in all, of sixty persons. The building of this ventilator, though a step in the right direction, was, like many other of our reformatory movements, a vain attempt to remedy an effect without doing away with the cause—an ineffectual endeavour to cure an evil, without the slightest reference to its prevention; for we read in the same work that, even with the ventilator, 'the prisoners are packed so close together, and the air so corrupted by their stench, that it occasions a disease, called the jail-distemper, of which

they die by dozens; and cart-loads of them are carried out and thrown into a pit in the church-yard of Christ's Church, without ceremony. And to this wretched place many innocent people are sometimes sent, and loaded with irons before their trial, not to secure them, but to extort money from them by a merciless jailer; for if they have money to bribe him, they may have their irons as light as they please.'

The most revolting spectacle of the present day is, without doubt, an execution; yet, happily, this opprobrium of our age and common Christianity is now, comparatively speaking, a rare occurrence; and, hideously appalling though it be, is unattended by the riot, licence, and debauchery—not confined to one spot, but extending over a distance of three miles—that characterised the London executions of one hundred years ago. Hogarth, as the closing scene in the life of 'the idle apprentice,' has exhibited to us the awful procession from Newgate to Tyburn. As the engraving is known to almost every one, we need not further allude to it. But from a newspaper writer of the period, though the quotation be long, and its composition awkward, we feel bound to extract the following description of Newgate on the morning of, and the subsequent journey to Tyburn, to more forcibly illustrate an execution, the superior arrangements, the more decent conduct—in short, the advancement in civilisation of our own era.

'The horrid aspect of turnkeys and jailers, in discontent and hurry; the sharp and dreadful looks of rogues that beg in irons, but who would wish to rob you if they could; the bellowing of half-a-dozen names at a time to inquire after one another; the variety of strong voices howling in one place, scolding, quarrelling, and swearing in another, loud bursts of laughter in a third; the substantial breakfasts that are made in these scenes of horror; the seas of beer and gin that are swallowed, the incessant outcries for more, and the bawling answers made by the tapsters; the impudent and unseasonable jests; the general nastiness, with the oaths and imprecations echoed from every quarter of the prison, added to the melancholy clank of chains and fetters, compose altogether one of the most horrid spectacles the eyes of thinking men can behold. Yet how much more terrific is this dreadful scene rendered by the behaviour of the men just setting off for execution, who are madly drinking or uttering the vilest ribaldry, and jeering others that are less impatient; while the ordinary bustles among them, and shifting from one to another, distributes scraps of good counsel to inattentive hearers; and near him, the hangman, impatient to be gone, swears at their delays.

'At last they set out, and with them a torrent of mob, consisting of the idlest of holiday-makers, and all the thieves of both sexes, who meet with that security which large mobs afford, so that this occasion becomes a jubilee-day for all offenders, who dare not appear on any other, the confusion making a free mart, an amnesty for all outlaws. To add to the rudeness of the scene, two or three sweeps generally mount the horses that draw the convicts, whose sooty aspects and ludicrous gestures divert the crowd; and the cavalcade, instead of impressing those salutary impressions on the minds of spectators which it is alone intended for, becomes an impious spectacle of laughter, riot, and disorder. The way from Newgate to Tyburn is now one continued fair of the meanest of the rabble. Where the crowd is thinnest, dead cats and dogs fly about, and are deemed excellent pastime. The nearer they approach the gallows, blows are struck, heads are broken, and swinging pieces of stick are thrown about. Amidst this rioting, the sound of different noises, and a variety of outcries on every side, making up a discord not to be paralleled, the last psalm is sung; and the ordinary and executioner, having performed their duties with little ceremony and less concern, seem

tired and glad that it is over. The tragedy being ended, a fresh fray arises between the mob and the surgeons about the property of the dead bodies; and the morning's amusement ends with often the loss of more lives than die by the halter.'

In a pamphlet of a much later date, the writer, condemning this horrible system, states that although the unhappy convicts were almost invariably intoxicated when they left Newgate, they were 'suffered to stop twice or thrice, on the way to Tyburn, to receive fresh comfort from strong waters.' He further tells us that, after the execution, the hangman stripped the dead bodies, the clothes being his disgusting perquisite. Then the fight commenced among the mob, one party endeavouring to secure the bodies to sell them for dissection, the other to carry them off to their friends for interment. 'Some wretches,' he continues, 'are so miserable as to have no mob either for or against them, and their bodies (it is horrible, but true) lie, to the dishonour of the laws and the disgrace of human nature, absolutely naked under the gallows, till some charitable Christian pays, or till the inhabitants, to be rid of the stench, cause a hole to be dug for interment, without any intervention of authority in either case.'

Referring to newspapers published in the time of the grandfathers of many now living, we read that, on the first Monday in 1756, a deserter from the Foot Guards, a young man of respectable family, was brought out of the Savoy prison in the Strand. Accompanied by his brother and two clergymen, escorted by 400 soldiers, with drums beating the Dead March, and followed by an immense crowd, the unhappy deserter was led through the streets to Hyde Park, and there shot and buried. The government improved this occasion in a curious manner. The Sunday evening previous, warrants for pressing landmen were secretly issued, and thus the 400 soldiers that guarded the miserable man to execution, formed a very efficient press-gang among the crowd that came to witness it. A few days afterwards, 'a vagabond fellow' was, by order of a magistrate, flogged at the public whipping-post in Covent Garden market for a petty theft.

Early in the year, a hot press took place at Edinburgh, Leith, Newhaven, and Musselburgh: the constables of Edinburgh netted sixty captives on the first day. The next Sunday, a press-gang made its appearance on the High Street, 'just after sermons.' The friends of a journeyman baker, who was among the captured, boldly attempted a rescue. In the fray that ensued, the gang were worsted, and, to save their lives from the infuriated populace, were glad to accept the protection of the town-guard. It then turned out that the gang had no warrant for their proceedings, but were merely a number of ruffians pressing, as our American friends would term it, on their own hook. For every man they took to the rendezvous at Leith, they received a consideration, and no questions were asked. As loyal and patriotic subjects, endeavouring to augment his majesty's forces by sea and land, these ruffians considered they were entitled to all praise. But the lord provost, taking another view of the matter, had the pseudo press-gang flogged through the city, the magistrates, officers of the train-bands, constables, and firemen, honouring the ceremony by their official presence.

About the same time, Mr Blair, the minister of Ruthven in Badenoch, after preaching a sermon on 'the audacious intention of a French invasion,' offered from the pulpit a guinea to every man who would join Lord John Murray's Highland regiment. Whether there were many or few applicants for the worthy clergyman's guineas, we do not know, but we read in the papers of the day of recruits to the number of thirty at a time being sent off, handcuffed, and under a strong guard, to join the same regiment. While the recruiting system of the present time implies a

voluntary contract, it was very different one hundred years ago; for instance, we learn that when the constables and servants of Sir Lewis Mackenzie were employed recruiting on his estate in Ross-shire, one stubborn Celt, named Kenneth Huppy, fled to the hills; and even after a long chase, when overtaken by Sir Lewis's gardener, Huppy, still declining to be recruited, stabbed his pursuer to the heart.

As a somewhat parallel circumstance to the announcement in the kirk of Ruthven, we may mention that, in the same year, a notice was read during divine service in the parish church of St George's, Middlesex, to inform the congregation that the church-wardens intended to fit out a privateer, and subscriptions for the patriotic purpose would be received in the vestry. We need scarcely observe, that the war just concluded was the first ever carried on by this country without having recourse to impressment and privateering. Whether the former was judiciously abstained from because the people really would not have submitted to it—the latter, because the enemy had but few merchant-ships to capture, it were needless to inquire. At anyrate, British subjects were not, as before, inhumanly dragged away into the worst kind of slavery; nor our merchants degraded by being connected with a legalised piracy. The London newspapers of the period seem to delight in relating the doughty doings of the press-gang. We read that on one occasion the gang received information that a sailor, their legitimate prey, was protected in a house in Spitalfields. Here was an opportunity of distinction, and of lowering the pride and prestige of the Spitalfields men, who had vowed that no man should ever be pressed in their locality. The house being known, a powerful gang, making a sudden foray, dashed into the dangerous district, captured their man, and carried him away, ere the surprised Spitalfieldians could muster in sufficient force to cut off the hasty retreat. As it was, the capture was not made without bloodshed; the gang left behind them two Spitalfieldians lying dead on the street.

Sedan-chairs were then in vogue, and the principal chair-stand was in St James's Street. The brawny chairmen at this stand were long objects of desire to the gang, and at last a grand razzia was made upon them. The chairmen fought like heroes, repulsed the gang, and drove them down the street to the very gate of St James's Palace. There the tide of war ebbed: the palace-guard was called out, and thus reinforced, the gang returned to the fray. Lives were taken, and fearful wounds inflicted on both sides; yet, after all, only three badly wounded chairmen were captured, and carried off to serve his most gracious majesty.

Besides its legitimate duty of providing seamen and soldiers for the service of the state, the press-gang was by no means unfrequently employed to suit private purposes. By its friendly aid, a rival in love or business, an adverse witness, or importunate creditor, any individual, in fact, whose presence was obnoxious or undesirable, could readily be put out of the way, if not for ever, as was most probable, at all events for a considerable period. Even wives managed to get rid of their husbands by this summary process of divorce; and, in the very year we refer to, a daughter procured the impressment of her father, to the end that she might uncontrolledly dissipate his hard-earned savings in vicious indulgences. To be sure, where men were concerned, the chances were equal: Nokes could bribe the gang to waylay and press Stiles, just as Stiles might perform the same good turn for Nokes; but as women were not liable to impressment, it may be imagined that the advantage lay on their side. No such thing, however; though women could not be pressed, still they could be got rid of in another manner—consigned to a more dreadful fate. The private madhouses of the period were a thousand times worse than the holds of the press-tenders, worse even than

the floating Pandemoniums ships-of-war then were. The evidence given before the parliamentary committee that inquired into the state of private madhouses in 1762, is a heart-sickening disclosure of human wickedness and helpless misery; and the committee, in their report, state that 'the avarice of the keepers, who were under no other control than their own consciences, led them to assist in the most nefarious plans for confining sane persons, whose relations or guardians, impelled by the same motive or private vengeance, sometimes forgot all the restraints of nature, and immured them in the horrors of a prison, under a charge of insanity.'

Four of the 'thief-makers' already alluded to were tried and convicted, at the Old Bailey sessions, in March 1756, for conspiring to prosecute an innocent lad to death, on a false charge of robbery, so that they might obtain the reward, or blood-money, as it was then termed, amounting to L.140. Part of their sentence was to stand in the pillory, and, accordingly, two of them were pilloried in Holborn. A newspaper informs us that 'such a multitude of people were never known to be collected on a like occasion. A woman was terribly gored by a bullock, and almost trod to death by the mob; a painter's man was pushed out of a cart, had his skull fractured, and was taken up insensible; several people were run over and hurt, and much mischief done. Two pickpockets, being detected at the end of Fetter Lane, were so severely disciplined by the populace, that they were scarcely able to crawl away.' The two wretches in the pillory were pelted with stones, brickbats, and oyster-shells; and when released at the expiration of an hour—the period of their sentence—they were found to be speechless and insensible, but subsequently recovered. Three days after, the other two were pilloried in Smithfield. So briskly were they pelted, that when half an hour had elapsed, the mob, perceiving that one of the two was dead, forbore to throw any more at them. Neither was released, however, until the hour had expired, when the survivor was found to be fearfully mangled, but still breathing.

Such continual scenes of violence were not without their natural fruits—all grades in society were demoralised, and an utter recklessness prevailed with regard to human life. Three captains in the army, who were recruiting at Gravesend, wished to visit the theatre at Greenwich; for this purpose, they hired two post-chaises, and set off on their journey. The officers, afraid of being too late for the performance, kept urging the postboys to drive faster than the horses really could go. On this account, an altercation ensued, and one of the captains, drawing his sword, ran a postboy through the body, and even cut and hacked at the dying man as he lay helplessly bleeding on the ground. The other postboy would have shared the same fate, had not a labourer, who happened to be repairing a hedge by the roadside, rushed forward, and with his hedge-bill held the captains at bay. At this juncture, a sturdy butcher came up, and the officers were disarmed, and made prisoners. A coroner's inquest brought in a verdict of wilful murder against the three. They were committed to Maidstone jail, and in due time tried; two were acquitted; the third, who had stabbed the postboy, was condemned and executed.

Another instance of reckless disregard of human life, to say nothing of the destruction of valuable property, occurred about the same time. The good ship *Virginia Merchant* arrived at Bristol with a valuable cargo, consisting of 400 hogsheads of tobacco, and other colonial produce. The tender sent a boat to press, but the homeward-bound crew resisting, compelled the gang to sheer off. The tender then opened fire with her great guns on the unfortunate *Virginia Merchant*, and in a short time, not only killed several of her crew,

but sank her, tobacco and all, to the bottom of the Severn. Probably it is of the same tender we read the following sadly suggestive paragraph: 'The mother of one of the two young gentlewomen who were forcibly taken on board the tender at Bristol, and kept there two days, has since went deranged.'

At a period when man had so little mercy for his fellow, we cannot suppose he had any for the brute creation; and we accordingly find bear and bull baiting, with cock-fighting, to have been the favourite amusements of all classes. Yet there were still more gross and inexcusable cruelties committed on the lower animals, without the excitement of contest or gambling, merely to afford a fiendish pleasure to the perpetrators. Who can look upon Hogarth's *Six Stages of Cruelty*, without shuddering? yet such were then the common spectacles of the public streets. Hogarth, as amiable in feeling as admirable in art, says that 'these prints were engraved with the hope of in some degree correcting that barbarous treatment of animals, the very sight of which renders the streets of our metropolis so distressing to every feeling mind.' And he subsequently added: 'If they have had this effect, and checked the progress of cruelty, I am more proud of having been the author, than I should be of having painted Raphael's cartoons.'

The class we now term the people was not in existence in those days, but there was, as Sir John Fielding tells us, 'the rabble, very insolent and abusive, and that sometimes without the least appearance of a cause.' The astute magistrate adds, for the benefit of strangers: 'When this happens, it is always prudent to retire, and give them their way.'

It would be a waste of time to pursue the subject further. Our improvement has been great—much greater, probably, than the imagination can readily realise. There has been no retrogression; the march has ever been onward. Looking out, as we write, into the clear wintry twilight, over a wide reach of the Thames, as it sweeps past the lofty elms and old ivy-covered houses of a river-side Mall, we can see the tide swiftly ebbing downwards in the centre of the stream; while a counter-eddy, on each side of the river, slowly flows in a contrary direction, till it is absorbed and carried away by the main central current. So it is in the great stream of human progress—the very speed and impetus of its central current causes lateral eddies, seemingly flowing backwards, but in reality forming an integral part of one great onward movement.

Closing, then, the dreary records of the past, let us cheerfully and confidently look forward to the future; and, remembering the poet's injunction with regard to the treatment of a guest, let us also

Welcome the coming, speed the parting year.

A CUNNING HAND AMONG THE BRANCHES.

DID you ever notice that sometimes two branches of a tree produce a perfect bifurcation; that is, that they separate from a common point? If you examine closely, you will find that such branches took their departure from one and the same bud. In rarer instances, you may see five or six branches all starting from a common centre, and with a regularity that surprises when contrasted with the arrangement of the rest of the tree.

These effects are now and then produced by gemming or inoculating, and not seldom by the unassisted handiwork of nature. When the latter is the case, the bifurcation is caused by the bite of a caterpillar or some other voracious insect. An insect has but to gnaw the point of a bud to make it grow double, triple, quadruple, and so forth, to transform itself indeed into

numerous buds, thereafter distinct and separate, each passing singly through all the phases of its vegetation.

What is here said applies to buds that produce wood; it is equally true of those that produce fruit. The insect plies its mandibles, and quite unconsciously starts a new order of developments. After all, however, a little reflection would lead us to believe that buds might be as fecund as seeds. If one grain of wheat produces many grains, why not one bud many buds, if we can only get it into the right condition? What this condition is, we learn from the insect.

At all events, it has been learned by M. Millot-Brulé of Réthel (Ardennes), and turned to good account, for he produces effects at pleasure without waiting for the accident of an insect: with the point of a penknife, or a slip of sand-paper, he makes buds produce as many branches as he chooses. The notion occurred to him in 1849; and he at once made experiments which were successful; and repeating these year by year, he has now produced a new and singularly interesting process of arboriculture. A commission appointed by the Minister of Agriculture and Public Works to examine into it, reported in the following terms of what they had seen in M. Millot-Brulé's gardens:—'Several peach-stems present a multitude of branches proceeding from the same centre with mathematical regularity and symmetry. By skilful shudding by incisions, and nipping of the buds or shoots, he arranges the trees in a way at once the most picturesque and fantastic. Under his fingers, the obedient branches assume the most varied and elegant forms: he increases the fructification, and develops the formation of buds according to his wish.'

Thoroughly to illustrate the results, diagrams would be necessary; we shall, however, endeavour to explain as clearly as the subject will admit of. M. Millot-Brulé's elementary figure consists of a straight branch which from one common centre separates into fifteen branches, resembling, in fact, a small tree with a regularly formed head. A second represents an espalier peach-tree, the branches of which radiate in the form of a wheel, each branch terminating in an oval ring of smaller branches, developed at regular intervals. From these simple forms, others of a more complex nature may be produced: a single stem, properly managed, will form a square, a parallelogram, or a series of circles, so elegant in design, that if copied in papier mâché they would be prized as graceful ornaments for the drawing-room. The buds may be multiplied and the branches sent off entirely at the pleasure of the cultivator; hence there is no limit to the forms which may be produced.

In the course of his experiments, M. Millot-Brulé discovered another of the interesting secrets of arboriculture—namely, that little branches must not be developed immediately opposite each other on a horizontal branch trained against a wall or on stakes; and the reason is, that the branches which run upwards take up all the sap at the expense of those running downwards; the latter consequently languish. It therefore becomes absolutely necessary to develop the small branches alternately—each lower one between two upper ones—on all horizontal branches. It is possible, moreover, to assist the lower branches by bending the upper ones upon themselves, making them form a sort of knot, but always with the precaution of leaving the extreme points in an upward direction.

Any intelligent person may, by a little dexterity, become a practised arboriculturist. The process in its simplest form appears to be to decapitate the buds with a penknife as soon as the sap begins to circulate in the spring. In a few days, two new buds appear at the base of the bud thus operated on, and the vegetation of these is easily equalised by expert trimming, or pinching off when necessary. The equilibrium once established, these two buds may be similarly treated, and as each

will produce two more, any number of branches may be obtained, and a thick full head developed on the top of a single stem. To make branches shoot in different directions, the terminal bud of the main branch is pinched at one side or the other, according as the direction required is to the right or left; and the new buds being pinched in turn, perfect control is established over each branch from its very earliest growth. We pretend not to enter into the minute details that would be requisite in a horticultural publication; all we purpose is to convey some general notion of what strikes us as a remarkable discovery.

Wires are used when necessary to maintain the branches in a proper position; and from this point we are led to a consideration of practical use and value. This method of multiplying branches, being introduced into nurseries, the trees grown will be more fruitful and less irregular in form than heretofore. Who would not rather see a shapely tree than a straggler! It will enable landscape-gardeners to make single trees, or groups as ornamental as they please. Parks may thus become more beautiful than ever, and public walks, boulevards, and the like, may be decorated according to taste or fancy. There are many persons who will perhaps say that trees are most beautiful when left entirely to nature; but they forget that nature sometimes produces vegetable as well as animal deformities, and that it must therefore be an advantage to be able to encourage gracefulness.

But M. Millot-Brulé's method admits of an immediate and eminently useful application—namely, that of controlling the form of branches in plantations grown for their timber. In agricultural implements, in ship-building, fancy cabinet-making and carpentry, as well as in other employments that will suggest themselves to the mind, angular, forked, and bent timber is an article of prime necessity. What an advantage is gained to the grower when, using his judgment, aided by a penknife and a slip of sand-paper, he can make the trees under his care obedient to his will! Moreover, it appears to us that in this process we have a new field open for the exercise of ingenuity, out of which may follow new employments for industry; and we commend the subject to all who are engaged in the culture of trees.

For the substance of the foregoing, we are indebted to a scientific periodical published in Paris.

THE BIRD IN THE STORM.

THE rain was falling, the winds were calling,
The clouds swept over the sky,
When 'mid the alarm of darkness and storm,
A shower of song swept by—
Says the little wee-bird:—'Tis I!

'Ah! is it not dreary, and are you not weary,
Poor little wee bird?' I said.
'How lonely and queer you must feel out here,
Just under the tempest-dread—
Ah! birdie, you'll soon be dead!'

'While the storm is ringing, is my time for singing,'
Says the little wee bird to me;
'Though the clouds be dim, yet I warble my hymn;
And I die not, though cold it be;
For my name it is Hope,' says she.

So the song it is gushing, and seems as if hushing,
The atmosphere tempest-stirred;
Softly and clear it falls on the ear,
Through clouds and through darkness heard—
The song of the sweet wee bird! F.

COMMON-PLACE PEOPLE.

THE very good and the very bad among mankind, albeit they form the ordinary humanity of most novels, are rare in actual life. If we descend from the heights of rose-coloured romance to the sober gray valley of this work-a-day world, we shall find that there is generally some saving-clause of good in the wicked, some fault or failing in the virtuous, to redeem the one from absolute atrocity, and the other from complete perfection. There is happily a medium between all extremes, and human beings are not half of them guileless lambs, and the other half exultant wolves ready to pounce upon them, as romancists would have us believe. Moreover, even the modified heroes and villains of real life form but a very small portion of the world's *dramatis personee*. The vast body of mankind consist of those who are neither detestably bad nor admirably good; overwhelmingly clever, or pitifully stupid—of the *commonplace*, in a word. It is they who leaven society, as it were, and render it of a due consistency; it is they who act as the chorus to the drama, the background to the picture, and who, though not heroic themselves, are necessary adjuncts to the heroism of others.

It is wisely ordered thus, and the more so that all these supernumeraries in the great drama of life have little dramatic episodes of their own, whereof they individually are the heroes and heroines. No one is insignificant to himself; and the most common-place being in the world would assuredly be the last person to suspect the small degree of his own value in the social scale. On the contrary, your ordinary sort of man generally believes himself to be a Napoleon, a Shakespeare, or a Newton, according as his tastes and pursuits are military, literary, or scientific. Often, too, the world is partially deluded into the same belief; for it is a credulous world in some respects, and when it sees a man holding implicit faith in himself, it is very apt to appraise him by his own standard. It is astonishing to think of the number of people who are held to be wonderfully clever, not to say genuine, simply on the strength of their personal conviction that they are so. They have never done anything to prove it—never will, probably; but they have the benefit of the *prestige* now, and will carry it with them even to the grave. Did any one ever know a doctor who was not termed 'a remarkably skilful man?'—or a lawyer, who was not accounted a *shrewd*, talented fellow?—or a clergyman, who was not pronounced to be either most eloquent or most excellent by a sufficient number of individuals to constitute a *Public*? In fact, if we might believe in all the

opinions we hear, talent is the rule, and want of it the exception, in this present age. Men and women of intellect are the commonplace; the only moderately intelligent and the stupid are the few—the *rare ones*.

But we—you and I, reader—don't believe all we hear, and we know better of what calibre of humanity the various classes of the commonplace are actually composed. We know, too, how often 'the world'—principally made up of those very classes, we remember—is mistaken in its judgments, 'as to who are, and who are not, common-place people. We have marked numerous instances when it has done honour to the daw in peacock's feathers, and when—to carry out the ornithological comparison—it has neglected or despised the nightingale, because it was so brown and homely a bird to look at. Was it not only the other evening, at Lady Ormolu's dinner-party, that Mr Jones, after conversing through one course and a half with his left-hand neighbour, pronounced him, in an aside to the lady on his right, one of the dullest, most inane, and most common-place individuals? And was not the said Jones put to the blush when he was informed that his dull and inane acquaintance was the world-renowned artist, whose pictures are known, admired, and prized by all Europe? Be more cautious another time, Mr Jones, in forming your opinion of strangers, and, for your reputation's sake, be less precipitate in expressing it when formed. Do not again judge a man's intellect after half an hour's conversation with him, particularly at a dinner-party. Perhaps it requires not a large intellect, but a little one, to constitute the stock in trade of the sayer of smart things and agreeable nothings, who is so valuable an adjunct to assemblies, and who is pronounced 'a most clever, pleasant person' by Mr Jones and others.

'Appearances are deceitful,' say the school-copies. It is to be feared that the round-text moralities of the writing-master make but a small impression on the minds of youth, or that it soon wears off; for when boys grow to man's estate, they are apt to run exactly counter to the excellent advice contained in those pithy little sentences. How many people of our acquaintance do *not* judge from appearances? Let a man quote from one or two abstruse books, interlard his conversation with Latin and Greek, comb his hair but seldom, and shave still less frequently, and he will find a sufficient number of persons quite ready to admire him as the wisest, most erudite of men. In the same way, a man who dresses well, speaks with respectful regard for Lindley Murray, and does not outrage the *bien-séances*, is considered and denominated a *gentleman*. Well; perhaps after all, it is a wise world to be so credulous! If the outside is fair, let us be

content with *that*, without seeking to look deeper. Let us believe in the talent of one person, the amiability of another, just as we do in the solidity of our rose-wood tables. Let us banish the consciousness that they are only veneered, and that if we cut into the wood, we shall find that the polish does not extend beyond the surface. At anyrate, I, who am an unappreciated, and therefore a cynical being, have resolved to do so for the future.

But *revenons à nos moutons*—that is to say, to our common-place people. As I have indicated, I hope, by the foregoing anecdote of Jones, the balance is kept tolerably even. If one set of people are over-rated, the really talented, the unquestionably superior, are often treated very shabbily by that great autocrat, public opinion. I myself am thought little of by ordinary minds. As I have said, the world is principally made up of common-place people, and it naturally seeks its heroes from among its peers. *Parmi les aveugles les borgnes sont rois*. People with two eyes have no chance.

However, I will add—for I like to be impartial—that my wife, who is of a more genial temperament than I am, takes altogether another view of the subject. She thinks—I put it into elegant language for her, as she is not literary—that commonplaceism *per se* does not exist. Everybody is interesting to some one or two others in the world; for instance, every man who has a mother has some one to admire and love him—to think him a hero or a sage—most handsome, most clever, or most excellent in some way. He is never commonplace to *her*. Moreover, my wife declares her belief, confirmed by observation, that if we could thoroughly understand the idiosyncrasy, or be made intimately acquainted with the *lives* of even those people we ourselves are apt to decry as commonplace, we should be sure to find special individualities, both of thought, and feeling, and action, to redeem them from the character. Therefore, she triumphantly concludes, since the world's common-place people are *my* heroes, and my common-place people are very often God's heroes and heroines—where are we to find the absolutely commonplace?

I am to remember, she says, my old-bachelor cousin Harte, whom I always used to wonder at, as the most perfect specimen of human clock-work, wound up to go to the bank daily, write there for six hours, and return to his lodgings—and who couldn't do anything else, I verily believed, except potter about the back garden of his lodgings, read the newspaper, and cut out a man with a cocked-hat, in card-board, to amuse the children, when he came to us to tea. Well, how was I to know that all that time he might have been put into a book as an example of constancy, courage, and all that sort of thing? I hardly knew that such a person as Anna Lyle existed, much less that they had loved each other ever since they were boy and girl together. But they were both poor, and Anna had a helpless father dependent on her for support; so they both worked on, loved one another, and had patience. They were middle-aged before they married. Yes, I remember I *was* astonished when Harte quietly introduced his wife to us, and for the first time I noticed something in his face. In fact, I've not thought him at all commonplace since.

I confess, also, that I never thought much about little Charlotte Selby—one of Selby the merchant's three daughters. Her elder sister was the more accomplished, and the younger was far handsomer. She appeared to me a very ordinary kind of medium, in age, looks, and abilities. I never should have suspected her of the quiet energy, the sense and courage she displayed when her father failed, and the family were reduced to much poverty and privation. She was the mainstay and support of all the rest through the whole trying time that the broken-down

merchant was struggling with his difficulties. The clever sister made money by her pen; the handsome one, who had married brilliantly, helped the fallen family, as she should; but I admit at once that I admire and respect little Charlotte far beyond either the authoress or the beauty, though they are both good women in their way.

Further, I am reminded—But my wife's examples would be endless. I shall name no more. I submit to her so far as to own, that there may be plenty more Hartes and Charlottes among my common-place acquaintance, even among those that I grumble at when they are invited to tea, and call 'limpets' and 'pumpkin.' Yes, yes, anything and everything she says is true, no doubt.

I deny nothing—and I shall not go over my own case again. Judge between us, O reader, and decide for thyself upon this knotty question.

GLIMPSES OF AFFAIRS IN AMERICA.

HOW IT CAME ABOUT.

In the dashing times which produced the Declaration of Independence, and opened up the most glowing anticipations of a political millennium, in which we were to 'hold these truths as self-evident, that all men are created equal—that they are endowed by their Creator with certain inalienable rights—that among these are life, LIBERTY, and the pursuit of happiness'—we say, in the midst of these announcements of a brighter day for hitherto down-trodden human nature, and of what was actually done towards founding a great republic, who could have foreseen that in eighty years the result would be a state of things in which a sixth part of the population would be slaves—human beings of every variety of complexion and diversity of intelligence, placed, from no fault of their own, on a level with the brute creation; and further, that this sorrowful and abject condition would come to be extended, perpetuated, vindicated as an essential element in civil society! The world, as it appears to us, has hardly awakened to a consciousness of this historical anomaly; and this is not surprising, for the Americans themselves are as yet only beginning to see the awkwardness of the dilemma into which they have allowed themselves to be drifted.

It was from no qualm of conscience on the part of the committee appointed to draw up the Declaration—Jefferson, Adams, Livingston, Sherman, and Franklin—that the passages relative to slavery were struck out from the celebrated document. 'He [the king of Great Britain] has waged cruel war against human nature itself, violating its most sacred rights of life and liberty in the persons of a distant people, who never offended him, captivating and carrying them into slavery in another hemisphere, or to incur a miserable death in their transportation thither. This piratical warfare, the opprobrium of infidel powers, is the warfare of the Christian king of Great Britain. Determined to keep open market where men should be bought and sold, he has prostituted his negative for suppressing every legislative attempt to prohibit or to restrain this execrable commerce.* &c. It was quite as well that these ungente accusations should have been withdrawn in consideration, as is said, for the feelings of southern members of the infant confederacy; that so there might remain no historical doubt of the fact, that Union was secured only by conciliating the more intractable order of

* The first draught of the Declaration of Independence, embracing these erased passages, is shown in the rooms of the American Philosophical Society in Philadelphia, an institution founded by Franklin. It was the greatest archeological curiosity (if such a term be allowable) which the present writer saw in the United States.

slaveholders. Whatever, therefore, may be our surprise at the present anomalous complication of American liberty and slavery, the marvel would seem to be lessened by the explanation, that from the very commencement, on that memorable 4th of July 1776, when the Declaration of Independence was read from the steps of the city-hall in Philadelphia, there never has been a condition of universal freedom. The Declaration, doubtless, propounded the doctrine of human equality; but this document never seems to have had the validity of law. At all events, as regards the principle of slavery, the lofty preamble of the Declaration about 'inalienable rights' has proved to be only a respectable piece of *Bunkum*—words which serve their purpose, and signify nothing.

At the opening of the revolutionary war, there were slaves in all the revolted colonies; even in Massachusetts, the land of the 'Pilgrim Fathers,' there were slaves, and sales of slaves too. England, of course, must be charged with the crime of having, in the first instance, introduced these unfortunate Africans as an article of merchandise into the plantations against the repeatedly expressed wishes of the settlers, and of having fostered slavery till it took root as a social usage. Lawyers might now speculate on the question—whether, at the period of the revolutionary troubles, slaves could be legally held in the colonies? A short time previously, it had been decided by courts of justice, that a slave landing in England became free; and as the common law was extended over all parts of the realm, it is demonstrable that the maintenance of slavery in distant dependencies was, to say the least of it, open to challenge. The question was not, however, tried; and, as is well known, a vigorous English slave-trade was carried on for many years afterwards with the West Indies and other possessions—much to the profit of Liverpool and Bristol, and apparently to the satisfaction or indifference of all, except the few individuals who deigned to feel an interest in the unhappy objects of ruthless deportation—which individuals, as is usual in such cases, were set down as visionaries, crack-brained enthusiasts, who had no proper regard for national greatness. When the House of Commons was at length induced, in 1792, to pass a bill for the suppression of the slave-trade, it was rejected by the House of Lords, on the ground of its damaging effects upon great commercial and colonial interests. As the famous abolition act did not pass till 1807, and the trade did not absolutely cease till the 1st of January 1808—as, in fact, slaves were held in the colonies until our own times—and, what is still more to the point, as our continued national prosperity depends in no small degree on the purchase and manufacture of slave-grown cotton—the English have not much reason to be boastful on the subject.

For several years after the termination of the revolutionary war—1784 to 1789—the Americans had no proper federal constitution, and public matters were regulated during this interregnum by what was called the Continental Congress, sitting in Philadelphia or New York. To have anything like a correct notion of the American slave question, we need to look back to the operations of this august body. One of the subjects that fell under its discussion, was the management of certain western territories which several states relinquished for the benefit of the general commonwealth, in consideration that congress should liquidate debts and obligations incurred by these states during the war. The cessions were made on these terms; and congress henceforth exercised a direct sovereignty over large tracts of country, from which new states could be excavated. Plans for the government of the Western Territory occupied considerable attention; Mr Jefferson apparently taking a lead in the business, and producing schemes by which slavery was never to be intruded into this vast region. A

proposal of this nature was lost on coming to a vote; but at length, in 1787, in the last continental congress, was passed an 'Ordinance for the Government of the Territory of the United States, North-west of the Ohio,' which embraced this provision: 'There shall be neither slavery nor involuntary servitude in the said territory, otherwise than in punishment of crimes, whereof the parties shall be duly convicted.' The enactment of this law may be said to settle the point, that congress is entitled, among other regulations, to enjoin that slavery shall or shall not be a constituent element in the Territories under its special jurisdiction.

The circumstance of Jefferson not being able to carry his larger measure, which comprehended territories south of those just mentioned, shews that the leading men of the time were cramped in their benevolent efforts to extend the sphere of freedom. They were thoroughly aware that slavery in any form, or wherever situated, was a bad thing; and on suitable occasions, they spoke plainly out on the subject. Not disguising the fact from themselves or from others, they nevertheless thought proper to temporise. Believing that any attempt at emancipation through federal agency would probably alienate slaveholders, and so jeopardise the consolidation of the States, they were inclined to leave the subject to the action of public opinion, of which there were hopeful symptoms. As early as 1775, the representatives of a district in Georgia passed a resolution, declaring their disapprobation and abhorrence of the unnatural practice of slavery in America—'a practice,' they say, 'founded on injustice and cruelty, and highly dangerous to our liberties, as well as lives; debasing part of our fellow-creatures below men, and corrupting the virtue and morals of the rest; and as laying the basis of that liberty we contend for on a wrong foundation.' Other anti-slavery sentiments shine out during the ensuing ten years. Massachusetts and other New-England States, and also Pennsylvania, denounce slavery, provide for securing freedom to all born after a certain day, and prohibit the import of any more slaves. Virginia likewise prohibits importation, and removes legal restrictions on emancipation. From North Carolina, New York, and New Jersey, are issued edicts against the further import of slaves. In short, it appears as if slavery was everywhere about to be given up, and done with. Some expectations of this kind, along with an anxiety to conciliate doubtful friends, afford the only excuse for the perpetuation of slavery under the constitution. With a distinct consciousness of its injustice, its dangers, slavery was recognised under ambiguous terms—singular anomaly!—in the great charter of republican freedom. It was competent to repudiate it; it was advisable to maintain a discreet silence respecting it. Neither was done. Here lies the first great blunder of American statesmanship, never to be rectified. The constitution was framed in 1787, and was in general operation in 1789.

This constitution, which still gives cohesion to the States under a federal government, is an instrument divided into articles, each subdivided into clauses. The passages referring to slavery are as follows: In the second clause of the first article there is a provision for representation and taxation—'Representatives and direct taxes shall be apportioned among the several states which may be included within this Union, according to their respective numbers, which shall be determined by adding to the whole number of free persons, including those bound to servitude for a term of years, and excluding Indians not taxed, three-fifths of all other persons.' By 'all other persons' is signified slaves. Accordingly, in whatever state slavery exists, there is till this day a statutory method of making up an artificial constituency: in other words, the number is swelled by counting slaves; but

as the slaves have no vote, it happens that a limited constituency of free white persons possess a political power equal to that of a constituency altogether free. That so acute a people as the Americans should have accepted this as a fair thing in representation, and still submit to it, almost passes belief. To proceed, however. The next reference to slavery in the constitution is contained in another clause of the first article—'The migration or importation of such persons as any of the states now existing shall think proper to admit, shall not be prohibited by the congress prior to the year 1808; but a tax or duty may be imposed, not exceeding ten dollars on each person.' By one of the clauses of the fourth article, it is ordained that 'No person held to service or labour in one state under the laws thereof, escaping into another, shall in consequence of any law or regulation therein be discharged from such service or labour, but shall be delivered up on claim of the party to whom such labour may be due.' The use of such ambiguous terms as 'persons held to labour,' leads one to infer that the fathers of the constitution were ashamed of the thing indicated. In the face of mankind, and fresh from a successful struggle for liberty, they do not appear to have had the courage to employ a candid phraseology. Be this as it may, the constitution had taken its ground in maintaining the rights of slaveholders. They could hold persons to service, pursue and secure them if they fled; and at least until 1808, they could migrate with them to new possessions, and receive fresh supplies by importation.

Possibly, the national conscience felt no alarm in adopting these legal institutes. All were jubilant over late successes. A mighty power three thousand miles off had been humbled; 'glory,' as Emerson says, had been 'bought cheap.' The new republic could afford to lecture England—which, we are thankful, has always been able to stand a good deal of sound scolding—on the doctrine of inherent human rights. In the address of the first congress under the constitution, to the people of Great Britain, what grandeur in the passages about liberty, oppression, slavery, and chains. 'When a nation, led to greatness by the hand of liberty, and possessed of all the glory that heroism, munificence, and humanity can bestow, descends to the ungrateful task of forging chains for her friends and children, and instead of giving support to freedom, turns advocate for slavery and oppression, there is reason to believe that she has ceased to be virtuous, or has been extremely negligent in the appointment of her rulers.' With such remonstrances against wrong-doing, which seem as if addressed to the living generation of Americans, who could suppose that this same congress required to be reminded that a section of the population was still deprived of its rights? As president of the Abolition Society of Philadelphia, Franklin signed a memorial to the first congress, praying that the blessings of liberty may be rightfully administered, 'without distinction of colour,' and that congress would be pleased to countenance the restoration to liberty of those unhappy men, who alone in a land of freedom are degraded into perpetual bondage.' We all admire the philanthropy breathed in these words; but are unpleasantly reminded that Franklin, with his compatriots, would perhaps have acted more wisely in not constitutionally sanctioning a thing which required afterwards to be spoken of in terms of reprobation.

Let us, however, not bear too hard on the first congress, which in 1789 set a worthy example for future legislation. If the constitution had given congress no power to meddle with slavery in any of the states, it had at least enabled it to regulate the affairs of the territories, from which, both by law and precedent, slavery could be peremptorily excluded. This congress accordingly 'recognised and affirmed the doctrine, embodied by Jefferson in the ordinance of 1787, which for ever excluded slavery from the territory

that now embraces Ohio, Indiana, and Illinois; and in 1800, the same doctrine was approved by John Adams in the Territorial Act for Indiana.*

Kept as yet within bounds, and no means being immediately adopted to push slavery beyond certain old limits, the number of 'persons held to labour' in the United States, in 1790, was only 697,897; and as their average market-value was then comparatively small, there could have been no insurmountable difficulty in providing means for their liberation on equitable terms. But no effort of this kind required to be made. The progress of local emancipation which was clearing slavery from the northern, would soon remove it from the middle states; and all that the legislators of the day were called on to do, was to adopt such measures as would prevent slavery from extending and intrenching itself permanently in the south. Neglectful on this point, all was lost.

Engaged in the task of establishing a great nation—building cities, reclaiming wildernesses, opening up channels of internal communication, extending commerce, planting churches, schools, printing-presses, and other engines of civilisation; successful in almost all arts, and flourishing beyond the hopes of the wildest imagination—the Americans never seem to have attained a clear consciousness that there was any lurking possibility of social dislocation in consequence of slavery being tolerated within their political system. Not that there has not always been a party who augured danger from this quarter; but in the main, things have been left to take their course; or more correctly, the nation has, with singular indifference, seen a series of events successively and more and more hopelessly interweave slavery with the constitution.

It was, we believe, a crotchet of Washington that the federal capital of the United States should be a city removed from popular influences—as if there was any imaginable Olympus from which the pleasant constitutional practice of *Lobbying* could by any stratagem be excluded. New York would not do. Philadelphia—more the city—would not do. There must be a metropolis standing alone in virtuous solitude, somewhere about the centre of the Union. Accordingly, a site was pitched upon, on the banks of the Potomac, the contiguous states of Virginia and Maryland severally resigning a patch of a few miles square for the purpose, henceforth called the District of Columbia. When Washington here planned and built the city which bears his name, he could not have had any great horror of slavery, although he would much rather there had been no such thing in the world. Virginia and Maryland were then, as now, slave states. Slavery accordingly remained in the District of Columbia, as if indigenous in the soil; and from this time the supreme authorities of the United States became the civic magistracy of a kind of miniature independent state, in which slavery was a recognised institution. It could be shewn that this plantation of a political metropolis in the bosom of slavery did much disservice to the cause of freedom—the sight of slaves, slave-dépôts, slave-sales, and the looseness of morals usual in communities affected by slavery, producing no good effect on representatives from the free states. It might be argued that, as Columbia was surrounded by slave states, freedom within this small domain was impracticable. That, however, is not the question. The thing to be deprecated was, making federal authority responsible for an institution which American writers never cease to represent as belonging exclusively to the states in their individual capacity. If any one up till this time imagined that slavery was independent of national administration, his faith, we think, must have received a considerable

* *America Free, or America Slave—Address to the Citizens of Westchester.* By John Jay, Esq.

shock. There were remonstrances, but they sunk and disappeared under a general acquiescence.

We are now referring to the close of the last and beginning of the present century, and shortly afterwards came an event far more serious than the organisation of the capital of the Union. This was a vast accession of new territory on the south and west. Left to themselves, with a wide continent invitingly open for acquisition, the Anglo-Americans only seemed to fulfil an obvious destiny in carrying their flag beyond the limits of the colonies which had been left from the British crown. A favourable opportunity for making a large acquisition occurred in 1803, when the French under Bonaparte offered to sell the province of Louisiana, which embraced pretty nearly the whole Valley of the Mississippi. A little better management on the part of England would perhaps have saved the French the trouble of bargaining away this valuable foreign possession, which they could no longer keep; but as Louisiana was not so secured, it fell naturally, and we must say justifiably, into the hands of the Americans. The purchase, which was made for the sum of fifteen millions of dollars, excited the first of that series of struggles in congress between north and south, which has lasted till our own times. The country acquired, was already settled in its lower part with French slaveholders engaged in the culture of sugar and cotton, and covered an area of about 900,000 square miles—a space larger than all the old thirteen states put together, and including the territories of Missouri, Kansas, and Nebraska, which have latterly engaged so much angry disputation, and caused no little bloodshed.

On the one hand, it was scarcely in human nature to resist the easy acquisition of so splendid a domain; on the other, there were not unreasonable fears among northern politicians that the addition would in some way imperil the security of the Union. Prognostications of disaster, remonstrances, legal doubts, availed not against the controlling desire for national greatness. It mattered not that Washington, in his farewell address to the people of the United States, had uttered the solemn warning—'Let there be no change from usurpation.' It mattered not that Jefferson, at the time president, shewed argumentatively that 'the constitution has made no provision for our holding foreign territory, still less for our incorporating foreign nations into our Union,' and intimated that the acquisition of Louisiana 'would make the constitution blank paper by construction.' Against his better judgment, Jefferson acquiesced in the opinions of those who differed from him, and passed the bill which incorporated Louisiana with the Union. No provision was made for excluding slavery from the ceded territory: the inhabitants, on the contrary, were insured the enjoyment of all their existing property, rights, and privileges; and as the holding of slaves was one of these immunities, it continued, as a matter of course, to be incorporated with the public policy.

The passage of the Louisiana Bill has been justly referred to as the turning-point in the history of the states. It at once and for ever reduced the northern and free communities to an inferior political position, and gave an immense preponderance to the slaveholding interests of the south. In accounting for so extraordinary a change in affairs, the future historian will probably point to other reasons besides the vulgar outcry for national enlargement. He will doubtless find occasion to lament the decline of public spirit. Whether it be that Providence at certain periods sends great men into the world to accomplish particular purposes; or that such at all times latently exist, and are developed into notice by national convulsions; or, to hazard another alternative, that republics are not favourable to the growth of prominent individuals, the fact is undeniable that the great men who effected the

American and French revolutions, and who, be it remarked, were bred up under monarchical rule, left behind them no equals in magnitude of intellect or indomitable force of character. It is true that several persons who figured in the commotions of '76 were still on the stage when the Louisiana Bill came under discussion; but there was now a general collapse in heroism; intrigue took the place of patriotic ardour; the men of the north, for the sake of material interests, succumbed to a course of treatment, which their more sturdy ancestors would not have endured from an English ministry. Unfortunately, also, a deterioration of manners was visible among slaveholders. The gentlemanly spirit of the old planters was passing away. Virginia was beginning to be 'overrun by time-servers, office-hunters, and political blacklegs.' Power was subsiding into the possession of this disreputable class of personages. Nor, all things considered, could much else be expected. Certain radical mistakes, as had been seen, were committed in the general terms of union. The constitutional recognition of slavery had fixed and given breadth to the institution. The very slaveholders had secured a franchise to which nothing corresponded in the north. For the free states, as has been shewn, representation is based purely on a free population, whereas in the slave states it is founded to a large extent on property in slaves; consequently, a mere handful of slaveholders—only 350,000, it is said, altogether, along with their indigent and easily influenced white neighbours—are able to exert a direct power in the House of Representatives, approaching that of the wealthy and populous free states, numbering in 1850 a population of 13,380,650 whites. Of course, such a flagrant piece of injustice could not have been tolerated for any length of time, had the north been true to itself. But this, as we may afterwards have occasion to particularise, it has never been—a large proportion of northern men having on all occasions cast in their lot with the political party represented by the more imperious aristocracy of the south. With such facts before us, can we feel surprise at the passage of the Louisiana Bill, and all subsequent bills of the same nature? Freedom had been delivered up, bound hand and foot, to the interests of slavery, and all that followed was a natural consequence of this fundamental error. We are justified in these opinions by the remarks of the venerable Josiah Quincy, a survivor of the youthful era of the republic. In his late admirable address on this subject, he says: 'The passage of the Louisiana Admission Bill was effected by arts which slaveholders well know how to select and apply. Sops were given to the congressional watch-dogs of the free states. To some, promises were made, by way of opiates; and those whom they could neither pay nor drug were publicly treated with insolence and scorn. Threats, duels, and violence were at that day, as now, modes approved by them to deter men from awakening the free states to a sense of danger. From the moment the act was passed, they saw that the free states were shorn of their strength; that they had obtained space to multiply slaves at their will; and Mr Jefferson had confidently told them that, from that moment, the "constitution of the United States was blank paper;" but more correctly, there was no longer any constitution. The slaveholders, from that day, saw they had the free states in their power; that they were masters, and the free states slaves; and have acted accordingly. From the passage of the Louisiana Bill until this day, their policy has been directed to a single object, with almost uninterrupted success. That object was to exclude the free states from any share of power, except in subservience to their views; and they have undeniably, during all the subsequent period of our history (the administration of John Quincy Adams only excepted) placed in the chair of state either slaveholders or men from the free states who,

for the sake of power, consented to be their tools—"Northern men with Southern principles;" in other words, men who, for the sake of power or pay, were willing to do any work they would set them upon.*

With the widening scope for slave-labour opened up by the passage of the Louisiana Bill, also the contemporary extension of slavery over portions of the southern states, it will not appear strange that in 1810 (notwithstanding the removal of the institution from several states, and the stoppage of the foreign slave-trade in 1808), the number of slaves in the Union had increased to 1,191,864—a significant commentary on the hallucinations of the patriot founders of the republic. W. C.

THE MUTINY OF THE GRANT HIGHLANDERS.

BY ONE OF THE MUTINEERS.

BEFORE entering on the subject in hand, the reader will be pleased to bear with me while I give a brief relation of the circumstances which brought me in connection with the Grant Highlanders, and of the doings of the regiment previous to the mutiny.

I am one of those unfortunates who never saw their father. Mine died a week before my birth, and my mother married a discharged soldier six months afterwards. Poor woman!—happy would it have been for her, and for me too, had she remained faithful to the memory of her first husband, for the cruelty and debauchery of her second sent her to an early grave, and drove her boy forth a wanderer from the home that should have sheltered him. Thus, while yet a parent's guiding hand should have been with me, I was cast upon the mercies of a strange world, and forced to take an active part in the great battle of life.

After struggling with difficulties such as only the friendless have to encounter, I at length reached that period which was to mark my future destiny. This was in 1794, when I would be about fifteen years of age, tall, strong, and prematurely manly. Sir James Grant was then engaged in raising a new regiment—the 97th, or Grant Highlanders; and many lads from the district in which I lived—a lonesome valley in Inverness-shire—enlisted under his banner. At first I felt no desire to follow their example, for the remembrance of a certain red coat, which at one time lay in a drawer in my mother's kitchen, and which had engendered a dislike to all soldiers, now arose vividly before me. One beautiful spring morning, however, as I was tending cattle on an upland pasture, there came floating on the freshening breeze, which hurried oceanward, sounds of distant music. I was wondering and debating with myself whence they proceeded, when suddenly I beheld a numerous band of red coats emerge from the gorge of a gloomy valley at an angle of the hill whereon I was standing. It was a glorious sight to my young eyes that first beholding of a regiment of soldiers, as rank by rank they issued from the darkness into the sunshine, which fell, as it were, in showers of glory on their scarlet array!

On, on they came, and the merry roll of the drum set my heart dancing. My whole nature seemed to undergo a revolution. Old antipathies were forgotten, and giddy with delight, I hastened down the hill to meet the approaching Highlanders, for it was Sir James Grant's new regiment on the march to Fort George.

In the mood of mind which possessed me, it required no 'oily tongue persuasive' to induce me to become a king's man, nor had I before my eyes the fear of breaking the heart of a poor old mother, or that of a sweetheart, therefore I readily accepted the shilling

which Lieutenant Macdonald offered me. Sending my dog, Chance, off to watch the cattle until a more trustworthy servant than I should come, I marched away with a swaggering air from the hills of my boyhood, never more to behold them, except through the dim mists of the far away.

Drill, drill, drill!—months of continuous drill, and then we were pronounced fit for duty. In the summer of 1794, we, together with the Gordon and Seaforth Highlanders, sailed from Fort George for Southampton in England. We had scarcely got settled in our new quarters ere we got the route for the island of Guernsey, where we passed a miserable winter—our duty being onerous, rations scanty, and the weather severe. Glad, indeed, were we when the spring of '95 saw us once more safely located on the shores of Old England.

But there is no rest for the wicked. Government having now more need of our aid on the sea than on the land, bethought themselves of rendering us available as sea-soldiers; and in conformity with this idea, we were lent, as it were, for a short season, to the marine service.

In our new character, we joined the Channel-fleet under Lord Bridport. To us it was a mere pleasure-cruise, until the 21st of June, when a frigate brought us intelligence that the enemy's fleet was out; but, much to the chagrin of Jack, a heavy gale was blowing at the time, which forced us to remain inactive, and to tack about, under easy sail. At midnight, however, the wind somewhat abated, and by the first streaks of morning, we descried the enemy right ahead. Cheer after cheer rent the welkin, as his lordship's signal for a general chase and to prepare for action flew forth to the breeze. On board our wooden bulwarks all were as lifeless and mirthful as if they had been hastening to a bridal-feast—and so they were—but Death, unthought of, was the bridegroom.

The chase continued all that day and night, for the gale had lulled to a dead calm; and as screws were then unthought of, our progress was slow. O how we did whistle for a few puffs of our late visitant the gale! At four in the morning of the 23d a fine breeze sprung up to our whistling, and ere two more hours had passed, the French were brought within range of our long Toms. The *Irresistible*, the *Orion*, the *Robert*, and the *Colossus*—on board of which last vessel I was—being the headmost ships-of-the-line, were the first to enter into action.

This was the first fight in which we Highland marines had been engaged. We certainly did feel strangely out of our element, cooped up within wooden walls, unable to dash forward at once to the charge.

It is strange how quickly the mind assimilates itself to the spirit which prevails around. At first, there was a slight tremor of fear mixed with my courage; and the sight of the mangled bodies and limbs of my mates well-nigh sickened me. But the stir and bustle of the battle, the thunder and glare of the cannon, and the shouts of the combatants, mingled with the shrieks of the wounded, soon drove my sentimentalism away, and I cheered, loaded, and fired away, as if it had only been a review, instead of a mighty life-struggle in which I was engaged.

The breeze which carried the *Irresistible* and six others into action having failed before the heavy line-ships could come up, the seven had to begin and maintain the fight with fourteen of the enemy. We were beginning to feel two to one rather a little unpleasant, when the tide of battle was turned by the arrival of the others; and as the admiral passed us in the *Royal George*, we welcomed him with three thundering cheers. The battle now was soon over, and we were left in possession of the *Formidable*, 80; *Le Tigre*, 80; and the *Alexandre*, 74 guns.

About forty of my comrades were among the killed

* Address Illustrative of the Nature and Power of the Slave States, and the Duties of the Free States: delivered at Quincy, Massachusetts, June 5, 1856. Boston: Ticknor and Fields.

and wounded; but to me Providence was kind—I came out of the fight without having received a scratch. Our ship, besides receiving numerous damages of a minor character, had her main top-mast shot away, and the mizzen greatly shattered. The *Prince of Wales*, the *Robert*, and the *Orion*, being also considerably damaged, were ordered, along with us, into port with the prizes, to get repaired.

On landing at Portsmouth, we were quartered in Hilsa Barracks. We mustered at this time about 1200 men altogether. This number being considered by those in power too many for one battalion, the regiment was divided into two, one of which was sent on board the hulks to guard the prisoners, while the other was left on shore to do barrack-duty. The latter division, to which I belonged, soon after received orders to be drafted for the marine service solely. To a man we refused to go—arguing that, having enlisted for the land service, we were determined not to be forced into any other. Hearing of our refusal to comply, General C——, the governor, came among us next day, and threatened compulsion unless we succumbed; but we only laughed at his threats, and were the more resolved to hold out for what we conceived to be our rights. Letters were privately conveyed to those on board the hulks, requesting them to join us without delay. They lost no time in doing so: that same night they secured the prisoners by closing the hatches, and before morning, were all safe with us in Hilsa Barracks. Foreseeing how the affair was likely to end, our officers now left us. The governor, of course, was early informed of our proceedings, and a second visit from him was the result. The sergeants, acting in our behalf, told him we were all willing to shed our best blood in defence of king and country, but that no power on earth could compel us to become marines, when we willed otherwise. To be beard thus by a parcel of Scotch vagabonds, as he politely termed us, was more than the old gentleman could bear with equanimity. He left us in high dudgeon, blustering as he went, that before the week was a day older, we would gladly do that which government required us. We guessed what he meant, and prepared accordingly. The party who had been doing duty on board the hulks still retained their ammunition, which was now divided equally among us all.

Next morning at length dawned, and with it came the governor, the 11th regiment of the line, two brigades of artillery, and two troops of dragoons. The call sounded for parade, which we immediately obeyed; and when drawn up in the square, we were once more asked to comply with the king's commands. Despite the vast array of compulsive power before us, we to a man still adhered to our former resolution. The 11th were now placed in our front, supported on either side by the dragoons and artillery. After some little manoeuvring, we were ordered to ground arms, which we did; to march into barracks, which we also did, but were not foolish enough to leave our muskets behind.

'A thousand curses on you, you rebellious Highland crew!' furiously shouted old C——, when he witnessed our doings.

Mad with rage, he commanded the 11th to load, &c. We, too, obeyed him, as if his orders had been addressed to us. We loaded, but not as the poor infantry loaded; they rammed home blank-cartridge—we, ball! Neither the general nor the poor soldiers guessed this, and we as little knew what they used. C——'s object was only to frighten us; but he reckoned without his host. Orders for the last time were now read, and we felt that the critical moment had arrived. Oh, how our hearts beat with anxiety for the issue! At length, the terrible word 'fire' was given, and ere the echo had passed away, shrieks and groans from wounded and dying men rent the murky atmosphere. Comrade

turned towards comrade, and asked how it fared with him, and then it was the fearful discovery was made that our opponents' Fire had been only a sham! Great was their consternation, poor fellows, when they witnessed the havoc which our ball-cartridge had made in their ranks. Long before the smoke cleared away, they retreated helter-skelter from the scene—the gallant general taking the lead.

Here was a pretty fix to be in! The murderer's doom was sure to be each of ours—at least every one felt so, except one old sergeant.

'Plood, men!' exclaimed he, in Highland English, 'what pe ye fear'd o'? She (meaning the governor) pe her nainsel to plain; she cried "fire," and we fired—that was only obeying orders.'

Despite this line of argument, we all felt more or less uncomfortable; but I daresay it was more on account of the dead and the dying soldiers than from the anticipation of any punishment we might receive. An hour was now spent in anxious deliberation regarding our next procedure, when it was finally resolved that we should remain where we were—doing duty as before, mounting guard, &c.; and as our small stock of ammunition was unexhausted, we determined, should a fresh force be brought against us, to act on the defensive, as we fully expected that, if it did come, it would come to kill, not to frighten!

For three days we remained in this state, without any sign of the 'enemy's' approach. Early in the morning of the fourth day, however, Sergeant Halliday, the acting officer of the guard then on duty, was accosted by a military-looking gentleman, who asked:

'Who is the officer on duty?'

'We have no officer,' was the sergeant's reply.

'Who commands the guard, then?' was the next query.

'I do,' answered Halliday, drawing himself up to his full height, as if he were 'somebody.'

'Beat to arms, and turn all out!' imperiously commanded the unknown.

'By whose orders?'

'By the orders of General Abercromby.'

In a twinkling, the call sounded 'To arms! to arms!' and each barrack-room was as quickly alive with commotion. Being very early, very few of us were out of bed when the alarm broke upon our ears, and, as a matter of course, nothing but hurry and confusion prevailed. Here might be seen a multitude fleeing to the yard with kilts, coats, and other articles of dress in their hands—there, a band with their coats on, but no kilt. Particular regard was paid to one thing, however—the musket. None forgot his 'Brown Bess,' although kilt and hose were wanting; for we imagined the 'enemy' were close at hand. When Sir Ralph saw the hurly-burly and sad confusion in which we were, he laughingly ordered us back to our rooms to dress, which order we cheerfully obeyed, after understanding who he was. Being now fully arrayed and drawn up in the square, we welcomed him with three Highland cheers. He then called the sergeants round him, and told them to inform us that he was commissioned by government to get our unfortunate affair settled, and requested to know what our grievances were, pledging his word of honour that we should receive justice.

Through our sergeants, we acquainted Sir Ralph with the whole history of the matter, telling him, as we told old C——, that we were still willing to serve our king and country in the service for which we enlisted, and that we decidedly objected to be changed into marines. He replied, that he was happy to learn that our loyalty remained unshaken, and hoped many of us would join the expedition of which he was on the eve of taking the command. Under the impression that we were to accompany him immediately, we expressed our willingness by making old Hilsa barrack-yard echo with our cheering. But he now told us that

our regiment was disbanded—that we were no longer soldiers—that each was left to follow the bent of his own mind. He trusted, however, that none of us would leave the service. To those who wished to join the marines, a bounty of L.5 would be allowed; and to those who, disliking that service, entered the 42d or any of the other Highland regiments, L.4 of bounty would be given. No fewer than 500 chose the 42d; many, the other regiments; a few left the service entirely; and, notwithstanding our former antipathy, 300 of us joined the marines.

Thus was this serious mutiny amicably quelled by the adroitness of a sensible man. It is a curious history from first to last, and teaches an important lesson to those who have the command of troops. Government had obviously placed themselves in a false position, from which they could not have been honourably extricated, but by the expedient of Sir Ralph Abercromby. So far as I know, the particulars of this affair have never before been given; even Stewart, in his chapter on Mutinies, omitting to notice that of the Grant Highlanders.

RESEARCHES IN THE EAST.

I AM a dweller among the denizens of the east end of London. I am not ashamed to say that I am better acquainted with that unpopular quarter of the metropolis than with the realms of fashion. To me, Mile End is more familiar than Mayfair; I know more of Bethnal Green than of Belgravia. I was born and bred among the vulgar thousands whose existence is ignored by the mighty west, and I have a fellow-feeling for them. It is true, a snug investment I have in the Three per Cents. would warrant me in taking a villa at Baywater, or a lodge at Hampstead; but I prefer breathing my native air, which circles round the pleasant places of Whitechapel—an atmosphere redolent, it is true, of smoke and dust, and effluvium from sugar-bakeries, and sources of a still more questionable character, but still my native air, and therefore deserving my respect. I have made a study of my neighbours; I enjoy an extensive acquaintance with weavers, costermongers, and nondescripts. Every nook and corner of the surrounding district is familiar to me; the most secret *adyta* of that region little known have not escaped my search. Do you wish to know where the pickpockets live, or to find the sleeping-places of the myriad oyster-stalls, or to visit the hidden manufactories of ginger-beer and sherbet, so extensively patronised in the east? I shall be happy, gentle reader, to be your guide.

Let us take a ramble through these narrow streets that fill up the space between Hackney Road and Whitechapel. Branching out into a devious net-work on every hand—house-rows crowded so close upon each other, that opposite neighbours of a friendly disposition may almost shake hands across the street. Plenty of room here for the sluggish smoke to hover; plenty of room for the steaming exhalations from the open channel on each side, where the fetid water lies with prismatic scum upon its surface; but small space for the fresh breeze which *ought* to sweep in, and lift the murky curtain. Ah! it is never so light here as it is everywhere else. In summer, the sun-rays fall with subdued effect; in winter, the fog is densest here, and the smoke least willing to quit possession. In the great cyclorama, this part is 'cast discreetly into shade.' Look at these rows of houses four stories high, with windows nearly as broad as the rooms inside. These are the dwellings of the Spitalfields weavers, about whom there has been so much talk. You do not know that from this unpromising region come forth many of those glossy silks and velvets, whose choice texture and pleasant sheen attract the shoppers in Regent Street, and adorn the patrician

damsels of the parks? If you listen, you will hear the dull clank of the looms, as the weavers work with hand and foot, and drive the shuttle for dear life. You would like to see the weaver at his work? I have a special friend in this house; let us go in. The dwelling is four stories high, two rooms on a floor; there is a family in each room, and the tenants are all weavers. My friend is busy at his loom; he tells me he has been 'at play' for several weeks, and now he has a large quantity of work to finish by Saturday morning. He must work day and night to get it done. He has a cheap newspaper before him, from which, when the silk is free from knots, and it is plain sailing, he reads a virulent attack upon a rotten ministry, or an eloquent analysis of the Treaty of Peace. My friend's name is Greenow (Grinnoneau); that of the man on the next floor is Lusany (Lusaigne); that of the family at the back is Bonwell (Bonville). They are all, like a large proportion of these weavers, descendants of the French refugees who came over to England at the revocation of the Edict of Nantes. Their names, originally French, are clipped, and twisted, and mispronounced into an English form. My friend here can shew you his great-great-grandfather's Bible, with his name written in it by that worthy pere who accompanied his flock in their flight to the land of liberty. There is his name, Jean Francois Grinnoneau, the date of his expatriation, and the names of his descendants, in lineal order, down to the present representative. This man cannot speak a word of French, is considerably John Bullish in his constitution, and claims the right of a native to grumble and abuse the powers that be. These weavers are the aristocracy of the neighbourhood, and, on the whole, they are a set of thinking men. They patronise cheap literary institutions, listen to lectures with decent composure, and are partakers in the benefits of certain ha'penny news-rooms, where they can keep pace with the course of events in the *Sun* and *Globe*, and follow the mettlesome leaders in the *Times*.

Leaving this region of silk-weaving, let us approach a little nearer to the city. Here we find the houses still more crowded, the thoroughfares ill paved, and undrained courts, with a choice of smells that might almost rival the 'two-and-seventy stench' of Cologne. Here is a most unprepossessing *cul-de-sac*: at least, it looks like that; but if you go to the bottom, you will find a narrow archway that a casual observer might well overlook, which conducts into a court beyond. The people of the place are observing us; furtive glances are cast at us from behind window-curtains and doors ajar. Strangers do not often penetrate here; the scripture-reader and the city-missionary are the only visitors—except the policeman—who are not free of the fraternity.

Put your handkerchief in your breast-pocket, and button up your coat over your watch-chain; we are in the region of the pickpockets and thieves. I met with an adventure in this court some time since, which served to teach me its character. I was passing Whitechapel church one night, when I heard a light step in retreat behind me. I instinctively clapped my hand to my pocket—my handkerchief was gone. Turning round hastily, I caught sight of a boy running across the road, and thrusting something into his jacket as he ran. I gave chase. The urchin entered one of the by-streets at an easy pace; but finding himself pursued, soon struck off into the labyrinth of courts. Like an old hand, he doubled upon me, in and out, up one alley and down another. But I knew the ground well, and kept close up; and so away we went at a slashing rate, clattering over the rough flags, dashing into the slimy gutters; cheered on by the passengers whom we passed, and knocking down a placid policeman in our flight. At last, I ran him down in this very court. The boy began to whine and beg pardon in a

much louder tone than was necessary; and having recovered my breath, I was just opening an oration on dishonesty, when whack! came my hat over my eyes, and a kick from an unknown source sent me prostrate on the ground. While thus prone and darkened, I heard the sound of a closing door; and on regaining my balance, my game had disappeared with my baudana, and the coast was clear. The young heathen frustrated my good intentions, for I meant to have sent him to some school or reformatory, whence he might in due time have come forth in the dignity of scarlet uniform, and have cleaned boots at a penny a pair. But it is growing dusk; and as my looks are too jovial for a city-missionary, and yours are too honest for a member of the free brotherhood, we had better wend our way elsewhere.

Here is a locality almost entirely inhabited by costermongers, an honourable guild. Yonder is a collection of the barrows, trucks, and other *impedimenta* of those who have sold out, or who are not on duty. The word costermonger, in the strict sense of the term, signifies a dealer in fruit; but it is applied also to the dealers in oysters, vegetables, garden-roots, &c. It was the observation of the illustrious Samuel Weller, that 'poverty and oysters seem to go together,' and here you cannot but be struck with the truth of the remark. Fruit-stalls are numerous, but oyster-stalls are far more so. At whatever hour of the day you may pass, you will see the lovers of that succulent luxury gratifying their taste. Either as an appetising preparation for breakfast, or a savoury substitute for supper, oysters seem to be infallible. In the western high places of affluence and pleasure, they never meet your view; but here, where squalid poverty and misery are so rife, they seem almost indigenous to the soil. Armed with the rusty pepper-box and the weakened vinegar, and with oysters opening before them, the inhabitants defy fate. There are no less than 80,000 costermongers in the east end of London. In these days of military spectacles, I should like to witness a review of the costermongers: 80,000 Tatars and Amazons, with their 80,000 barrows, would be a sight worth seeing. The discipline might not be very perfect, and the evolutions might not be very imposing; but give them the Russian administration of raki—or a substitute—and start them with the war-cries of Billingsgate and Covent Garden, and they would rival the charge at Balaklava.

You can gather but a faint idea of the denseness of the population from merely observing the number of the houses; you must take into the account the separate families, varying from four to sixteen, which each dwelling contains. Now, here is a street consisting of about thirty houses, and each house is tenanted, on an average, by sixteen families. If you would like to see how human beings can herd together, come with me into this house. Here is a room with a woman and five children in it; a rabbit-hutch in one corner, and a dog with a litter of puppies under the bed. The atmosphere is stifling. Ask the woman to set the window open; she replies that she did so one day last week; but that she will not do it again, for the children have had bad colds ever since. In the next room, a newly married couple are added to the tenant-family, in the capacity of lodgers; and thus there are two families, nine souls, with the usual addenda of birds, cats, &c., living and sleeping in one small room. In one apartment at the top dwells a maker of lucifer-matches, salamandering in fire and brimstone. The cellar is occupied by a compounder of villainous *eau sucrée*, which he dignifies by the title of ginger-beer. But here there is an unmistakable odour of something stronger and 'shorter' than that: a steamy vapour comes up in thin streams through the cracks in the boards, laden with the pungent smell of gin. 'Come, good woman, no use disguising it, there's a still at work in the cellar.' I have known half-a-

dozen illicit stills in one parish—known to, and extensively patronised by the neighbours. The liquor is dispensed chiefly in ha'porths; and as customers get for their money about four times the quantity, and that of a far better quality than they would get at the 'palace' in the road, they are very ready to encourage private enterprise.

If you look at the map of London, you will observe that the district we have been traversing forms an irregular five-sided figure, bounded by the Hackney and Cambridge Roads, Bishopsgate Street, Houndsditch, and Whitechapel. As to area, this space is about one-thirtieth part of London; as to population, it is about one-eighth. Thus crowded together, epidemic diseases are always present with the inhabitants in some form or other. A fever acts here as a round-shot would de upon a close column of troops—a score are struck down, where only one would have fallen had the column been in open order. I saw this place in both the late visitations of cholera. Passing through a street during the first, I observed every house closed; I thought it a token of respect on occasion of the death or funeral of some person much esteemed; but, on inquiry, I found that every house had its own separate cause of mourning. During the height of the last attack, 600 interments a day was the average number for the seven or eight graveyards and cemeteries remaining unclosed in the neighbourhood. Many of these came from other parts, but still a frightful proportion from the district alluded to. Trooping on from early morning till late at night—hearse, and mute, and plume, in stately procession—coffins put through cab-windows, the relatives sitting face to face, with the corpse between them—or decently boxed under foot of the mourners in a patent vehicle, or humbly borne on men's shoulders to its last abode. For weeks together, during the daytime, I never looked from my window, I never stirred abroad in the street, without seeing one or more of these sad processions.

There is one redeeming feature amidst all this dirt, and smoke, and pestilential closeness—there is a park close by, with lakes, and pampered water-fowl, and trees of actual green, and its very grass enchanting to the half-stifed thousands who nightly flock to it for a breath of air. Were it not for this, the state of this part would be even more hideous than it is. This mitigates the evil; but how to remedy it is a question for the wise. When the value of health and life shall be reckoned above the value of property—when sanitary boards shall be more than a mere name—in that good time coming which requires such a telescopic faith to discern its approach; then may the east become habitable and healthy, and its people enjoy their due heritage of God's light and air.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER V.—MY CAPTIVE.

'Do not kill me, sir! I am a woman!'

This declaration scarcely astonished me; I was half prepared for it. During our wild gallop, I had noticed one or two circumstances which led me to suspect that the spy I pursued was a female. As the mustang sprang over the zequia, the flowing skirt of the manga was puffed upward, and hung for some moments spread out in the air. A velvet bodice beneath, a tunic-like skirt, the *tournure* of the form, all impressed me as singular for a cavallero, however rich and young. The limbs I could not see, as the goat-skin *armas-de-agua* were drawn over them; but I caught a glimpse of a gold spur, and the heel of a tiny red boot to which it was attached. The clubbed hair, too, loosened by the violent motion, sprang backward, and in two thick plaits, slightly dishevelled, rested upon

the croup of the horse. A young Indian's might have done so, but his tresses would have been jet-black and coarse-grained, whereas those under my eyes were soft, silky, and nut-brown. Neither the style of riding—a *la Duchesse de Berri*—nor the manlike costume of manga and hat, hindered me from forming my conclusions. Both the style and costume are common to the *rancheras* of Mexico. Moreover, as the mustang made his last double, I had caught a near view of the side face of his rider. The features of no man—not the Trojan shepherd, not Adonis nor Endymion—were so exquisitely chiseled as they. Certainly a woman! Her declaration at once put an end to my conjectures, but, as I have said, did not astonish me.

I was astonished, however, by its tone and manner. Instead of being uttered in accents of alarm, it was pronounced as coolly as if the whole thing had been a jest! Sadness, not supplication, was the prevailing tone, which was further confirmed as she knelt to the ground, pressed her lips to the muzzle of the still breathing mustang, and exclaimed:

'*Ay-de-mi! pobre yegua! muerta! muerta!*' (Alas me! poor mare! dead! dead!)

'A woman?' said I, feigning astonishment. My interrogatory was unheeded; she did not even look up.

'*Ay-de-mi! pobre yegua! Lola, Lolita!*' she repeated, as coolly as if the dead mustang was the only object of her thoughts, and I, the armed assassin, fifty miles from the spot!

'You say you are a woman?' I again asked—in my embarrassment scarcely knowing what to say.

'*Si, señor; nada mas—que quiere V.?*' (Yes, sir; nothing more—what do you want?) As she made this reply, she rose to her feet, and stood confronting me without the slightest semblance of fear. So unexpected was the answer, both in tone and sentiment, that for the life of me I could not help breaking into a laugh.

'You are merry, sir. You have made me sad; you have killed my favourite!'

I shall not easily forget the look that accompanied these words—sorrow, anger, contempt, defiance, were expressed in one and the same glance. My laughter was suddenly checked; I felt humiliated in that proud presence.

'Señorita,' I replied, 'I deeply regret the necessity I have been under: it might have been worse'—

'And how, pray?—how worse?' demanded she, interrupting me.

'My pistol might have been aimed at yourself, but for a suspicion'—

'*Carrambo!*' cried she, again interrupting me, 'it could not have been worse! I loved that creature dearly—dearly as I do my life—as I love my father—*pobre yegua—yeguita—ita—ita!*'

And as she thus wildly expressed herself, she bent down, passed her arms around the neck of the mustang, and once more pressed her lips to its velvet cheek. Then gently closing its eyelids, she rose to an erect attitude, and stood with folded arms, regarding the lifeless form with a sad and bitter expression of countenance.

I scarcely knew what to say. I was in a dilemma with my fair captive. I would have given a month of my 'pay-roll' to have restored the spotted mustang to life; but as that was out of the question, I bethought me of some means of making restitution to its owner. An offer of money would not be delicate. What then?

A thought occurred to me, that promised to relieve me from my embarrassment. The eagerness of the rich Mexicans to obtain our large American horses—*frisones*, as they term them—was well known throughout the army. Fabulous prices were often paid for them by these *ricos*, who wanted them for display upon the *Paseo*. We had many good half-bred bloods in the troop; one of these, thought I, might be acceptable, even to a lady who had lost her pet. I made the

offer as delicately as I could. It was rejected with scorn!

'What, señor!' cried she, striking the ground with her foot till the rowels rang—'what? A horse to me?—*Mira!*' she continued, pointing to the plain: 'look there, sir! There are a thousand horses; they are mine. Now, know the value of your offer. Do I stand in need of a horse?'

'But, señorita,' stammered I apologise, 'these are horses of native race. The one I propose to'—

'Bah!' she exclaimed, interrupting me, and pointing to the mustang: 'I would not have exchanged that native for all the *frisones* in your troop. Not one of them was its equal!'

A personal slight would not have called forth a contradiction; yet this defiance had that effect. She had touched the chord of my vanity—I might almost say, of my affection. With some pique I replied:

'One, señorita?'

I looked towards Moro as I spoke. Her eyes followed mine, and she stood for some moments gazing at him in silence. I watched the expression of her eye; I saw it kindle into admiration as it swept over the gracefully curving outlines of my noble steed. He looked at the moment superb; the short skurry had drawn the foam from his lips, and flakes of it clung against his neck and counter, contrasting finely with the shining black of his skin; his sides heaved and fell in regular undulations, and the smoke issued from his blood-red nostrils; his eye was still on fire, and his neck proudly arched, as though conscious of his late triumph, and the interest he was now exciting.

For a long while she stood gazing upon him, and though she spoke not a word, I saw that she recognised his fine points.

'You are right, caballero,' said she at length, thoughtfully, 'he is.'

Just then, a series of reflections were passing through my mind, that rendered me extremely uncomfortable; and I felt regret that I had so pointedly drawn her attention to the horse. Would she demand him? That was the thought that troubled me. I had not promised her any horse in my troop, and Moro I would not have given for her herd of a thousand; but on the strength of the offer I had made, what if she should fancy him? The circumstances were awkward for a refusal; indeed, under any circumstances refusal would have been painful. I began to feel that I could deny nothing. This proud, beautiful woman already divided my interest with Moro!

My position was a delicate one; fortunately, I was relieved from it by an incident that carried our thoughts into a new current: the troopers who had followed me at that moment rode up.

She seemed uneasy at their presence; that could not be wondered at, considering their wild garb and fierce looks. I ordered them back to their quarters. They stared for a moment at the fallen mustang with its rich blood-stained trappings, at its late rider, and her picturesque garments; and then, muttering a few words to one another, obeyed the order. I was once more alone with my captive.

CHAPTER VI.

ISOLINA DE VARGAS.

As soon as the men were out of hearing, she said interrogatively: '*Tejanos?*'

'Some of them are Texans—not all.'

'You are their chief?'

'I am.'

'Capitan, I presume?'

'That is my rank.'

'And now, Señor Capitan, am I your captive?'

The question took me by surprise, and, for the moment, I did not know what answer to make. The excitement

of the chase, the encounter, and its curious developments—perhaps, above all other things, the bewitching beauty of my captive—had driven out of my mind the whole purpose of the pursuit; and for some minutes I had not been thinking of any result. The interrogatory reminded me that I had a delicate duty to perform. Was this lady a spy?

Such a supposition was by no means improbable, as any old campaigner can testify. 'Fair ladies—though never one so fair as she—have, ere now, served their country in this fashion. She may be the bearer of some important dispatch for the enemy. If so, and I permit her to go free, the consequences may be serious—unpleasant even to myself.' Thus ran my reflections.

On the other hand, I disliked the duty of taking her back a prisoner. 'I feared to execute it; I dreaded her displeasure. I wished to be friends with her. I felt the influence of that mysterious power which transcends all strength—the power of beauty. I had been but ten minutes in the company of this brown-skinned maiden, and already she controlled my heart as though she had been its mistress for life!

I knew not how to reply. She saw that I hesitated, and again put the question:

'Am I your captive?'

'I fear, señorita, I am yours.'

I was prompted to this declaration, partly to escape from a direct answer, and partly giving way to the passion already fast gathering in my bosom. It was no coquetry on my part, no desire to make a pretty passage of words. Though I spoke only from impulse, I was serious; and with no little anxiety did I watch the effect of my speech.

Her large lustrous eyes rested upon me, at first with a puzzled expression; this gradually changed to one of more significance—one that pleased me better. She seemed for a moment to throw aside her indifference, and regarded me with more attention. I fancied, from the glance she gave, that she was contented with what I had said. For all that, the slight curl upon her pretty lip had a provoking air of triumph in it; and she resumed her proud *hauteur* as she replied:

'Come, caballero; this is idle compliment. Am I free to go?'

I wavered betwixt duty and over-politeness: a compromise offered itself.

'Lady,' said I, approaching her, and looking as seriously as I could into her beautiful eyes, 'if you give me your word that you are not a spy, you are free to go: your word—I ask nothing more.'

I prescribed these conditions rather in a tone of entreaty than command. I affected sternness, but my countenance must have mocked me.

My captive broke into unrestrained laughter, crying out at intervals:

'I a spy!—a spy! Ha, ha, ha! Señor Capitan, you are jesting?'

'I hope, señorita, you are in earnest. You are no spy, then?—you bear no dispatch for our enemy?'

'Nothing of the sort, mio capitan;' and she continued her light laughter.

'Why, then, did you try to make away from us?'

'Ah, caballero! are you not Tejanos? Do not be offended when I tell you that your people bear but an indifferent reputation among us Mexicans.'

'But your attempt to escape was, to say the least, rash and imprudent: you risked life by it.'

'Carramba, yes! I perceive I did;' and she looked significantly at the mustang, while a bitter smile played upon her lips. 'I perceive it now; I did not then. I did not think there was a horseman in all your troop could come up with me. *Merced!* there was one. You have overtaken me: you alone could have done it.'

As she uttered these words, her large brown eyes were once more turned upon me—not in a fixed gaze,

but wandering. She scanned me from the forage-cap on my crown to the spur upon my heel. I watched her eye with eager interest: I fancied that its scornful expression was giving way; I fancied there was a ray of tenderness in the glance. I would have given the world to have divined her thoughts at that moment.

Our eyes met, and parted in mutual embarrassment—at least I fancied so; for on turning again, I saw that her head drooped, and her gaze was directed downward, as if some new thought occupied her.

For some moments, both were silent. We might have remained longer thus, but it occurred to me that I was acting rudely. The lady was still my captive. I had not yet given her permission to depart: I hastened to tender it.

'Spy or no spy, señorita, I shall not detain you. I shall bear the risk: you are free to go.'

'*Gracias! caballero!* And now, since you have behaved so handsomely, I shall set your mind at rest about the risk. Read!'

She handed me a folded paper; at a glance, I recognised the *safe-guard* of the commander-in-chief, enjoining upon all to respect its bearer—the *Doña Isolina de Vargas*.

'You perceive, mio capitan, I was not your captive after all? ha! ha! ha!'

'Lady, you are too generous not to pardon the rudeness to which you have been subjected?'

'Freely, capitan—freely.'

'I shudder at thought of the risk you have run. Why did you act with such imprudence? Your sudden flight at sight of our picket caused suspicion, and of course it was our duty to follow and capture you. With the safe-guard, you had no cause for flight.'

'Ha! it was that very safe-guard that caused me to fly.'

'The safe-guard, señorita? Pray, explain!'

'Can I trust your prudence, capitan?'

'I promise—'

'Know, then, that I was not certain you were *Americanos*; for aught I could see, you might have been a guerilla of my countrymen. How would it be if this paper, and sundry others I carry, were to fall into the hands of Canales? You perceive, capitan, we fear our friends more than our enemies.'

I now fully comprehended the motive of her wild flight.

'You speak Spanish too well, mio capitan,' continued she. 'Had you cried "Halt!" in your native tongue, I should at once have pulled up, and perhaps saved my pet. Ah, me!—*pobre yegua!*'

As she uttered the last exclamation, her feelings once more overcame her; and sinking down upon her knees, she passed her arms around the neck of the mustang, now stiff and cold. Her face was buried in the long thick mane, and I could perceive the tears sparkling like dew-drops over the tossed hair.

'*Pobre Lola!*' she continued, 'I have good cause to grieve; I had reason to love you well. More than once you saved me from the fierce Lipan and the brutal Comanche. What am I to do now? I dread the Indian foray; I shall tremble at every sign of the savage. I dare no more venture upon the prairie; I dare not go abroad; I must tamely stay at home. *Mia querida!* you were my wings: they are clipped—I fly no more.'

All this was uttered in a tone of extreme bitterness; and I, I who so loved my brave steed, could appreciate her feelings. With the hope of imparting even a little consolation, I repeated my offer.

'Señorita,' I said, 'I have swift horses in my troop—some of noble race'—

'You have no horse in your troop I value.'

'You have not seen them all?'

'All—every one of them—to-day, as you filed out of the city.'

'Indeed?'

Indeed, yes, noble capitan. I saw you as you carried yourself so cavalierly at the head of your troop of *filibusteros*—ha, ha, ha!

'Señorita, I saw not you.'

'*Carrambo!* it was not for the want of using your eyes. There is not a *balcon* or *reja* into which you did not glance—not a smile in the whole street you did not seem anxious to reciprocate—ha, ha, ha! I fear, Señor Capitan, you are the Don Juan de Tenorio of the North.'

'Lady, it is not my character.'

'Nonsense! you are proud of it. I never saw man who was not. But come! a truce to badinage. About the horse—you have none in your troop I value, save one.'

I trembled as she spoke.

'It is *he*,' she continued, pointing to Moro.

I felt as if I should sink into the earth. My embarrassment prevented me for some time from replying. She noticed my hesitation, but remained silent, awaiting my answer.

'Señorita,' I stammered out at length, 'that steed is a great favourite—an old and tried friend. If you desire—to possess him, he is—he is at your service.'

In emphasizing the 'if,' I was appealing to her generosity. It was to no purpose.

'Thank you,' she replied coolly; 'he shall be well cared for. No doubt he will serve my purpose. *How is his mouth?*'

I was choking with vexation, and could not reply. I began to hate her.

'Let me try him,' continued she. 'Ah! you have a curb bit—that will do; but it is not equal to ours. I use a mameluke. Help me to that lazo.'

She pointed to a lazo of white horsehair, beautifully plaited, that was coiled upon the saddle of the mustang.

I unloosed the rope—mechanically I did—and in the same way adjusted it to the horn of my saddle. I noticed that the noose-ring was of silver! I shortened the leathers to the proper length.

'Now, capitan!' cried she, gathering the reins in her small gloved hand—'now I shall see how he performs.'

At the word, she bounded into the saddle, her small foot scarcely touching the stirrup. She had thrown off her manta, and her woman's form was now displayed in all its undulating outlines. The silken skirt draped down to her ankles, and underneath appeared the tiny red boot, the glancing spur, and the lace ruffle of her snow-white *calzoncillos*. A scarlet sash bound her waist, with its fringed ends drooping to the saddle; and the tight bodice, lashed with lace, displayed the full rounding of her bosom, as it rose and fell in quiet, regular breathing—for she seemed in no way excited or nervous. Her full round eye expressed only calmness and courage.

I stood transfixed with admiration. I thought of the Amazons: were they beautiful like her? With a troop of such warriors one might conquer a world!

A fierce-looking bull, moved by curiosity or otherwise, had separated from the herd, and was seen approaching the spot where we were. This was just what the fair rider wanted. At a touch of the spur, the horse sprang forward, and galloped directly for the bull. The latter, cowed at the sudden onset, turned and ran; but his swift pursuer soon came within lazo distance. The noose circled in the air, and, launched forward, was seen to settle around the horns of the animal. The horse was now wheeled round, and headed in an opposite direction. The rope tightened with a sudden pluck, and the bull was thrown with violence on the plain, where he lay stunned and apparently lifeless. Before he had time to recover himself, the rider turned her horse, trotted up to the prostrate animal, bent over in the saddle, unfastened the noose,

and, after coiling it upon her arm, came galloping back.

'Superb!—magnificent!' she exclaimed, leaping from the saddle and gazing at the steed. 'Beautiful!—most beautiful! Ah, Lola, poor Lola! I fear I shall soon forget thee!' The last words were addressed to the mustang. Then turning to me, she added: 'And this horse is mine?'

'Yes, lady, if you will it,' I replied somewhat cheerlessly, for I felt as if my best friend was about to be taken from me.

'But I do not will it,' said she with an air of determination; and then breaking into a laugh, she cried out: 'Ha! capitan, I know your thoughts. Think you I cannot appreciate the sacrifice you would make? Keep your favourite. Enough that one of us should suffer;' and she pointed to the mustang. 'Keep the brave black; you well know how to ride him. Were he mine, no mortal could influence me to part with him.'

'There is but one who could influence me.'

As I said this, I looked anxiously for the answer. It was not in words I expected it, but in the glance. Assuredly there was no frown; I even fancied I could detect a smile—a blending of triumph and satisfaction. It was short-lived, and my heart fell again under her light laugh.

'Ha-ha-ha! That one is of course your lady-love. Well, noble capitan, if you are true to her, as to your brave steed, she will have no cause to doubt your fealty. I must leave you. Adios!'

'Shall I not be permitted to accompany you to your home?'

'*Gracias!* no, señor. I am at home. *Mira!* my father's house!' She pointed to the hacienda. 'Here is one who will look to the remains of poor Lola;' and she signaled to a vaquero at that moment coming from the herd. 'Remember, capitan, you are an enemy; I must not accept your politeness; neither may I offer you hospitality. Ah! you know not us—you know not the tyrant Santa Anna. Perhaps even at this moment his spies are!'—She glanced suspiciously around as she spoke. 'O Heavens!' she exclaimed with a start, as her eyes fell upon the form of a man advancing down the hill. '*Santísima Virgen!* it is Ijurra!'

'Ijurra?'

'Only my cousin; but'—She hesitated, and then suddenly changing to an expression of entreaty, she continued: 'O leave me, señor! *Por amor Dios!* leave me! Adieu, adieu!'

Though I longed to have a nearer view of 'Ijurra,' the hurried earnestness of her manner overcame me; and without making other reply than a simple 'Adios,' I vaulted into my saddle, and rode off.

On reaching the border of the woods, curiosity—a stronger feeling perhaps—mastered my politeness; and, under the pretence of adjusting my stirrup, I turned in the saddle, and glanced back. Ijurra had arrived upon the ground. I beheld a tall dark man, dressed in the usual costume of the ricos of Mexico: dark cloth polka-jacket, blue military trousers, with scarlet sash around his waist, and low-crowned, broad-brimmed hat upon his head. He appeared about thirty years of age, whiskered, moustached, and, after a fashion, handsome. It was not his age, nor his personal appearance, nor yet his costume that had my attention at the moment. I watched only his actions. He stood confronting his cousin, or rather he stood over her, for she appeared to cower before him in an attitude of fear! He held a paper in one hand, and I saw he was pointing to it as he spoke. There was a fierce, vulture-like expression upon his face; and even in the distance I could tell, from the tones of his voice, that he was talking angrily. Why should she fear him? Why submit to such rude rebuke? He must have a strange

power over that spirit who could force it thus tamely to listen to reproach?

These were my reflections. My impulse was to drive the spurs into the sides of my horse, and gallop back upon the ground. I might have done so had the scene lasted much longer; but I saw the lady suddenly leave the spot, and walk rapidly in the direction of the hacienda.

I wheeled round again, and plunging under the shadows of the forest, soon fell into a road leading to the rancheria. My thoughts full of the incident that had just passed, I rode unconsciously, leaving my horse to his own guidance. My reverie was interrupted by the challenge of one of my own sentries, which admonished me that I had arrived at the entrance of the village.

CHAPTER VII.

AN ORDER TO FORAGE.

My adventure did not end with the day; it was continued into the night, and repeated in my dreams. I rode the chase over again; I dashed through the magueys, I leaped the *zequia*, and galloped through the affrighted herd; I beheld the spotted mustang stretched lifeless upon the plain, its rider bending and weeping over it. That face of rare beauty, that form of exquisite proportion, that eye rotund and noble, that tongue so free, and heart so bold—all were again encountered in dreamland. A dark face was in the vision, and at intervals crossed the picture like a cloud. It was the face of Ijurra.

I think it was that awoke me, but the *reveille* of the bugle was in my ears as I leaped from my couch.

For some moments I was under the impression that the adventure had been a dream: an object that hung on the opposite wall came under my eyes, and recalled the reality—it was my saddle, over the holsters of which lay a coil of white horsehair rope, with a silver ring at the end. I remembered the lazo.

When fairly awake, I reviewed my yesterday's adventure from first to last. I tried to think calmly upon it; I tried to get it out of my thoughts, and return seriously to my duties. A vain attempt! The more I reflected upon the incident, the more I became conscious of the powerful interest its heroine had excited within me. Interest, indeed! Say rather *passion*—a passion that in one single hour had grown as large as my heart!

It was not the *first* love of my life. I was nigh thirty years of age. I had been enamoured before—more than once, it may be—and I understood what the feeling was. I needed no Cupid to tell me I was in love again—to the very ends of my fingers.

To paint the object of my passion is a task I shall not attempt. Beauty like hers must be left to the imagination. Think of the woman you *yourself* love or have loved; fancy her in her fairest moments, in bower or boudoir—perchance a blushing bride—and you may form some idea—No, no, no! you could never have looked upon woman so lovely as Isolina de Vargas.

Oh! that I could fix that fleeting phantom of beauty—that I could paint that likeness for the world to admire! It cannot be. The most puissant pen is powerless, the brightest colour too cold. Though deeply graven upon the tablets of my heart, I cannot multiply the impression.

It is idle to talk of wavy hair, profuse and glossed—of almond eyes with long dark fringes—of pearl-white teeth, and cheeks tinted with damascene. All these had she, but they are not peculiar characteristics. Other women are thus gifted. The traits of *her* beauty lay in the intellectual as much as the physical—in a happy combination of both. The soul, the spirit, had its share in producing this incomparable picture. It was to behold the play of those noble features, to

watch the changing cheek, the varying smile, the falling lash, the flashing eye, the glance now tender, now sublime—it was to look on all this, to be impressed with an idea of the divinest loveliness.

As I ate my frugal breakfast, such a vision was passing before me. I contemplated the future with pleasant hopes, but not without feelings of uneasiness. I had not forgotten the abrupt parting—no invitation to renew the acquaintance, no hope, no prospect that I should ever behold that beautiful woman again, unless blind chance should prove my friend.

I am not a fatalist, and I therefore resolved not to rely upon mere destiny, but, if possible, to help it a little in its evolution.

Before I had finished my coffee, a dozen schemes had passed through my mind, all tending towards one object—the renewal of my acquaintance with Isolina de Vargas. Unless favoured by some lucky accident, or, what was more desirable, *by the lady herself*, I knew we might never meet again. In such times, it was not likely she would be much 'out of doors;' and in a few days, hours perhaps, I might be ordered *en route* never more to return to that interesting outpost. As the district was, of course, under martial law, and I was *de facto* dictator, you will imagine that I might easily procure the right of entry anywhere. Not so. Whatever be the licence of the rude soldier as regards the common people of a conquered country, the position of the officer with its higher class is essentially different. If a gentleman, he naturally feels a delicacy in making any advances towards an acquaintance; and his honour restrains him from the freer forms of introduction. To take advantage of his position of power would be a positive meanness, of which a true gentleman cannot be guilty. Besides, there may be rancour on the part of the conquered—there usually is; but even when no such feeling exists, another barrier stands in the way of free association between the officer and 'society.' The latter feels that the position of affairs will not be permanent; the enemy will in time evacuate, and then the vengeance of mob-patriotism is to be dreaded. Never did the ricos of Mexico feel more secure than while under the protection of the American army. Many of them were disposed to be friendly, but the phantom of the future, with its mob *emeutes*, stared them in the face, and under this dread they were forced to adopt a hypocritical exclusiveness. Epaulettes must not be seen glancing through the windows of their drawing-rooms!

Under such circumstances, my situation was difficult enough. I might gaze upon the outside walls of that handsome hacienda till my heart ached, but how was I to effect an entrance?

To charge a fort, a battery, an intrenched camp—to storm a castle, or break a solid square—one or all would have been child's play compared with the difficulty of crossing that glacial line of etiquette that separated me from my beautiful enemy.

To effect this purpose, a dozen schemes were passed through my mind, and rejected, till my eyes at length rested upon the most interesting object in the apartment—the little white rope that hung upon my saddle-bow. In the lazo, I recognised my 'forlorn-hope.' That pretty implement must be returned to its owner. *I myself should take it home!* So far *destiny* should be guided by me; beyond, I should have to put my trust in destiny.

I think best under the influence of a cigar; and lighting one, I ascended to the azotea, to complete my little scheme.

I had scarcely made two turns of the roof, when a horseman galloped into the piazza. He was in dragoon uniform, and I saw he was an orderly from headquarters, and inquiring for the commander of the outpost. One of the men pointed to me; and the

orderly trotting forward, drew up in front of the alcalde's house, and announced to me that he was the bearer of a dispatch from the general-in-chief, at the same time shewing a folded paper. I directed him to pass it up on the point of his sabre, which he did; and then saluting me, he turned his horse and galloped back as he had come.

I opened the dispatch, and read:

'HEAD-QUARTERS, ARMY OF OCCUPATION.
July —th, 1846.

SIR—You will take a sufficient number of your men, and proceed to the hacienda of Don Ramon de Vargas, in the neighbourhood of your station. You will there find 5000 head of beeves, which you will cause to be driven to the camp of the American army, and delivered to the commissary-general. You will find the necessary drivers upon the ground, and a portion of your troop will form the escort. The enclosed note will enable you to understand the nature of your duty.

CAPTAIN WARFIELD.

A. A. Adjutant-general.

'Surely,' thought I, as I finished reading—'surely there is a "Providence that shapes our ends." Just as I was cudgelling my brains for some scheme of introduction to Don Ramon de Vargas, here comes one ready fashioned to my hand.'

I thought no more about the lazo: the rope was no longer an object of prime interest. Trimmed and embellished with the graceful excuse of 'duty,' I should now ride boldly up to the hacienda, and enter its gates with the confident air of a welcome guest. Welcome indeed! A contract for 5000 beeves, and at war-prices! A good stroke of business on the part of the old Don. Of course, I shall see him—'embrace him'—hobnob with him over a glass of Canario or Xeres—get upon the most intimate terms, and so be 'asked back.' I am usually popular with old gentlemen, and I trusted to my bright star to place me *en rapport* with Don Ramon de Vargas. The coralling of the cattle would occupy some time—a brace of hours at the least. That would be outside work, and I could intrust it to my lieutenant or a sergeant. For myself, I was determined to stay by the walls. The Don must go out to look after his vaqueros. It would be rude to leave me alone. He would introduce me to his daughter—he could not do less: a customer on so large a scale! We should be left to ourselves, and then—Ha! Ijura! I had forgotten him. Would he be there?

The recollection of this man fell like a shadow over the bright fancies I had conjured up.

A dispatch from head-quarters calls for prompt attention, and my reflections were cut short by the necessity of carrying the order into execution. Without loss of time, I issued orders for about fifty of the rangers to 'boot and saddle.'

I was about to give more than ordinary attention to my toilet, when it occurred to me I might as well first read the 'note' referred to in the dispatch. I opened the paper; to my surprise, the document was in Spanish. This did not puzzle me, and I read:

'The 5000 beeves are ready for you, according to the contract, but I cannot take upon me to deliver them. They must be taken from me with a *show of force*; and even a little rudeness on the part of those you send would not be out of place. My vaqueros are at your service, but I must not command them. You may press them.

RAMON DE VARGAS.'

This note was addressed to the commissary-general of the American army. Its meaning, though to the uninitiated a little obscure, was to me as clear as noon-day; and although it gave me a high opinion of the administrative talents of Don Ramon de Vargas, it

null every act of the fine programme I had sketched out. By its directions, there was to be no 'embracing,' no hobnobbing over wine, no friendly chat with the Don, no *tête-à-tête* with his beautiful daughter—no; but, on the contrary, I was to ride up with a swagger, bang the doors, threaten the trembling porter, kick the peons, and demand from their master 5000 head of beef-cattle—all in true freebooting style!

A nice figure I shall cut, thought I, in the eyes of Isolina; but a little reflection convinced me that that intelligent creature would be in the secret. Yes, she will understand my motives. I can act with as much mildness as circumstances will permit. My Texan lieutenant will do the kicking of the peons, and that without much pressing. If she be not cloistered, I will have a glimpse at her; so here goes. 'To horse!'

The bugle gave the signal; fifty rangers—with Lieutenants Holingsworth and Wheatley—leaped into their saddles, and next moment were fling by twos from the piazza, myself at their head.

A twenty minutes' trot brought us to the front gate of the hacienda, where we halted. The great door, massive and jail-like, was closed, locked, and barred; the shutters of the windows as well. Not a soul was to be seen outside, not even the apparition of a frightened peon. I had given my Texan lieutenant his cue; he knew enough of Spanish for the purpose.

Flinging himself out of the saddle, he approached the gate, and commenced hammering upon it with the butt of his pistol.

'*Ambre la puerta!*' (Open the door!) cried he.

No answer.

'*La puerta—la puerta!*' he repeated in a louder tone.

Still no answer.

'*Ambre la puerta!*' once more vociferated the lieutenant, at the same time thundering on the woodwork with his weapon.

When the noise ceased, a faint '*Quien es?*' (Who is it?) was heard from within.

'*Yo!*' bawled Wheatley, '*ambre! ambre!*'

'*Si, señor,*' answered the voice, in a somewhat tremulous key.

'*Anda! anda! Somos hombres de bien.*' (Quick then! We are honest men.)

A rattling of chains and shooting of bolts now commenced, and lasted for at least a couple of minutes, at the end of which time the great folding-doors opened inward, displaying to view the swarthy leather-clad *portero*, the brick-paved *saguan*, and a portion of the *patio*, or courtyard within.

As soon as the door was fairly open, Wheatley made a rush at the trembling porter, caught him by the jerkin, boxed both his ears, and then commanded him, in a loud voice, to summon the *dueño*! This conduct, somewhat unexpected on the part of the rangers, seemed to be just to their taste; and I could hear behind me the whole troop chuckling in half-suppressed laughter. *Guerilleros* as they were, they had never been allowed much licence in their dealings with the inhabitants—the non-combatants—of the country, and much less had they witnessed such conduct on the part of their officers. Indeed, it was cause of complaint in the ranks of the American army, and with many officers too, that even hostile Mexicans were treated with a lenient consideration denied to themselves. Wheatley's behaviour, therefore, touched a chord in the hearts of our following, that vibrated pleasantly enough; they began to believe that the campaign was about to become a little more jolly.

'*Señor,*' stammered the porter, 'the du—du—dueño has given or—orders—he wi—wi—will not s—see any one.'

'*Will not!*' echoed Wheatley; 'go, tell him he must!'

'*Yes, amigo,*' I said soothingly; for I began to fear

message. 'Go, say to your master that an American officer has business with him, and must see him immediately.'

The man went off, after a little more persuasion from the free hand of Wheatley, of course leaving the gates open behind him.

We did not wait for his return. The patio looked inviting; and directing Holingsworth to remain outside with the men, and the Texan lieutenant to follow me, I headed my horse for the great archway, and rode in.

CONSOLIDATION OF THE STATUTE LAWS OF ENGLAND.

THE consolidation of the statute laws of England has been often attempted, but hitherto the scheme has always failed. Various causes led to this result: the members of the old commission spent their time in quarrelling; they tried to write each other down, and published all sorts of accusations and recriminations against each other; and until last session, every one thought the question was disposed of for many years.

Last session, however, the commission was reformed, and Sir Fitzroy Kelly, although an opponent of the present government, consented to waive political feeling, and undertook, unpaid and unrewarded, the laborious duty of heading it. For the time, toil and personal labour he will have to give to this duty, it may be doubted whether £7000 per annum would recompense him. Sir Fitzroy Kelly, however, has absolute authority to do the work in his own way, employing gentlemen at the bar of competent skill and experience to assist, and paying them for such assistance at his own discretion. It is also understood that the work, when done, is to be accepted as it is, and parliament is to be asked to take the consolidation bills in their integrity, and, in reliance upon the commission, to pass them without debate upon their provisions, in faith that they are not a new law, but merely the existing law, collected and arranged in an orderly manner.

In answer to the inquiries of the great law-reformer, Lord Brougham, as to 'the state and prospects of the consolidation of the statute law,' Sir Fitzroy Kelly, after mentioning his appointment, thus states the mode in which the work is to be done: 'To consolidate the statute law, is to take the statutes at large from Magna Charta to the last act of Victoria; to expunge and reject from the statute-book every act and every enactment which is either repealed, expired, or obsolete, and then to take what remains—which will consist of all that is law in force and to continue in force—to digest and to arrange this body of law by dividing it into classes, and subdividing each class into single subjects, and then to reduce the whole into single bills, each bill being on a single subject, but comprising the whole of that subject. The amendment of the statute-book is neither more nor less than the applying, by a series of new acts of parliament, a complete remedy to every grievance, every defect, and every evil which now exists in the statute law.'

The work was commenced in May last. Barristers were employed to go through the statutes at large, from Magna Charta to the 20th of Victoria; in short, to go through the entire statute-book, and having laid aside all the repealed and otherwise inoperative matter, to retain every act and enactment which is now in force, and intended to remain in force, and to digest and arrange this statute law in classes, and then subdivide each class into single bills upon single subjects; and, finally, to prepare, revise, and perfect the whole of these bills in one uniform style of phraseology, and upon one system of arrangement. Three classes were selected for a beginning: criminal law, real property law, and mercantile law. The criminal law was divided into eight bills. Barristers

were employed to prepare these eight bills, detailed instructions for their guidance being previously laid before them. As a draft of each bill was ready, it was first inspected and revised by Sir Fitzroy Kelly and Mr Greaves, a member of the commission; and all difficulties that presented themselves were noted down for ulterior consideration, and the bills were then gone through and finally corrected by Sir Fitzroy Kelly, Lord Wensleydale, Lord Chief-justice Jervis, and Mr Greaves, assisted by Mr Brickdale, the secretary to the commission. This class, containing the whole of the criminal statute law, thus perfected, was submitted by the Lord Chancellor to the House of Lords at the close of last session. The other two classes, real property law and mercantile law, and several single bills constituting classes by themselves, are now in preparation upon the same principle, and will undergo the same process of revision, and will probably be ready to be laid before parliament on the first day of the ensuing session. Simultaneously with the consolidation of the public general statutes, is proceeding that of the local, personal, and private acts. If government and the two houses of parliament give the support and co-operation which are necessary, it is supposed the entire work will be completed in three years from the commencement.

The difficulties attending this herculean task are well described by Sir Fitzroy Kelly; he says: 'It is almost impossible to exaggerate the difficulties which attend the undertaking. The question continually arises—whether the enactments of several reigns, as of William III., or of the Georges, are virtually or impliedly repealed or varied by other enactments upon the same subject, and with the same intent in later acts, as of William IV. and Victoria? So, likewise, provisions were found of the highest constitutional importance in statutes of Anne and William III., for supplying copies of the indictments and lists of witnesses to persons indicted for high treason. (It was upon one of these that the point arose in Frost's case by which his life was saved, and the fifteen judges divided against each other—eight to seven, and nine to six.) Then other provisions with the same intent, and nearly same effect, but varying from those of William III. and Anne when read together, were found in acts of George III. and IV., William IV., and Victoria.' These could not be repeated verbatim without contradiction; the strict legal construction of these complicated acts had therefore to be decided upon. This was done by Lord Wensleydale, Lord Chief-justice Jervis, Sir Fitzroy Kelly, and Mr Greaves; but not without many days, says Sir Fitzroy Kelly, of anxious and careful research and deliberation. Other serious difficulties arose from the vicious practice of repealing acts or enactments by provision that 'so much of any former act of parliament heretofore made as is inconsistent with, or repugnant to, the act in question, shall be, and is thereby repealed.' This evil makes it necessary to go through the whole of the earlier acts operated upon by the later act, and to determine how much is repealed and how much is not; and other difficulties of equal magnitude have already arisen, and must be anticipated throughout the entire work.

The evils resulting from the present state of the statute-book are manifold; any one purchasing the statutes at large must pay the price of, and encumber his shelves with forty volumes, of which above thirty-five are filled with inoperative and worthless matter! These forty volumes contain above a million of enactments, without order or connection. Enactments upon totally different subjects and branches of the law are thrown together. Any one wishing to ascertain the law upon a given subject, must go through the whole confused mass of matter, and extract, as best he can, what is law. And, from this confusion, the

acts themselves cannot be relied on in all cases as accurate. Thus, an act of Victoria cites in several places the 6th George IV., ch. 43, as the 5th George IV., ch. 43, which is an act upon a totally different subject; and misquotations, not only of the title, but of the language of former acts, are not wanting.

The present scheme of consolidation, involving as it does no alteration in the laws, is a grand one, and so far proves to be a successful one. But to insure complete success, it must have the full confidence of parliament. There must be no reviewal by the legislature; it must be taken or rejected in its entirety; for if each bill is to be debated in all its details in committee of both Houses, a century would not suffice for the work.

The result of consolidation will be, that all the evils detailed will be remedied: 40,000 statutes—of which 16,000 are upon public general law—will be reduced to between 300 and 400. Forty volumes of statutes will be reduced to five or six volumes, indispensable to statesmen, lawyers, magistrates, and public officers.

The doubts as to what is, and what is not repealed, will be cleared up. The difficulties, and consequently the great amount of litigation to which the present uncertainty gives rise, are beyond calculation. It has been thought that more than half the business of all the courts of law and equity in the kingdom consists of disputed questions upon the construction of acts of parliament. Again, so long as the statute-book remains in its existing state, it will be impossible to adopt a pure principle of legislation. Mr Brickdale well observes upon this subject: 'A member of either House about to bring in a bill, finds that a class is suffering injustice or inconvenience, in consequence of the state of the law, which it is his duty to remedy; but he has not before him, in any simple or accessible form, either the whole law, or the subject, or any statement of the principle of the law, which is the cause of the evil complained of: he therefore naturally contents himself with introducing a bill which remedies that specific evil, and no more: he even carefully avoids any appearance of interfering with principles, for fear of effecting something which he did not intend, or unintentionally opening questions which would lead to opposition, and perhaps frustrate his whole immediate object—the removal of the evil actually felt.'

LITERATURE AND LITERARY MEN.

What is literature? Is a playbill literature, even when it contains laborious antiquarianism, deep geographical inquiries as to the outline of Bithynia and disquisitions on the Pyrrhic dance, or the length of petticoat of the Virgins of the Sun? Is a sermon published 'by request' of a decent congregation—which fell asleep before it could hear the end of it—literature? Is an indignant letter (paid for as an advertisement), wherein Brutus Junior threatens a village church-warden for refusing him a sitting in church, literature? Are the letters, marked respectively 1, 2, 3, and 4, up to the round dozen, in the hostile correspondence between Swifins, stock-broker, Fulham, and Snodge, drysalter, Muswell Hill, literature? Why did they quarrel about that Newfoundland dog, which came out all dripping from the Serpentine, and shook itself in the most snobbish manner over the apparel of a young lady, 'whose name it is needless to introduce in this very unpleasant affair' (but which we know to be Sophia Groby—old Groby's daughter, Fleet Street); and after a week's angry interchange of epistolary amenities, with fiery allusions to pistols for two (and no coffee), end by discovering that the sagacious Ponto meant no personal disrespect either to Swifins or the interesting young lady whose name, &c., and that even if he had, he was not the property, and therefore not under the control, of Snodge, of Muswell Hill. Is this literature? I suppose it is; for judging from my own experience, most writings of the present day are literature, and most of the people you meet are literary men.—*Blackwood's Magazine*.

A DREAM.

I HAD a vision! O'er my life
It shed so bright a gleam,
So very sweet, so very soft,
Alas! how could I deem
To see it reft, while I am left
To know it was a dream.

'Twas like some bright bird fluttering
Through that dark grove, my heart,
Bearing the sunshine of its wing
Even to the gloomiest part;
Now cold and dead, its sweet life fled,
Leaving this heavy smart.

Like a calm star to my spirit's depth
That gentle vision shone;
'Tis faded, but a strange pale flame
Still burneth fiercely on,
Raising its light in wild despite,
The ghost of what is gone.

Or I bear my dream like a dear friend dead,
To a home in my secret soul;
I must be alone, oh, quite alone,
Ere I weep without control:
I could not hear the harsh ones jeer,
Still less the kind condole.

In a very dark and silent room
It lieth concealed from all,
And I have covered its cold, stiff form
With a heavy funeral pall;
Yet I tremble and shrink as I sometimes think,
What, if the shroud should fall?

When the solemn hand has guided me
To the land I have in view,
And shewed me those I've sought in vain,
The loving and the true,
All grief that day shall have fled for aye,
Like the early morning-dew.

When I walk with a kindred soul at last
Beside heaven's crystal streams,
When truth shines down with unclouded light,
Instead of these fitful gleams,
Where the weary breast finds a lasting rest,
God grant there are no more dreams!

M. L. P.

NEW PROCESS OF VINIFICATION.

It has been discovered by analysis that the grape-substances giving out *colour, taste, bouquet, and flavour* to wine—namely, tartar, tannin, essential oil, and colouring matter—constitute only *one per cent.* of its composition, the remaining 99 per cent. consisting merely of sugar and water. It is this *one per cent.* alone which makes wine, distinguishes it from all other liquids, and bestows its different valuable qualities. It appears that the above-mentioned component parts, especially that which is most precious, the *essential oil*, are only one-fourth absorbed by the usual process of fermentation. There is therefore left undeveloped at the bottom of the fermenting tuns or vats 75 per cent. of flavour, &c., which, if saturated in a solution of refined sugar and water, will give out one-third of its unexhausted properties, which is sufficient to produce wine of a better quality than that derived from the natural must. This operation may be three times repeated with the same result; and even if tried a fourth time, will yield sufficient flavour to make a small description of vinous liquid. This discovery is due to the French chemists, who, on account of defective vintages, have deemed it worthy to investigate the subject.—*Ridley & Co.'s Monthly Circular*.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 159.

SATURDAY, JANUARY 17, 1857.

PRICE 1½d.

AN EXCEEDINGLY CHEAP TOUR.

ALTHOUGH I am tolerably well off for a curate, in having nothing to pay for vegetables and house-rent, money—as far as it can be said of any churchman—is a considerable object to me. I have to save in this matter, and to go without in that, and to accustom my stomach a good deal to home-made wine. My surplice—the idea of a curate having such a thing!—is not of lawn, nor do I renew very often that miraculous silk garment without fastening, the getting into which is one of the mysteries of the Church of England. I read the wicked *Times*, on its third day, without feeling any of those disagreeable qualms with which it affects my revered rector, ‘the cloth’ it attacks being of a material very widely different from mine. I confess, however, that my own clerical character falls considerably short of the ideal standard set up by the conductors of that journal. I think it no sin in a bachelor curate, whose hard lines have fallen in a place five miles from the nearest educated being, feeling a little dull, being desirous of a visit from his friend from time to time, or taking his parson’s holiday, of twenty days, once every summer. I take one myself yearly, with as much mental profit as pleasure, and return to my parish all the better fitted in health and spirit to renew my labours in that vineyard. In the front of this last June, I walked over the English and Scotch lake countries with Tom Trevor, attorney-at-law of Striketown. We were at dear old Trinity together in the old times, and understand one another perfectly. ‘We have heard the chimes at midnight, have we not?’ quotes he. ‘Oh, the mad days we have spent, and to see how many of mine old acquaintance that are now clergymen!’ I have no antecedents, I am thankful to say, to be very deeply ashamed of; and if I had, I should know that Tom could mean nothing but good-humour and pleasantry in reminding me of them. He is one of those rare ones who can say without offence anything, that from another man would be absolutely intolerable. That perpetual pyrotechnic display of his, no matter how inflammable the material on which it descends, never seems to set any one on fire. I don’t know where he keeps his law-books, his business airs, his ill successes, his Christmas bills, and his indigestions, but none of his friends have ever seen a symptom of them: this of course weakens the vulgar belief in his solid virtues; and we who are pillars shake our heads a little, though we cannot refuse to offer cordial hands; while his defence is, that his principles, so far from not being high enough, are elevated clean out of sight.

He gives his brothers of his best;

His worst he keeps, his best he gives,

and I for one am not inclined to be hard upon him. He is, of course, one of the most charming ‘tourist’s companions’ possible, and full of the happiest illustrations, lending an interest to the dullest landscapes, and heightening the glory of the grandest—‘unto sorrow giving smiles, and unto graces, graces.’ I remember him, while at college, discovering a pathos in a certain proposition in statics—whose object and meaning I have entirely forgotten, and which I shall most probably misquote—and throwing a touching regretfulness into his tones as he described how DE vanisheth, the weight is supported by the immovable fulcrum C, and the body is at rest! It is said to have drawn tears from an entire lecture-room.

‘Now, Trevor,’ said I, before we started upon our rambles, ‘you have a genius for finance, I know, so you shall carry the bag for both of us; but remember I am but a poor curate, so don’t be over-generous.’

‘Reverend sir!’ answered he, ‘I am a lawyer, and such imputations I shake from off me as dew-drops are shaken from the calf-skin. Leave everything pecuniary to me.’

After this arrangement, I, of course, never interfered in such matters, nor was I ever present at any settling transactions whatsoever; and hence it was, as will be seen, that I came to make such an exceedingly cheap tour.

The landscape which lies round my curacy has none of these straggling objects about it, obstructing the light and air, which are called trees; but their place is supplied in some measure by gigantic chimneys, from the mouths of which rises an artificial sky, so dense that one wonders it doesn’t rain down ink. And yet we have a sense of coming summer, even there—a rustle of the leafy woodlands, a murmur of the pleasant brooks, make themselves heard amidst our very furnace roars; we feel that somewhere is the sun unblurred, the snow-white cloud set in, the stainless blue; the green earth without touch of cinder-scar. We that have heard it, long then to hear the wind at its wild play among the hill-tops, as hungry men for food. The great town, whose iron clamour comes to us for ever across the level flats, in summer scarcely seems fit to breathe and move in. There are no fountains there, no parks, no gardens, no galleries of pictures, where a man may slake his thirst for freshness and for freedom; the workman there knows not so much of nature even as art, her pretty waiting-maid, can tell him: that is what dulls our pleasure—Tom’s and mine—as we start from the hot clanging Striketown station for the purple hills. ‘The pastor sees the dewy meadows, and the water-springs, but the flock never sees,’ sighed I. ‘Yes,’ echoed Trevor; ‘you the pastor, I the shearer,

we alone.' A Striketown magnate in the same carriage—he was a corrugated iron-merchant, and he looked like it—took umbrage at our remarks upon this subject; but myself engaging him steadily hand to hand, while Tom dazzled him with his finest sheet-lightning, we reduced him to silence: presently, however, while we two were speaking of the best poetical expressions for distance, and one was instancing poor Keats's

There she stood,

About a young bird's flutter from the wood,

he broke in again with: 'And, gentlemen, pray how many yards may that be?' and so revenged himself.

Stafford, Preston, Lancaster, the abominable Crewe, were all left behind in due course, and we quitted the London and North-western for Westmoreland and fairyland at last. I confess myself to have been born a Cockney, and to entertain an admiration, not unmingled with awe, for the Surrey range. The great mountain mesh-work of the lake-country is to my eyes, therefore, quite as tremendous as the Himalayas; and all the witty things that have been said against it and the lakes pass by me like the idle wind, that wakes a smile of pity upon the face of fair Windermere, but never stirs its depths. I know not how far the dim recollection of a wearisome journey, and the distinct remembrance of a most excellent dinner, may have contributed to bring it about, but as we lay in our boat beneath Belle Isle that evening, the careless splash of the oars alone breaking the silence which brooded over the serene hills and moonlit lake, I believe, with Trevor, that if you had put pen and ink within my grasp—and it were not for the rhymes—I could have gone nigh to have written a sonnet. I feel at this moment the fatal facility of the lake district for writing descriptions stealing over me at the mere reminiscence; I long to honey my page with such names as Ambleside and Elterwater, or to make it like a leaf out of some mountain peerage, with such titles as Helvellyn and Glaramara, but I forbear. Enough to say, that we made forced marches over the hills and far away to our great content; the knapsacks—which at first seemed to be endowed with life and a desire to go the other way—which lay between our astonished shoulders like two large live coals, and which rendered our conditions of equilibrium both novel and dangerous—at last becoming as natural to us as the hump to the camel. And ever, at the close of each day's toil, did the red wine flow from the hotel's best bin; nor at any time, when our four legs grew weary, did we hesitate to hire eight fresh ones to relieve them, till, for my part, I began to fear that we should scarcely reach the Land of Cakes at all, or if we did, that we should have no money left to buy any. That Tom did pay for things, and pay liberally, was evident enough, for I never saw landlords more obsequious, landladies more gracious, or the plurality of boots more perfectly satisfied. One day, when we were carrying it, the driver, who was new to the lake-country, and desired to make a cicerone of himself for the benefit of future visitors, entreated us to point out to him the local habitations and the names of the great celebrities, which Trevor did at once, most cheerfully and with a vengeance. It seemed to our astonished Jehu that so many eminent persons were never before collected in so small a compass; in particular, a certain sequestered clergyman, preferring the delights of solitude among the

hills to that of his collegiate halls during the long vacation, had an undreamt-of greatness thrust upon him. Many a time has he since been startled by a string of cars, filled with excursionists, pulling short up before his cottage door, while our apt friend, whip in hand, dilates aloud upon the glory of 'Mr A——, the Fellow of St Boniface, the accomplished coach, who knows more about the particle μ than any other man within the four seas: that's his bedroom, gentlemen and ladies, looking east.' Whose fame is much indebted to Tom Trevor. On account of this good turn being done him, the driver declined to take more than a shilling for chariotteering us twelve miles; but of course Tom couldn't get rid of all our carmen for such a mere song as that; and how the purse held out, grew a still greater wonder to me, day by day.

In Caledonia, matters went on just as smoothly: we denied ourselves no dainty which loch or mountain afforded, while the wine of the country, by reason of its smoky character, was pronounced not good enough for our palates, and rejected for burgundy and claret. Still, while I was set wondering whether or not a clergyman of the Church of England could be imprisoned in a Tolbooth for a hotel bill, the adulation of us in no way decreased. Gillies ran bare-legged, as though with the fiery cross in hand, to do our behests; musicians, with instruments resembling the interiors of quadrupeds, performed the most excruciating coronachs at our departures, and what were meant for triumphant airs at our arrivals. The best bedrooms seemed to have been bespoken for us at every inn, and the seats that were most comfortable, or which commanded the most extensive views, to have been reserved for us in the coffee-rooms. I began to have a horrid suspicion that we were being taken for somebody else—ambassadors extraordinary, or the Brothers Rothschild in disguise. Trevor had some sketching-paper, and I a note-book, which I used pretty freely; but neither authors nor artists—I can answer for Striketown, at least—were wont to be held in such consideration in the south, as to induce a belief that our genius and talents were only receiving their natural tributes. Sometimes Tom wrote the day before to secure accommodation for us, and sometimes had an interview with the landlord as soon as we arrived; but in either case, our occupation of the premises seemed to be hailed as triumphant and honourable to an extreme degree. At one of the largest inns in the Western Highlands, I happened, in Trevor's absence, to receive the bill instead of him, and I remember thinking of sending it to the *Times* newspaper, to refute the calumnies that had been published about hotel charges, only Tom persuaded me not. This is the bill, which, for two persons, I surely was justified in thinking very moderate: Double-bedded room, 1s. 6d.; soup and fish-dinner (for two), 3s.; bottle of port (1834), 3s.; breakfast for two, with meat, 1s. 6d.: Total, 9s. *N.B.*—It is particularly requested that no gratuities may be given to the servants.

I was much astonished that none of our fellow-travellers by the coach that morning seemed to be satisfied with their bills, but accused the landlord most unmercifully of extortion and excess; and I agreed with Tom that it was a very remarkable exemplification of the proverbial nearness of the Scotch character.

We travelled so fast, that I had time enough to spare

for a four days' run into Ireland, which I was over-persuaded to take by my companion.

The sister-isle received us with extended arms: if anything, the welcomes of the innkeepers appeared to be still warmer and more affectionate than elsewhere, and the settlement of their accounts a mere form, that we were at liberty to go through or not as we preferred. The landladies went so far, on more than one occasion, as to kiss Trevor, and to entitle me their jewel; the gossoms stood on their heads to do us honour; and the very beggars about the inn-yards regarded us with a solicitude that was the more remarkable by reason of the difference of our countries and religions.

Upon the nineteenth day, I returned like a punctual shepherd to my flock, and on our road, Tom Trevor, Esq., attorney-at-law, insisted upon my auditing the accounts of our expenses, which—particularly as he handed me a much larger balance than, under the circumstances, I should have thought possible—I was very unwilling to do. My share of the three weeks' tour, irrespective of coach, railway, and packet fares, was under a five-pound note.

'Well, my dear fellow,' said I, with that feeling of grateful admiration which a Briton rarely permits himself to entertain except towards a great financier, 'all I can say is, I can't imagine how you did it. I never lived better or at less cost in all my life, and I shall certainly go over the same ground next summer, and, as I most sincerely hope, with the same companion.'

There was a curious expression about Trevor's eye which made me unaccountably uneasy, as he replied with some dryness: 'Well, I think your reverence had better not do that for a few seasons.'

'Why? why not, Trevor?—for goodness' sake, tell me why not?' said I, getting alarmed.

'Oh, nothing; don't be afraid, my dear sir; trust me for keeping on the safe side of the law in these matters.'

'The law!' gasped I, looking at the figures just transferred to my note-book, and regretting, somehow, that they did not make up a larger sum; 'why, you don't mean to say you'—

'No, I did nothing,' interrupted Tom; 'it was all you, you and that note-book. The fact is, you made such copious remarks in it from the first hour we started, and at every place you came to, that I thought you were compiling a *Guide to the North*; and without asking you the question point-blank, which I considered would have been indelicate, I communicated my suspicions, sometimes in writing, sometimes verbally, to the innkeepers. "My friend," I said to them, "is desirous of every information about this spot, and particularly regarding your hotel charges: you must not speak to him as if you were aware of this, for he is pledged by the Messrs Gratesail, publishers, to secrecy and independence; but I am pleased with your house myself, and am willing, under the rose, to do you a good turn." Every time you put pen to paper in the coffee-room saved us half-a-crown apiece at least; there was quite a difficulty in some places in getting them to charge us anything at all; and I must say that, all along, you acted your part to perfection.'

'Acted my part! how dare you,' said I, in a towering passion, 'you base, horrid'—

'There now, you are going on to what is actionable,' interrupted Tom. 'You parsons never know when to stop, and you are, besides, the last people in the world to take a healthy and charitable view of things. This is how the matter stands: we have passed, by your own confession, a very sumptuous three weeks; we have given opportunities to a much maligned class of our fellow-countrymen to exhibit their reasonableness and civility; we have threatened a new unmitigated

guide-book, which you have both the power and the will to withhold; and, finally, we have had, I must say, an exceedingly cheap tour!'

GLIMPSES OF AFFAIRS IN AMERICA.

WE GET TO THE MISSOURI COMPROMISE.

STARTING with lofty notions of liberty and equality, the United States, as already noticed, have always, and now more than ever, been hampered with an institution at variance with public profession, and which—from a European point of view—is lowering in no small degree to national dignity. Seemingly ashamed of slavery as a too obvious fact, American writers hasten to assure us that it is a mere local usage depending on the municipal law of the states in which it happens to exist, and therefore in no way concerns the federal constitution. We are not going to plunge into a political dispute on this point. It is true that slavery derives its vitality from the laws of individual states, and if these laws were severally abrogated, the institution would be no more; but it is equally certain, that while these laws are in operation, the federal power is bound to give them international efficacy. The constitution imparts authority to slaveholders to pursue and seize their property, 'persons held to service,' anywhere within the boundaries of the Union—even where no slavery exists. Besides this old Fugitive Slave-law, lately strengthened by an act of congress, the constitution prescribes a method of making up a constituency to appoint members to the House of Representatives, by reckoning the ratio of free and bond persons. Doubtless, it is unfortunate that the constitution in any manner, however equivocal, recognised and gave force to the practice of holding slaves, and so took that mean stand in the matter of human equality which embarrasses American jurisprudence; but nothing, we think, is to be gained by shirking the fact, and taking a disingenuous view of the subject.

It has been mentioned that the purchase of Louisiana, in 1803, was a turning-point in the history of the Union. At this time, the institution was disappearing from the more northern Atlantic states; and by the celebrated ordinance of 1787, it was excluded from the large Indiana territory on the north-west, from which have been formed the prosperous free states of Ohio, Indiana, Illinois, Michigan, Wisconsin, and Iowa. It lingered still in New York and New Jersey, but southward from Pennsylvania, and westward as far as the banks of the Mississippi, it was as yet confined to the limits of the 'Old Dominion.' Kentucky was formed from a ceded portion of Virginia, Tennessee from North Carolina, and, in like manner, Alabama and Mississippi from portions of Georgia; but though adding to the number of states, and swelling the slaveholding interests in congress, these re-arrangements did not geographically extend the area of slavery.

The acquisition of the French province of Louisiana opened up a boundless prospect for slavery extension. For a number of years, the newly acquired tract of country remained a territory under federal authority. At length, in 1812, the lower part on the Gulf of Mexico was admitted as the state of Louisiana. The remainder of the purchase, stretching northwards on the west bank of the Mississippi, and embracing the rivers Arkansas and Missouri, was henceforth known as the Missouri Territory, over which settlers gradually spread themselves. In March 1818, a sufficient

population being consolidated, petitions from the inhabitants were presented to congress, praying for the admission of Missouri as a state. Now began the first resolute struggle between slavery and freedom. It was the wish of the petitioners to have the state admitted on equal terms with the state of Louisiana, in which the inhabitants were guaranteed all the privileges, that of holding slaves among others, which they had enjoyed under the French rule. This was firmly opposed. A degree of alarm concerning the spread of slavery had taken possession of legislators from the free states; and it was felt that now or never was the opportunity for checking its wonderful and unexpected growth in the far west. It must be allowed, that members of congress had been much too late in making this notable discovery—the whole nation, indeed, had been culpably negligent on the subject. If there was a general desire to admit no more states with slavery, the proper precaution would have consisted in enacting a law, like that of the ordinance of 1787, for ever excluding the institution from the territories out of which such states could possibly be formed. The defects of the federal constitution seemed to necessitate such a legislative measure.

It has been graphically said, that when a number of adventurers, British subjects, land on a newly discovered territory, and take possession in the name of the Queen, the common law of England, *ipso facto* established; and from that moment every member of the infant community, no matter what be his breed or colour, enjoys all the privileges, and comes under the usual obligations of freeborn Englishmen. In such a way does the British constitution act, and there is a decision and simplicity about it which cannot but command respect. The constitution of the United States is less comprehensive and peremptory. Plant it where you will, it settles no determinate social system. It proclaims freedom, but admits of slavery. All men are free, but freemen may hold slaves—'chattels human'—who though men *de facto*, are seemingly not men *de jure*. The British flag, God knows, has in its day sheltered much insolence, injustice, cruelty. Under it, eighty years ago, an audacious attempt—since regretted and atoned for—was made to rob English colonists of their inherent rights, and what the end of that was, we all know. Things are somewhat altered since Grenville passed the Stamp Act, or since good old Dr Johnson wrote *Taxation no Tyranny*. When we see the Union Jack floating from a vessel in the Atlantic, we feel a sound assurance that there is not the vestige of a slave on board. A sight of the American flag does not convey the same confidence; seen south from the capes of Virginia, two to one it is covering a cargo of slaves on the way to the market for 'chattels human' at New Orleans; for though the foreign slave-trade terminated in 1808, the coasting slave-trade did not, and is till this day in full operation. If this be thought a hard view of practices prevailing under the federal constitution, we cannot help it. The constitution is not that of a distinct nation, but simply the terms of compact by which a number of sovereignties—at present thirty-one—agree to hold together for the sake of mutual convenience and purposes common to the whole. Some of these sovereignties exclude slavery, some maintain it. The federal constitution, consequently, operates with considerable reserve on this delicate subject. It is anything you like to make of it. When extended over new territories, unless congress interpose an order to the contrary, the choice of domestic institutions is nominally left to the parties concerned. If, when the time comes, they choose to inaugurate slavery, good and well; it is all the same to the constitution. This is called 'freedom.' So much for theory. Let us now see how the thing practically works.

When a new tract of country is acquired by the

United States, it passes into the possession and under the control of the federal authorities, who hold it for the general behoof. If it be resolved to lay it out for a new state, it is first created a 'territory.' As such, it is the subject of an act of congress, from which body it receives an interim constitution, prescribing its boundaries, divisions, executive authorities, laws, judicial and political system. With a governor appointed by the president, it remains under federal tutelage, till on petition of its inhabitants it is admitted into the brotherhood of states. All this seems reasonable, and, in its general features, the practice affords a fine instance of that self-creative political organisation for which the Americans are celebrated. Analysing the acts of congress and presidents, we observe something less favourable. The federal constitution is silent about race or colour; but in interpreting it, American lawgivers arrive at the conclusion, that the United States are the property of whites, and that persons with a tinge of dark colour in their countenance, though born free, are not citizens. Within the last two months, this view of citizenship has been enforced by a high federal officer, one of the secretaries of state, who refused passports to some coloured free persons, on the ground that they 'were not citizens within the meaning of the constitution.' This may be a right or a wrong interpretation of the fundamental charter of the Union: it is, at all events, acted on without apparently exciting public challenge. Accordingly, in passing an act to organise a territory—as, for example, that of 1855, constituting the territories of Nebraska and Kansas—there is the following regulation in regard to voters: 'Every free white male inhabitant, twenty-one years old, an actual resident in the territory at the time of the passage of this act, and with the qualifications after described, may vote,' &c. Thus, at the very outset, a disqualification is imposed on free coloured persons, without the slightest regard to their means or their ability; and from this to 'holding persons to service,' is an easy transition. Such, however, are the prejudices against colour in the United States, that the most ardent lovers of freedom in Kansas, while suffering from pro-slavery aggression, never proposed to give the franchise to any but whites.

The federal constitution being indifferent to the spread or limitation of slavery, the will of congress and president for the time being is a kind of supplemental constitution, whence the internal policy of a new territory is moulded. Much usually depends on the political leanings of the president, who, being irremovable for four years, and armed with an enormous power of appointment to office, may be said to exercise a control more resembling that of a despot than a constitutional sovereign. The presidents of past times have, for the most part, had strong pro-slavery convictions, and thrown the balance of authority in that direction. Still affecting to allow fair play in the scramble between slavery and anti-slavery principles in the inchoate states, they would rather seem to have aided in imparting to them pro-slavery constitutions. Mr Pierce, the present president, thinks that if things are left to take their course in a territory, slavery, from its intrinsic qualities, will outstrip freedom. In his late message to congress, he says: 'It is the fact that in all the unsettled regions of the United States, if emigration be left free to act in this respect for itself, without legal prohibitions on either side, slave labour will spontaneously go everywhere in preference to free labour. Is it the fact that the peculiar domestic institutions of the southern states possess relatively so much of vigour, that wheresoever an avenue is freely open to all the world, they will penetrate, to the exclusion of those of the northern states?' Leaving the North to answer Mr Pierce's question, it is enough for us to know that the

pretended freedom communicated by congress and the constitution, produces an unseemly fracas in territorial organisation; so that ever and anon a battle is raging somewhere in the south or west. The act being passed which throws open the territory for settlement, a rush ensues from all points in the Union. Lawyers, schoolmasters, printers, and preachers from Massachusetts; farmers from Vermont and New Hampshire; mechanics and pedlars from Connecticut; storekeepers from Cincinnati, Philadelphia, and New York; planters with bands of 'servants' from Alabama and Kentucky; and loafers, rowdies, and ragamuffins from everywhere, are hastening on by steam-boat, railway, wagon, horseback, wheel-barrow, and on foot to the land of promise—struggling, pushing, driving, drinking, swearing, cheating, and it may be, fighting. The rule, if there be a rule, is every man for himself. The great thing is, who shall get the earliest clutch at the best localities; and not much ceremony is used in squatting and taking possession. In no time, a capital city is planted, hotels struck up, a state-house inaugurated, newspapers set agoing, and voting for territorial, civic, and judicial officers is in 'full blast.' In one sense, there is something grand in this restless onflow of Anglo-Americans over the domains of unclaimed nature. We are carried in imagination back to that most ancient of injunctions, 'to go forth to replenish the earth, and subdue it.' To be sure, the thing is done coarsely—very. But it is done somehow; and from the chaos of a first settlement, spring in due time order and civilisation. What we have occasion to deplore is, the totally unnecessary and undesirable scramble for slavery or freedom in the new settlements. We need hardly say that, according to all accounts, the slaveholding interests take care to assume such a dictatorial attitude in these freshly opened lands, that under favour of the federal executive, they are able to overawe opposition, and to prefer claims to congress for a pro-slavery constitution, which cannot well be withstood. That congress should all the while complacently stand aside, on the presumption that a free choice is to be made, and at last legislate on this understanding, seems only to be a method of wilfully extending slavery to the further limits of the Union. Of course, should congress attempt to legislate prospectively in favour of freedom, it will have imputed to it that it is unconstitutionally taking a side—doing what it has no business to do; acting as umpire between free and slave states. We have the best evidence, however, that congress does possess authority to exclude slavery from the territories. Jefferson's ordinance of 1787, excluding it from the north-west territory, was an enactment of the last continental congress, which has been repeatedly recognised and sanctioned by the federal congress. It is evident, therefore, that until a new and more comprehensive federal constitution is adopted—if ever that will be—the proper course of policy is for congress to pass a general enactment, for ever excluding slavery from all the territories of the United States. Mr Buchanan, we believe, maintains the doctrine, that the constitution limits the power of congress in this respect; while, on the contrary, his late opponent, Colonel Fremont, holds to the opinion that congress is constitutionally entitled 'to prohibit in the territories those twin-relics of barbarism—polygamy and slavery.' Moderate men of all parties, we should think, would wish to see congress resolutely embrace this latter opinion; but in order to do so with any chance of success, northern men would require to abandon that singularly temporising policy—that anomalous subserviency to southern interests—for which they have earned an unenviable reputation. It is notorious, that with all the prevalent alarm respecting the increasing power of slaveholders, and all the professions in favour of freedom, the North expresses no desire to do more

than seclude slavery within a certain geographical limit. That this has generally been the hapless policy of the free portion of the Union, is conspicuous in the history of the Missouri Compromise and subsequent events.

We now approach this famed compromise. In February 1819, the petition of the inhabitants of Missouri for the admission of their state, which had been some time under consideration, led to a hot debate in congress. In the House of Representatives, Mr Tallmadge of New York moved the following amendment on the proposed constitution: 'And provided that the introduction of slavery, or involuntary servitude, be prohibited, except for the punishment of crimes, whereof the party has been duly convicted, and that all children born within the said state, after the admission thereof into the Union, shall be declared free at the age of twenty-five years.' To this restriction, southern members objected, for the reason that congress had no right to impose such offensive terms. Missouri was entitled, like every other state, to choose its own institutions, so far as slavery was concerned. Threats were thrown out, that if the restriction were carried, the South would dissolve its connection with the Union. Tallmadge, who appears to have been a man of dauntless energy, referred to this new outcry: 'If a dissolution of the Union must take place, let it be so. If civil war, which gentlemen so much threaten, must come, I can only say, let it come. My hold on life is probably as frail as that of any man who now hears me; but while that hold lasts, it shall be devoted to the service of my country—to the freedom of man. If blood is necessary to extinguish any fire which I have assisted to kindle, I can assure gentlemen, while I regret the necessity, I shall not forbear to contribute my mite. Sir, the violence to which gentlemen have resorted on this subject will not move my purpose, nor drive me from my place. I have the fortune and the honour to stand here as the representative of freemen, who possess intelligence to know their rights—who have the spirit to maintain them. As their representative, I will proclaim their hatred to slavery in every shape—as their representative, here will I hold my stand, till this floor, with the constitution of my country which supports it, shall sink beneath me—if I am doomed to fall, I shall at least have the painful consolation to believe that I fall as a fragment in the ruins of my country.' Referring to menaces of violence, he continued: 'Has it already come to this: that in the congress of the United States—that in the legislative councils of republican America, the subject of slavery has become a subject of so much feeling—of such delicacy—of such danger, that it cannot be safely discussed! Are we to be told of the dissolution of the Union, of civil war, and of seas of blood? And yet, with such awful threatenings before us, do gentlemen in the same breath insist upon the encouragement of this evil; upon the extension of this monstrous scourge of the human race? An evil so fraught with such dire calamities to us as individuals, and to our nation, and threatening in its progress to overwhelm the civil and religious institutions of the country, with the liberties of the nation, ought at once to be met, and to be controlled. If its power, its influence, and its impending dangers, have already arrived at such a point that it is not safe to discuss it on this floor, and it cannot now pass under consideration as a proper subject for general legislation, what will be the result when it is spread through your widely extended domain? Its present threatening aspect, and the violence of its supporters, so far from inducing me to yield to its progress, prompt me to resist its march. Now is the time. It must now be met, and the extension of the evil must now be prevented, or the occasion is irrecoverably lost, and the evil can never be controlled.' Next, alluding to the

extension of empire over the vast territories of the west, he says: 'People this fair domain with the slaves of your planters; extend slavery, this bane of man, this abomination of Heaven, over your extended empire, and you prepare its dissolution; you turn its accumulated strength into positive weakness; you cherish a canker in your breast; you put poison in your bosom; you place a vulture preying on your heart—nay, you whet the dagger and place it in the hands of a portion of your population, stimulated to use it by every tie, human and divine. The envious contrast between your happiness and their misery, between your liberty and their slavery, must constantly prompt them to accomplish your destruction. Your enemies will learn the source and the cause of your weakness. As often as external dangers shall threaten, or internal commotions await you, you will then realise that, by your own procurement, you have placed amidst your families, and in the bosom of your country, a population producing at once the greatest cause of individual danger and of national weakness. With this defect, your government must crumble to pieces, and your people become the scoff of the world.'

Finally, the bill embodying the restriction was lost. The men of the north, we have said, strangely content themselves with seeing slavery fortify and extend itself, provided it keep within a certain limit. The required line of division appears to be that which bounds the cotton-producing lands of the south. Having lost Missouri territory, as a whole, the friends of freedom did not prevent the southern portion of it being organised as a territory, without any restriction as to slavery. This was accordingly done. Arkansas was set off as a distinct territory; and the usual means being employed to give it pro-slavery tendencies, it became ultimately (1836) a slave state.

The struggle about Missouri was renewed in December 1819 and January 1820. As there seemed no possibility of reconciling both branches of congress to a plan of restriction within Missouri, the idea of a compromise was suggested. It was proposed by Mr Thomas of Illinois to admit Missouri as a slave state; but, as a compensation, to exclude it prospectively from all the remainder of the old Louisianan territory, north of a certain latitude. His provision was—'And be it further enacted, That in all that territory ceded by France to the United States under the name of Louisiana which lies north of thirty-six degrees thirty minutes, north latitude, excepting only such part thereof as is included within the limits of the state contemplated by this act, slavery and involuntary servitude, otherwise than in the punishment of crime whereof the party shall have been duly convicted, shall be, and is hereby for ever prohibited.' This compromise, after various divisions in both houses, was adopted. Missouri was enabled to enter the Union as a slave state. There was yet, however, another struggle connected with this troublesome matter. When the Missourians, in November 1820, submitted their state constitution to the approval of congress, it was found to contain some objectionable clauses, preventing the settlement of free men of colour in the state. As several northern states acknowledge free coloured men to be citizens, though the federal constitution, as usually interpreted, is much more exclusive, the objectionable clauses met with a warm opposition. At this juncture, a new character comes on the stage. Throughout the whole Missouri affair, Henry Clay, a statesman of no mean eminence, had given the aid of his counsels. If every man has his mission, Clay's seems to have been that of inventing compromises. He was an orator, a schemer—one of those mighty geniuses who have always a plan in their pocket to tide over difficulties, and who, in securing present peace, do not mind sowing the seeds of future discord. Clay's plan of engineering a difficulty was sublimely

simple. It consisted in compounding for so much evil by so much good. If a certain quantity of slavery was put in one scale, the same quantity of freedom, or *what looked like freedom*, was put in the other; so the balance was adjusted, and all parties satisfied. He is understood to have been the real concocter of the Missouri Compromise; and now, at this fresh and unexpected collision, he interposed with a scheme of settlement. It consisted in exacting a pledge from the Missouri legislature, that no advantage should be taken of its constitution, and it should pass no act 'to exclude any of the citizens of either of the states' from the enjoyment of the privileges they enjoy under the constitution of the United States. This qualifying provision was accepted. The only question is—who are 'citizens within the meaning of the constitution?' So ended the contests about Missouri, which was received into the Union as a full-blown slave state—a circumstance ever to be regretted, for, independently of other considerations, the state, as will be seen on looking at a map, projects considerably northwards into free territory, and so stops the way to free migration westwards. W. C.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER VIII.—DON RAMON.

On entering the courtyard, a somewhat novel scene presented itself—a Spanish picture, with some transatlantic touches. The patio of a Mexican house is its proper front. Here you no longer look upon jail-like door and windows, but façades gaily frescoed, curtained verandahs, and glazed sashes that reach to the ground. The patio of Don Ramon's mansion was paved with brick. A fountain, with its tank of japanned mason-work, stood in the centre; orange-trees stretched their fronds over the water: their golden globes and white wax-like flowers perfumed the atmosphere, which, cooled by the constant evaporation of the *jet d'eau*, felt fresh and fragrant. Round three sides of the court extended a verandah, its floor of painted tiles rising but a few inches above the level of the paved court. A row of *portales* supported the roof of this verandah, and the whole corridor was railed in, and curtained. The curtains were close-drawn, and except at one point—the entrance between two of the *portales*—the corridor was completely screened from our view, and consequently all the windows of the house, which opened into the verandah. No human face greeted our searching glances. In looking to the rear, into the great *corral*, or cattle-yard, we could see numerous peons in their brown leathern dresses, with naked legs and sandalled feet; vaqueros in all their grandeur of velveteens, bell-buttons, and gold or silver lace; with a number of women and young girls in coloured *naguas* and rebosos. A busy scene was presented in that quarter. It was the great cattle enclosure, for the estate of Don Ramon de Vargas was a *hacienda de ganados*, or grand cattle-farm—a title which in no way detracts from the presumed respectability of its owner, many of the noble *hidalgos* of Mexico being only *graziers* on a large scale.

On entering the patio, I only glanced back at the corral; my eyes were busy with the curtained verandah, and, failing there, were carried up to the azotea, in hopes of discovering the object of my thoughts. The house, as I have elsewhere stated, was but a single story in height, and from the saddle, I could almost look into the azotea. I could see that it was a sanctuary of rare plants, and the broad leaves and bright corollas of some of the taller ones appeared over the edge of the parapet. Abundance of fair flowers I could perceive, but not that for which I was looking. No

face yet shewed, no voice greeted us with a welcome. The shouts of the vaqueros, the music of singing-birds caged along the corridor, and the murmur of the fountain, were the only sounds. The two former suddenly became hushed, as the hoofs of our horses rang upon the stone pavement, and the heedless water alone continued to utter its soft monotone. Once more my eyes swept the curtain, gazing intently into the few apertures left by a careless drawing; once more they sought the azotes, and glanced along the parapet: my scrutiny still remained unrewarded.

Without exchanging a word, Wheatley and I sat silent in our saddles, awaiting the return of the portero. Already the peons, vaqueros, and wenches had poured in through the back gateway, and stood staring with astonishment at the unexpected guests. After a considerable pause, the tread of feet was heard upon the corridor, and presently the messenger appeared, and announced that the *dueno* was coming. In a minute after, one of the curtains was drawn back, and an old gentleman made his appearance behind the railing. He was a person of large frame, and although slightly stooping with age, his step was firm, and his whole aspect bespoke a wonderful energy and resolution. His eyes were large and brilliant, shadowed by heavy brows, upon which the hair still retained its dark colour, although that of his head was white as snow. He was simply habited—in a jacket of nankeen cloth, and wide trousers of like material. He wore neither waistcoat nor cravat. A full white shirt of finest linen covered his breast, and a sash of dull blue colour was twisted round his waist. On his head was a costly hat of the 'Guayaquil grass,' and in his fingers a husk cigarrito smoking at the end.

Altogether, the aspect of Don Ramon—for it was he—despite its assumed sternness, was pleasing and intelligent; and I should have relished a friendly chat with him, even upon his own account.

This, however, was out of the question. I must abide by the spirit of my orders: the farce must be played out; so, touching the flanks of my horse, I rode forward to the edge of the verandah, and placed myself *vis-à-vis* to the Don.

'Are you Don Ramon de Vargas?'

'Si, señor,' was the reply, in a tone of angry astonishment.

'I am an officer of the American army'—I spoke loud, and in Spanish of course, for the benefit of the peons and vaqueros. 'I am sent to offer you a contract to supply the army with beeves. I have here an order from the general-in-chief'—

'I have no beeves for sale,' interrupted Don Ramon in a loud indignant voice; 'I shall have nothing to do with the American army.'

'Then, sir,' retorted I, 'I must take your beeves without your consent. You will be paid for them, but take them I must; my orders require that I should do so. Moreover, your vaqueros must accompany us, and drive the cattle to the American camp.'

As I said this, I signalled to Holingsworth, who rode in with his following; and then the whole troop, filing through the back gateway, began to collect the frightened vaqueros, and set them about their work.

'I protest against this robbery!' shouted Don Ramon. 'It is infamous—contrary to the laws of civilised warfare. I shall appeal to my government—to yours—I shall have redress.'

'You shall have payment, Don Ramon,' said I, apparently trying to pacify him.

'Payment, *carrambo!*—payment from robbers, *filibusteres*'—

'Come, come, old gentleman!' cried Wheatley, who was only half behind the scenes, and who spoke rather in earnest, 'keep a good tongue in your head, or you may lose something of more value to you than your cattle. Remember whom you are talking to.'

'*Tejanos! ladrones!*' hissed Don Ramon, with an earnest application of the latter phrase that would certainly have brought Wheatley's revolver from his belt, had I not, at the moment, whispered a word in the lieutenant's ear.

'Hang the old rascal!' muttered he in reply to me; 'I thought he *was* in earnest. Look here, old fellow!' he continued, addressing himself to Don Ramon, 'don't you be scared about the dollars. Uncle Sam's a liberal trader and a good paymaster. I wish your beef was mine, and I had *his* promise to pay for it. So take things a little easier, if you please; and don't be so free of your "*filibusteres*" and "*ladrones*:" free-born Texans ain't used to such talk.'

Don Ramon suddenly cut short the colloquy by angrily closing the curtains, and hiding himself from our sight.

During the whole scene, I had great difficulty in controlling my countenance. I could perceive that the Mexican laboured under a similar difficulty. There was a laughing devil in the corner of his keen eye that required restraint; and I thought once or twice either he or I should lose our equanimity. I certainly should have done so, but that my heart and eyes were most of the time in other quarters. As for the Don, he was playing an important part; and a suspicion of his hypocrisy, on the minds of some of the leathern-clad *grasers* who listened to the dialogue, might have afterwards brought him to trouble. Most of them were his own domestics and retainers, but not all. There were free *rancheros* among them—some who belonged to the *puelblita* itself—some, perchance, who had figured in *pronunciamentos*—who voted at elections, and called themselves *citizens*. The Don, therefore, had good reasons for assuming a character; and well did the old gentleman sustain it.

As he drew the curtain, his half-whispered '*Adios, capitán!*' heard only by myself, sounded full of sweetness and promise; and I felt rather contented as I straightened myself in the saddle, and issued the order for *rieving* his cattle.

CHAPTER IX.

'UN PAPELCITO.'

Wheatley now rode after the troop, which with Holingsworth had already entered the corral. A band of drivers was speedily pressed into service; and with these the two lieutenants proceeded to the great plain at the foot of the hill, where most of Don Ramon's cattle were at pasture. By this arrangement I was left alone, if I except the company of half-a-dozen slippered wenches, the deities of the *cocina*, who, clustered in the corner of the patio, eyed me with mingled looks of curiosity and fear. The verandah curtains remained hermetically closed, and though I glanced at every aperture that offered a chance to an observing eye, no one appeared to be stirring behind them.

'Too high-bred—perhaps indifferent?' thought I. The latter supposition was by no means gratifying to my vanity. 'After all, now that the others are gone out of the way, Don Ramon *might* ask me to step inside. Ah! no—these mestizo women would tell tales: I perceive it would never do. I may as well give it up. I shall ride out, and join the troop.'

As I turned my horse to put this design into execution, the fountain came under my eyes. Its water reminded me that I was thirsty, for it was a July day, and a hot one. A gourd cup lay on the edge of the tank. Without dismounting, I was able to lay hold of the vessel, and filling it with the cool sparkling liquid, I drained it off. It was very good water, but not Canario or Xeres.

Sweeping the curtain once more, I turned with a disappointed glance, and jaggng my horse, rode

doggedly out through the back gateway. Once in the rear of the buildings, I had a full view of the great meadow already known to me; and pulling up, I sat in the saddle, and watched the animated scene that was there being enacted. Bulls, half wild, rushing to and fro in mad fury; vaqueros mounted on their light mustangs, with streaming sash and winding lazo; rangers upon their heavier steeds, offering but a clumsy aid to the more adroit and practised herds-men; others driving off large groups that had been already collected and brought into subjection: and all this amidst the fierce bellowing of the bulls, the shouts and laughter of the delighted troopers, the shriller cries of the vaqueros and peons. The whole formed a picture that, under other circumstances, I should have contemplated with interest. Just then, my spirits were not attuned to its enjoyment, and although I remained for some minutes with my eyes fixed upon it, my thoughts wandered elsewhere.

I confess to a strong faith in woman's curiosity. That such a scene could be passing under the windows of the most aristocratic mansion, without its most aristocratic inmate deigning to take a peep at it, I could not believe. Besides, Isolina was the very reverse. 'Ha! Despite that jealous curtain, those beautiful eyes are glancing through some aperture—window or loophole, I doubt not;' and with this reflection, I once more turned my face to the buildings.

Just then, it occurred to me that I had not sufficiently reconnoitred the *front* of the dwelling. As we approached it, we had observed that the shutters of the windows were closed; but these opened inward, and since that time one or other of them might have been set a little ajar. From my knowledge of Mexican interiors, I knew that these front windows were those of the principal apartments—of the *sala* and grand *cuarto*, or drawing-room—precisely those where the inmates at that hour should be found.

'Fool!' thought I, 'to have remained so long in the patio. Had I gone round to the front windows, I might have——' 'Tis not too late—there's a chance yet.'

Under the impulse of this new hope, I rode back through the corral, and re-entered the patio. The brown-skinned mestizas were still there, chattering and flurried as ever, and the curtain had not been stirred. A glance at it was all I gave; and without stopping, I walked my horse across the paved court, and entered under the arched *saguan*. The massive gate stood open, as we had left it; and on looking into the little box of the portero, I perceived that it was empty. The man had hid himself, in dread of a second interview with the Texan lieutenant!

In another moment, I had emerged from the gateway, and was about turning my horse to inspect the windows, when I heard the word 'Capitan,' pronounced in a voice that sounded soft as a silver bell, and thrilled to my heart like a strain of music.

I looked towards the windows. It came not thence; they were close shut as ever. Whence—Before I had time to ask myself the question, the 'Capitan' was repeated in a somewhat louder key, and I now perceived that the voice proceeded from above—from the *azotea*.

I wrenched my horse round, at the same time turning my eyes upward. I could see no one; but just at that moment an arm, that might have been attached to the bust of Venus, was protruded through a notch in the parapet. In the small hand, wickedly sparkling with jewels, was something white, which I could not distinguish until I saw it projected on the grass—at the same moment that the phrase 'Un *papelcito*' reached my ears.

Without hesitation I dismounted—made myself master of the *papelcito*; and then leaping once more

into the saddle, looked upward. I had purposely drawn my horse some distance from the walls, so that I might command a better view. I was not disappointed—Isolina! The face, that lovely face, was just distinguishable through the slender embrasure, the large brown eyes gazing upon me with that half-earnest, half-mocking glance I had already noticed, and which produced within me both pleasure and pain!

I was about to speak to her, when I saw the expression suddenly change: a hurried glance was thrown backwards, as if the approach of some one disturbed her; a finger rested momentarily on her lips, and then her face disappeared behind the screening wall of the parapet. I understood the universal sign, and remained silent.

For some moments I was undecided whether to go or stay. She had evidently withdrawn from the front of the building, though she was still upon the *azotea*. Some one had joined her; and I could hear voices in conversation; her own contrasting with the harsher tones of a man. Perhaps her father—perhaps—that other *relative*—less agreeable supposition!

I was about to ride off, when it occurred to me that I had better first master the contents of the '*papelcito*.' Perhaps it might throw some light on the situation, and enable me to adopt the more pleasant alternative of remaining a while longer upon the premises. I had thrust the *billet* into the breast of my frock; and now looked around for some place, where I might draw it forth and peruse it unobserved. The great arched gateway, shadowy and tenantless, offered the desired accommodation; and heading my horse to it, I once more rode inside the *saguan*. Facing around so as to hide my front from the *cocineras*, I drew forth the strip of folded paper, and spread it open before me. Though written in pencil, and evidently in a hurried impromptu, I had no difficulty in deciphering it. My heart throbbed exultingly as I read:—

'Capitan! I know you will pardon our dry hospitality? A cup of cold water—ha! ha! ha! Remember what I told you yesterday: we fear our *friends* more than our *foes*, and we have a *guest* in the house my father dreads more than you and your terrible *filibusters*. I am not angry with you for my pet, but you have carried off my lazo as well. Ah, capitan! would you rob me of everything?—Adios! ISOLINA.'

Thrusting the paper back into my bosom, I sat for some time pondering upon its contents. Part was clear enough—the remaining part full of mystery.

'We fear our *friends* more than our *foes*.' I was behind the scenes sufficiently to comprehend what was intended by that cunningly worded phrase. It simply meant that Don Ramon de Vargas was *Ayankiadeo*—in other words, a friend to the American cause, or, as some loud demagogues would have pronounced him, a 'traitor to his country.' It did not follow, however, that he was anything of the kind. He might have wished success to the American arms, and still remained a true friend to his country—not one of those blind bigots whose standard displays the brigand motto, 'Our country right or wrong,' but an enlightened patriot, who desired more to see Mexico enjoy peace and happiness under foreign domination, than that it should continue in anarchy under the iron rule of native despots. What is there in the empty title of *independence*, without peace, without liberty? After all, patriotism in its ordinary sense is but a doubtful virtue—perhaps nearer to a crime! It will one day appear so; one day in the far future it will be supplanted by a virtue of higher order—the patriotism that knows no boundaries of nations, but whose country is the whole earth. That, however, would not be 'patriotism!'

Was Don Ramon de Vargas a patriot in this sense—a man of progress, who cared not that the name of 'Mexico' should be blotted from the map, so long as

peace and prosperity should be given to his country under another name? Was Don Ramon one of these? It might be. There were many such in Mexico at that time, and these principally of the class to which Señor de Vargas belonged—the *ricos*, or proprietors. It is easy enough to explain why the Ayankieados were of the class of *ricos*.

Perhaps the affection of Don Ramon for the American cause had less lofty motives; perhaps the 5000 beeves may have had something to do with it? Whether or no, I could not tell; nor did I stay to consider. I only reflected upon the matter at all as offering an explanation to the ambiguous phrase now twice used by his fair daughter—'We fear our friends more than our foes.' On either supposition, the meaning was clear.

What followed was far from equally perspicuous. *A guest in the house dreaded by her father!* Here was mystery indeed. Who could that guest be?—who but Ijurra?

But Ijurra was her cousin—she had said so. If a cousin, why should he be dreaded? Was there still another guest in the house? That might be: I had not been inside to see. The mansion was large enough to accommodate another—half a score of others. For all that, my thoughts constantly turned upon Ijurra, and why I know not; but I could not resist the belief that he was the person pointed at—the guest that was 'dreaded!'

The behaviour which I had noticed on the day before—the first and only time I had ever seen the man—his angry speech and looks addressed to Isolina—her apparent fear of him: these it was, no doubt, that guided my instincts; and I at length came to the conviction that he was the fiend dreaded by Don Ramon. And she too feared him! 'God grant that she do not also love him!'

Such was my mental ejaculation, as I passed on to consider the closing sentences of the hastily written note. In these I also encountered ambiguity of expression; whether I construed it aright, time would tell. Perhaps my wish was too much parent to my thoughts; but it was with exulting heart I rode out from the gateway.

CHAPTER X.

AN OLD ENMITY.

I rode slowly, and but a few paces before reining up my horse. Although I was under the impression that it would be useless remaining, and that an interview with Isolina was impossible, for that day at least, I could not divest myself of the desire to linger a little longer near the spot. Perhaps she might appear again upon the azotea; if but for a moment; if but to wave her hand, and waft me an adieu; if but—

When a short distance separated me from the walls, I drew up, and turning in the saddle, glanced back to the parapet. A face was there, where hers had been; but, oh, the contrast between her lovely features and those that now met my gaze! Hyperion to the Satyr! Not that the face now before me was ugly or ill featured. There are some, and women too, who would have termed it handsome: to my eyes, it was hideous! Let me confess that this hideousness, or more properly its cause, rested in the moral, rather than the physical expression; perhaps, too, a little of it might have been found in my own heart. Under other circumstances, I might not have criticised that face so harshly. All the world did not think as I about the face of Rafael Ijurra—for it was he who was gazing at me over the parapet.

Our eyes met; and that first glance stamped the relationship between us—hostility for life! Not a word passed, and yet the looks of each told the other, in the plainest language, 'I am your foe.' Had we sworn it in wild oaths, in all the bitter hyperbole of insult,

neither of us would have felt it more profound and keen.

I shall not stay to analyse this feeling of sudden and unexpressed hostility, though the philosophy of it is simple enough. You too have experienced it—perhaps more than once in your life, without being exactly able to explain it. I am not in that dilemma: I could explain it easily enough; but it scarcely merits an explanation. Suffice to say, that while gazing upon the face of that man, I entertained it in all its strength.

I have called it an *unexpressed* hostility. Therein I have spoken without thought; it was fully expressed by both of us, though not in words. Words are but weak symbols of a passion, compared with the passion itself, exhibited in the clenched hand, the lip compressed, the flashing eye, the clouded cheek, the quick play of the muscles—weak symbols are words compared with signs like these. No words passed between Ijurra and myself; none were needed. Each read in the other a rival—a rival in love, a competitor for the heart of a lovely woman, the *loveliest* in Mexico! It is needless to say that, under such an aspect, each hated the other at sight.

In the face of Ijurra I read more. I saw before me a man of bad heart and brutal nature. His large, and, to speak the truth, beautiful eyes, had in them an animal expression. They were not without intelligence, but so much the worse, for that intelligence expressed ferocity and bad faith. His beauty was the beauty of the jaguar. He had the air of an accomplished man, accustomed to conquest in the field of love—heartless, reckless, false. O mystery of our nature, there are those who love such men!

In Ijurra's face I read more: *he knew my secret!* The significant glance of his eye told me so. He knew why I was lingering there. The satiric smile upon his lip attested it. He saw my efforts to obtain an interview, and, confident in his own position, held my failure but lightly—a something only to amuse him. I could tell all this by the sardonic sneer that sat upon his features.

As we continued to gaze, neither moving his eyes from the other, this sneer became too oppressive to be silently borne. I could no longer stand such a satirical reading of my thoughts. The insult was as marked as words could have made it; and I was about to have recourse to words to reply, when the clatter of a horse's hoofs caused me to turn my eyes in an opposite direction. A horseman was coming up the hill, in a direct line from the pastures. I saw it was one of the lieutenants—Hollingworth.

A few more stretches of his horse brought the lieutenant upon the ground, where he pulled up directly in front of me.

'Captain Warfield!' said he, speaking in an official tone, 'the cattle are collected; shall we proceed?'

He proceeded no further with that sentence; his eye, chance directed, was carried up to the azotea, and rested upon the face of Ijurra. He started in his saddle, as if a serpent had stung him; his hollow eyes shot prominently out, glaring wildly from their sockets, while the muscles of his throat and jaws twitched in convulsive action! For a moment, the desperate passion seemed to stifle his breathing, and while thus silent, the expression of his eyes puzzled me. It was of frantic joy, and ill became that face where I had never observed a smile. But the strange look was soon explained—it was not friendship, but the joy of anticipated vengeance! Breaking into a wild laugh, he shrieked out: 'Rafael Ijurra, by the eternal God!'

This awful and emphatic recognition produced its effect. I saw that Ijurra knew the man who addressed him. His dark countenance turned suddenly pale, and then became mottled with livid spots, while his eyes scintillated and rolled about in the unsteady glances of terror. He made no reply beyond the

ejaculation 'Demonio!' which seemed involuntarily to escape him. He appeared unable to reply; surprise and fright held him spell-bound and speechless!

'Traitor! villain! murderer!' shrieked Holingsworth, 'we've met at last; now for a squaring of our accounts!' and in the next instant the muzzle of his rifle was pointing to the notch in the parapet—pointing to the face of Ijurra!

'Hold, Holingsworth!—hold!' cried I, pressing my heel deeply into my horse's flanks, and dashing forward.

Though my steed sprang instantly to the spur, and as quickly I caught the lieutenant's arm, I was too late to arrest the shot. I spoiled his aim, however; and the bullet, instead of passing through the brain of Rafael Ijurra, as it would certainly have done, glanced upon the mortar of the parapet, sending a cloud of lime-dust into his face.

Up to that moment, the Mexican had made no attempt to escape beyond the aim of his antagonist. Terror must have glued him to the spot. It was only when the report of the rifle, and the blinding mortar broke the spell, that he was able to turn and fly. When the dust cleared away, his head was no longer above the wall.

I turned to my companion, and addressed him in some warmth:

'Lieutenant Holingsworth! I command!—'

'Captain Warfield,' interrupted he, in a tone of cool determination, 'you may command me in all matters of duty, and I shall obey you. This is a private affair; and, by the Eternal, the general himself!—Bah! I lose time; the villain will escape!' and before I could seize either himself or his bridle-rein, he shot his horse past me, and entered the gateway at a gallop.

I followed as quickly as I could, and reached the patio almost as soon as he; but too late to hinder him from his purpose. I grasped him by the arm, but with determined strength he wrenched himself free—at the same instant gliding out of his saddle. Pistol in hand, he rushed up the *escalera*, his trailing scabbard clanking upon the stone steps as he went. He was soon out of my sight, behind the parapet of the azotea.

Flinging myself from the saddle, I followed as fast as my legs would carry me. While on the stairway, I heard loud words and oaths above, the crash of falling objects, and then two shots following quick and fast upon each other. I heard screaming in a woman's voice, and a groan—the last uttered by a man. One of them is dead or dying, thought I.

On reaching the azotea—which I did in a few seconds of time—I found perfect silence there. I saw no one, male or female, living or dead! True, the place was like a garden, with plants, shrubs, and even trees growing in gigantic pots. I could not view it all at once. They might still be there behind the screen of leaves?

I ran to and fro over the whole roof; I saw flower-pots freshly broken. It was the crash of them I had heard coming up. I saw no men, neither Holingsworth nor Ijurra! They could not be standing up, or I should have seen them. 'Perhaps they are down among the pots—both. There were two shots. Perhaps both are down—dead!'

But where was she who screamed? Was it Isolina?

Half distracted, I rushed to another part of the roof. I saw a small *escalera*—a private stair—that led into the interior of the house. Ha! they must have gone down by it? she who screamed must have gone that way?

For a moment, I hesitated to follow; but it was no time to stand upon etiquette, and I was preparing to plunge down the stairway, when I heard shouting outside the walls, and then another shot from a pistol.

I turned, and stepped hastily across the azotea in the direction of the sounds. I looked over the parapet.

Down the slope of the hill two men were running at the top of their speed, one after the other. The hindmost held in his hand a drawn sabre. It was Holingsworth still in pursuit of Ijurra!

The latter appeared to be gaining upon his vengeful pursuer, who, burdened with his accoutrements, ran heavily. The Mexican was evidently making for the woods that began at the bottom of the hill; and in a few seconds more he had entered the timber, and passed out of sight. Like a hound upon the trail, Holingsworth followed, and disappeared from my view at the same spot.

Hoping I might still be able to prevent the shedding of blood, I descended hastily from the azotea, mounted my horse, and galloped down the hill. I reached the edge of the woods where they had gone in, and followed some distance upon their trail; but I lost it at length, and came to a halt. I remained for some minutes listening for voices, or, what I more expected to hear, the report of a pistol. Neither sound reached me. I heard only the shouts of the vaqueros on the other side of the hill; and this reminding me of my duty, I turned my horse, and rode back to the hacienda.

There, everything was silent: not a face was to be seen. The inmates of the house had hidden themselves in rooms barred up and dark; even the damsels of the kitchen had disappeared, thinking, no doubt, that an attack would be made upon the premises, and that spoliation and plunder were intended.

I was puzzled how to act. Holingsworth's strange conduct had disarranged my ideas. I should have demanded admission, and explained the occurrence to Don Ramon; but I had no explanation to give; I rather needed one for myself; and under a painful feeling of suspense as to the result, I rode off from the place.

Half-a-dozen rangers were left upon the ground, with orders to await the return of Holingsworth, and then gallop after us; while the remainder of the troop, with Wheatley and myself in advance of the vast drove, took the route for the American camp.

DR LIVINGSTONE AND HIS DISCOVERIES.

It is not our business to follow in the steps of the newspapers, but an event has recently taken place of an interest so peculiar in science and civilisation, that it must of necessity find a record in our pages. For a considerable time past, the world has now and then had scraps of information before it touching the remarkable travels of Dr Livingstone in Africa; and the conviction gathered upon most minds that this intrepid missionary was one of the greatest of modern discoverers. No book, however, came forth from the wanderer to give tangible evidence of the facts, and his voice was heard from time to time only as the voice of one crying in the wilderness. Great, therefore, was the excitement a few weeks ago, when it was found that, after an absence of sixteen years, he had returned, and that Dr Livingstone was actually to be seen in the body among the denizens of the metropolis.

Among the gatherings to greet this remarkable person, the most important, in a scientific point of view, was that of the Royal Geographical Society, on the evening of meeting, December 15. The ostensible business was to present the traveller, for the second time, with the highest distinction it is in the power of the Society to bestow—their gold medal. The first was given for traversing South Africa from the Cape of Good Hope by the Lake Ngami to Linyanti, and thence to the west coast, in 10 degrees south latitude; the present was for setting out anew from Linyanti, and completing the entire journey across South Africa.

Many interesting and crowded meetings have been held in the Society's rooms, but assuredly none more interesting or more crowded than on the occasion in question. Sir Roderick Murchison filled the chair with his accustomed tact and dignity; and among the eminent of his supporters were the Secretary of State for the Colonies, the Portuguese minister, Professor Owen, Sir John Richardson, and African travellers not a few, including Mr Gordon Cumming in full Highland costume. Among the ladies, whose presence added a charm to the meeting, sat Lady Franklin, her widow's cap betokening the sad fate of her brave husband in the regions of polar frost. Many more names might we enumerate; suffice it, however, that the rooms were overcrowded, numbers of visitors having to stand during the whole time of the meeting, which was prolonged to an hour unusually late.

The proceedings began at half-past eight, when Sir Roderick entered, accompanied by a gentleman about forty years of age, somewhat spare in face and form, of average height, dark hair, brow furrowed through hardships, and complexion deeply bronzed, almost black, from exposure to a scorching sun. The appearance of this man was hailed by a general clapping of hands, stamping of feet, and such other demonstrations as are resorted to by a British audience when they desire to express hearty admiration, esteem, and welcome. The stranger bowed and took his seat. Dr Norton Shaw, the secretary of the Society, read sundry formal notices, and then the important business of the evening began.

The stranger was the Rev. Dr Livingstone, missionary and traveller, the man who has taken away the opprobrium from African geography, who has accomplished what many have attempted in vain ever since the earliest days of Portuguese discovery—namely, a journey across the continent of Southern Africa, from the centre to the western coast, and from the western coast washed by the Atlantic to the eastern shores on which beats the thunderous surf of the Indian Ocean. And this he has done without any great flourish of trumpets—without pecuniary grants from government—without companions or escort, save what the friendship of the natives yielded. Trusting in Providence, and strong in his hopeful self-reliance, he went manfully through the work that lay before him to do.

We have from time to time incidentally mentioned in the *Journal* Dr Livingstone's movements and discoveries, and need not apologise for this completer notice, in which we need but to follow the proceedings of the meeting. The president, rising, reminded the company that the gold medal of the Society had been awarded to Dr Livingstone in 1855; and now, the much greater feat accomplished by the adventurous traveller made a similar presentation so much the more pleasurable a duty. Great was the applause as the missionary received the golden token by which the Society acknowledge and honour his meritorious services.

Dr Livingstone commenced his reply by an apology for his 'imperfections in speech-making.' Sixteen years' absence from England, and the habit of speaking only the Bechuana and other African dialects during nearly the whole of that time, checks his fluency in his native language. The effect is observable also in his manner of speaking, for there is a metallic, ringing character about his voice, similar to what is described as peculiar to certain African tribes, some of whose sounds resemble the striking together of pieces of copper. His style of speech, moreover, is homely—such as would be familiar to simple-minded men; hence there is a novel sort of pleasure in listening to

what he says. While he spoke, thanking the Society for the honour they had done him, and with great modesty of himself, we could enter into the spirit with which he wrote in one of his recent letters: 'I am not so elated in having performed what has not, to my knowledge, been done before, in traversing the continent, because the end of the geographical feat is but the beginning of the missionary enterprise. May God grant me life to do some more good to this poor Africa!' We unite in his 'hope that the medal will go down in his family as an heir-loom worth keeping.'

Then followed Mr Labouchere with a short speech and a resolution expressing thanks 'to the governors of the Portuguese settlements in Africa, who had so kindly received and entertained Dr Livingstone.' This was seconded by Sir Henry Rawlinson, of Ninevite fame; who told the meeting he wished the duty had fallen into abler hands, but that the chairman's commands were like the laws of the Medes and Persians, with which he (Sir H.) had some acquaintance. The resolution, we need hardly say, was carried by acclamation; his excellency Count Lavradio, the Portuguese minister, who asked leave to speak in French, making a very purpose-like speech in reply.

Then the secretary read portions of letters from Dr Livingstone, reserved especially for the meeting, giving an account of his travels, which were rendered the more interesting by *vis-à-vis* observations from the doctor himself. Our readers will perhaps remember that first among the enterprising missionary's exploits heard of in this country, was the discovery of the great Lake Ngami. This lake, it now appears, is for the most part shallow; fordable in places, and likely to dry up. This desiccation is no new phenomenon, for in the Bechuana country, and other regions to the south of the lake, there are ancient river-beds in which water has not flowed for ages, and most of the existing streams are dwindled to a mere rivulet. It is as if the interior of Africa were drying up. The commencement of the process is assigned by Dr Livingstone to a remote period, when a fissure made in a range of basaltic hills opened a new channel for the great river Leambye.

Up to the 20th parallel of south latitude, as is pretty well known, the drying process is well-nigh complete, for there the inhabitants depend, with rare exceptions, on fountains alone for their supply of water. But to the north of that parallel, the country is well watered, traversed, indeed, by a network of perennial rivers, and is of remarkable fertility. Elephants, giraffes, buffaloes, zebras, and many kinds of game abound, and three antelopes were shot of a species not yet known in England. The doctor's gun was the first ever fired in that country, and so inexperienced were the animals of their dangerous effects, that they stood still within bow-shot, and were easily killed. This is as different a country from the arid region to the south as from the western coast of Europeans, a maze of swamps and forests. It is elevated, cooled by pleasant breezes, and abounding in fruit and grain. This is the habitat of the true Nigritian, the curly-headed, jet-black negro, whose intelligent though simple race, when quickened by European knowledge, will one day rule the continent. A striking token of the direction of the genius of this people towards civilisation, is to be found in the social condition of their women. The will of the women is paramount, and at times they even become chiefs. 'If a man were asked to go anywhere,' said Mr Livingstone, 'or to agree to any arrangement, he answered: "I must go home and ask my wife." If she said "No," there was no possibility of getting him to move. Women sit in the councils; and while a Bechuana swears by his father, these negroes swear by their mother.' It may even be inferred that the ladies carry their supremacy a little too far. *If a woman beat her husband*, we are told, they are both taken to the market-place, and the wife is compelled

to carry her injured lord home on her back amidst the cheers of the people. On these occasions, the women generally cry out: 'Give it him again!' In all parts of his travel, the women shewed great kindness to Dr Livingstone and his party; and, what is noteworthy, the English name is known as that of a people 'who like the black man.'

But the most extraordinary circumstance announced by Dr Livingstone is the salubrity of this vast region. 'Some of the districts of the interior,' says he, 'are perfect *sanatoria*; and among the pure negro family, many diseases that affect the people of Europe are unknown. Small-pox and consumption have not been known for twenty years, and scrofula, cancer, and hydrophobia are seldom heard of.'

As regards natural resources, there are large beds of coal, and deposits of copper and iron ores; gold is found in the streams; grain is produced in immense abundance; indigo, quinine, senna leaves—the last in exhaustless supply; the sugar-cane flourishes, although the natives have no idea of sugar; there are whole forests of cinchona, and wax and honey, and valuable fibrous plants, one of which resembles flax—to say nothing of ivory, that can be obtained in any quantity. In one place, the grave of a chief was decorated by thirty large elephants' tusks placed upright in the ground. The country is so fertile, that in the gardens cultivated by the natives, a constant process of sowing and reaping goes on all the year round. All this was detailed by Dr Livingstone with the intelligence of real knowledge, for he is not one of those travellers who go abroad merely to look, describe appearances, and record impressions. Having a competent knowledge of various sciences, as he journeyed along he made observations astronomical, geological, and geometrical, noted the varieties of climate, and took botanical and zoological notes. In addition to these important matters, he had an eye to the commercial products of the various territories and the industrial habits of the natives, and their inclination to trade.

Dr Livingstone went far himself to solve the question as to how the resources of the country could be made available for trade. When first at Linyanti, he succeeded in persuading the chief to let him lead a party with merchandise to the western coast, under a promise to conduct them back. The journey was accomplished, and the party reached the Portuguese settlement of St Paul de Loando, amazed at what they saw of white men and their ways. Here was one path to the sea opened; and since then a second party, led by an Arab, despatched by the chief himself, have repeated the adventure, and safely. The doctor kept his promise, and conducted his troop back to their homes, from whence he afterwards guided them in the opposite direction.

It was in these journeys he found that a long sloping ridge rises between each coast and the interior, whereby the interior becomes a broad shallow basin, with so little outfall in some places, that rain-water lies on the plain until it is evaporated. It is probable that some of the water may find its way to the streams that feed the upper course of the Nile. The Leambye is, however, the principal drain. This is a magnificent stream. Dr Livingstone describes the scenery about the falls where the great river, similarly to the Nile, tumbles suddenly into the narrow basaltic cleft, as of wondrous beauty. The river was followed down to its confluence with the Zambezi, past the Portuguese settlements of Tête and Sena, and to Quilimane at the mouth on the Mozambique Channel. This was the second path to the sea.

But this mouth, as well as another to the south, has for many years been slowly filling up. For six months of the year, the bar at Quilimane is impassable, and always dangerous. A boat's crew of eight men from the *Dart* were all drowned in attempting to

pass it to convey a message to Dr Livingstone. This danger, it appears, may be avoided; for the doctor calls attention to the existence of other mouths with safe harbours further to the north, approachable at all seasons.

It is remarkable that the Zambezi, though deriving from the Leambye, is not flooded at the same time; for the latter inundates the upper country for hundreds of miles in July, when the former is all but dry; and in March and April, when the Zambezi is overflowing its banks, the Leambye is lowest.

Henceforth, a considerable portion of the blank in our maps of Africa will be filled up. The Mountains of the Moon, with their heretofore summits of snow, will probably turn out to be a range trending north-east from the Leambye, with glittering peaks of a rock resembling quartz, of which specimens have been laid before the Geological Society. As for the central region of the Gazetteers, scorched by an insufferable sun, in the rays of which no European could live, we have seen that it is in many important respects healthier than England, and a land abounding in natural wealth. As to the other contributions of Dr Livingstone to human knowledge, we have the testimony of the Rev. T. Maclear, astronomer at the Cape of Good Hope. 'The number of his observations,' writes this gentleman, 'is astonishing, when we consider the difficulties he had to encounter. He observed for latitude and longitude at every interesting point, particularly at the confluence of other rivers with the Zambezi, the bends, the falls, the more important villages. In short, he has opened up, geographically speaking, that hitherto unknown section of the continent. But he has done more: he has graphically described the character of the country, the inhabitants; and altogether his collection of facts would fill a volume, of deep interest to science, commerce, and, last not least, to humanity.'

After Dr Livingstone had concluded his discourse, various inquiries and observations were made by different speakers. Professor Owen said that he had had a conversation with the traveller seventeen years ago in the Museum of the College of Surgeons, and rejoiced to hear his accounts of great collections of fossil bones, and new forms of animal life. Mr Gordon Cumming related how much he owed to Dr Livingstone's hospitality while on his famous hunting-journey; and Captain Vardon, himself an African traveller, said that after hearing the narrative of a journey across the whole continent, he felt as if he had only been to Blackheath and back.

One word in conclusion about the missionary personally. David Livingstone was born in the village of Blantyre Works, Blantyre. He was the second son of Neil Livingstone, long a resident of the place, who, with his wife, Agnes Hunter, continued there for thirty years after their marriage. About sixteen years ago, the family removed to Hamilton, where the mother and two sisters of the traveller still reside, and under their care are his own children. He has two brothers in America—one in business in Canada, and the other a minister in the United States. David Livingstone wrought at the Blantyre mills as a piecer-boy; but subsequently, when he had attained to the dignity of a spinner, he attended the classes in Glasgow during the winter months, resuming his employment at the mills in the summer vacation. Having formed a connection with the London Missionary Society, he left the Blantyre Works; and after completing his studies at the college, Glasgow, he went out to Africa, and up to the Bechuana country, where he married a daughter of the zealous missionary Dr Moffat, whose name is well known in England. Here he was authorised by the London Missionary Society to explore the country to the north. When his travelling enterprise had succeeded as we have

seen, and Europe rang with his fame, the commanders of Her Majesty's ships in the Mozambique Channel had orders to inquire for Dr Livingstone; and in one of those ships he got a passage from Quilimane, and came home by the overland route.

THE STORY OF AN ENGAGED YOUNG PERSON.

It seemed a very long journey that we poor parliamentary passengers were taking, in this early November weather, all the way from London to Liverpool. The stoppages were frequent enough, but of such short duration, that we had scarcely time to get ourselves warmed at the crowded grate before the inexorable bell rang for us to start again, and off we went with a shriek into the blinding fog. It was positively too dark to read with any comfort, even if one was so indifferent to the biting air as to lend one of his hands to hold the book up: we put both of them in our pockets instead, or more usually sat upon them, to keep them warm. It was only when the guard came from time to time to look at our tickets, and trod upon our feet, that we began to feel we had them, so dead they were with cold.

'Sir,' observed a comical-looking tailor to this official, 'your seats are too narrow to be sat upon after my cross-legged fashion, so please be careful; for although my toes are frozen, they will not bear.'

This produced a laugh, and then arose a little talk, principally about how miserable we were, and then, as poor people use, we began to tell what our business was upon at Liverpool; whereupon it seemed that half the carriageful at least were emigrants. Each had his say; and every tale, however roughly told, had more or less of interest, because it was real and human, so that we quite forgot our weariness and cold for a little time. Then, since this had answered so well, the sprightly tailor proposed that one of the party should tell us a regular story, of his own life if he chose, but not only of his present circumstances, but of what had led to them—which was an idea we all received quite rapturously, expecting the tailor himself to begin. But he said no; we must draw lots for that. So producing some long slips of measuring-paper, he wrote a word on one, and shook them altogether in a hat, and sent it round. There was a great deal of giggling among the ladies, and a great deal of secret trepidation among the men, but for a long time nobody pulled out the fatal lot: at last a burst of laughter from those about one of the corner-seats announced that the victim had been selected, and that from among the ladies.

She was certainly the plainest of the female passengers. Her nose turned up, and her mouth had scarcely any turn at all; her hair was red, and so were the rims of her eyes; and her eyes themselves were far from being good ones; but there was a certain piquancy and sprightliness about her, too, as though she had been a French lady's-maid rather than an English one. She looked as if she could put her hand and her well-rounded arm to anything, and had been very good-tempered and obliging throughout the journey. It was understood—it had been expressed, indeed, already rather triumphantly by the young lady herself—that she was an engaged young person, going out to Australia to be married; that there was a somebody waiting upon the other hemisphere with outstretched hands, yearning to receive her as his bride. She would be a capital wife for a settler without doubt, although perhaps in England we should have called her rather a settler for a wife. She seemed to know very well, indeed, what we were all likely to think about this matter; but she didn't care.

If I had been better looking—she began her story

with this—I might never have got a husband, or at least not the money to marry him upon, which is the same thing. The unsuitableness of my face to what I may be allowed to call a very tolerable figure, has been literally the means of bestowing happiness, as I hope, upon Joseph, and of putting L.400 into my own pocket. And this was how it all came about: my late mistress, who was very kind to me, and had intended, poor thing—for she told me so—to leave me comfortably provided for, took me over with her, seven years ago, to Paris. She was a widow lady, fond of a gay life and brilliant amusements; and that place suited her so well, that she made it her home, and I, but little loath, remained there too. Joseph and I had kept company together before that time, but he was not so foolish as to wish me to give up my expectations for the sake of a hurried marriage; he said that he would wait patiently, dear fellow, although the great salt sea was to roll between us, and there could be no chance of his getting a letter more than once a day. He was a mason's assistant in London, and very hardly worked, it seemed, for he himself was not able to reply nearly so often; however, of course I was not a bird, that I could be in two places at once, so I made the best of it, and was as happy as a confidential lady's-maid, under such circumstances, could hope to be.

One evening I had been preparing my mistress, who was a very splendid dresser, for the opera; my only fellow-servant was on leave of absence for some days; and except the porter in the courtyard, there was nobody, when the carriage had driven off that night, in the whole house save myself; therefore, having nothing better—or at least nicer—to do, and being in my mistress's bedroom amongst her beautiful robes and ornaments, it was hardly to be expected that I should resist such an opportunity of trying them on. The room, besides being charmingly hung with mirrors, had a delicious full-length swinging-glass, and before this I amused myself for a good long while. I beheld how Mademoiselle Elizabeth Martin—that is my present name, but dear Joseph's is Andrews—how she looked in bareges, in silks, in muslins, for the morning; and how lace and satin, and low sleeves, with pearls, became her for evening wear; finally, equipping myself in a particularly pleasant glacé silk walking-dress, with a bonnet and falling veil fit for a bride, I could not help twisting round a little, to see as much of myself as possible, and contrasting the effect at the same time with that of madame—who was beautiful enough, but indifferently proportioned—I involuntarily remarked aloud: 'Well, we may be plain in the face, but we are certainly unexceptionable behind.' It was an absurd thing to say even to one's self, and I remember blushing like a beet, as though it were not quite out of the question that I could be overheard. There were several jewel-drawers—this ruby upon my middle finger, a ring belonging to my mistress's late husband, was in one of them—but I had no time for more than to set off a handsome necklace or two, and to very much regret that my ears had not been punched for the accommodation of an especial pair of diamond earrings, before I heard wheels in the courtyard, and my mistress came home. Everything had been put away very carefully, and I undressed her and saw her to bed as usual. She was more than commonly kind and gentle in her manner that night, as I have since thought at least; and when she wished me her *bon soir*, she added: 'I am sure we shall both be tired to-morrow, Bessie; so call me an hour later, and take an extra sleep yourself.' I was never to hear my good mistress speak any more.

Did I dream that night that she had left me all her wardrobe, and that I was married in the glacé silk? Did I, even in my sleep, build schemes of what I would do with the money that my dead mistress might enrich

me with? No; as I hope for heaven, and to meet dear Joseph, with all my woman's vanity, I had my woman's heart too, beating true and warm, and I thought no shadow of evil. I told them so in court, where all looked black against me, and they believed me even there. But in that morning, late, when the sun was shining full upon the window, and the noise of the people going about their daily work was full and clear, I saw a frightful sight, a ghastly horror that the day but served to make more hideous and unnatural—my mistress murdered in her bed! No answer when I knocked; again no answer. The curtains at the bedside were close drawn, but through the open shutters a fiery flood of light fell red upon the carpet and the curtains—ay, and on the corner of the snow-white counterpane, red also. It was blood! I thought there had been a rain of blood; upon the handles of the drawers, upon the toilet-cover, on the dressing-case, upon the towels, in the basin—everywhere where the murderer's hands had been after their deadly work; and in the bed—I dared not look in the bed; but in that great swing-glass, where I had decked myself but a few hours ago, I saw it all, and every mirror in the room was picturing the same sight—there lay the corpse, the murdered woman with her gaping throat. . . . They thought at first that I was murdered too, lying so stiff and cold in that death-chamber. I answered nothing to their questions, neither in the house nor in the prison. I knew nothing, nor could I have told them had I known, until Joseph came. It seemed to me then quite natural that he should be with me—nothing praiseworthy, nothing. (This dear little engaged young person's eyes began to get redder about the rims at this reminiscence, and her story to assume an incoherent as well as choky character.) I did not understand how much I owed him: how, not having heard from me for some time, and reading in the paper that an English lady's-maid had been taken up in Paris for a murder in the Rue St Honoré, but that she refused to speak, and even had perhaps in reality lost her senses, he started off at once, giving up his employ, and borrowing and begging what he could, and knowing no word of French but the name of that one street, he hurried to me: so that my mind came back again, and I could tell them what I knew. All he did, he said, was less than he ought to have done, because he had behaved ill to me of old (which, I am sure, dear Joseph never had, nor thought of doing). He stood by me in court—in the prisoners' place along with me he stood and shared my shame. I told about the jewels, and of my trying them on; how everything was safe, and the doors locked, and the chamber-window too high to be climbed up to, though a man might have let himself down from it into the yard. And then I learned for the first time that all that afternoon and night the murderer had lain hidden under my mistress's bed; that he must have been there all that time—think of it!—that I was trying on the dresses and the ornaments; that there was murder waiting in that chamber all the while: it made me shudder even then, amidst that crowded court, with Joseph by me. They thought it very strange, they said, that since there was so much time before him between my mistress's departure and return, that he had not murdered me instead. He had carried off all the jewels—those in the drawers as well as those which my poor mistress had worn that very evening; but from the moment he had dropped into the courtyard, the police could find no trace of him. A mere suspicion fell upon the brother of the gate-porter; but it was so vague that he was not put upon his trial. A great sum was offered in reward for the apprehension of the murderer, making up, with what was offered by my late mistress's family, nearly L.400. She died without a will, poor lady, and they were not disposed to give me anything beyond the wages due to me. After my acquittal, a collection for

mine and Joseph's benefit was made by some good people; but the money only sufficed to bring us back to England. Joseph had to work out a heavy debt, incurred upon my account, and I went into service again at once, resolving to do my best to help him. At the end of two years, poor fellow, except that he had discharged his obligation, he was but little better off than at their beginning; and despairing of ever getting a living for us both in the old country, he sailed twelve months ago for Sydney. Whichever of us first got rich, it was arranged, should cross the seas after the other; and until very lately, it seemed that we might each stop where we were, engaged young persons, till we died.

I was nursery-maid in my new place, and was taking the youngest child across Hyde Park one afternoon, when I was followed by an impertinent man; I had my "ugly" on, for the sun was hot, so that my face might have been like Venus, for all he knew to the contrary; and otherwise, I flatter myself I was not disagreeable looking. At all events, I attracted the wretch, who kept close behind me. He was an abominable person, with a foreign appearance—which I had reason enough for disliking—and eyes that looked different ways, but neither of them nice ways, so that I was glad enough to get in sight of the policemen about the marble arch. He saw that there was no time to be lost, if he meant to get a good look at me at all, so he passed me on a sudden very quickly, turned round, and looked up into my face. I gave him a very tolerable stare, too, because I knew it would disappoint him, after his great expectations; and it did so; and not only that, for it made him give a sort of villainous grin, which I hope I may never see again, and he broke out, as if he could not help it for the life of him, with 'Well, we may be plain in the face, but we are unexceptionable behind.' I cried out 'Murder' and 'Police!' as loud as I could, and the man was secured at once. No human being except the one who had been under the bed, her murderer, could have known those words, which I had spoken alone, before madame's toilet-glass. He denied everything, of course, and said it was an unjust detention; but in little more than half an hour, a telegraphic message from the Paris authorities set his mind at ease in this respect, and demanded his presence in that city. He was the elder brother of the gate-porter, whom I had never before seen; and what I had to tell, in addition to the previous suspicions against him, procured his conviction. He was sent to the galleys for life. This ruby ring, which he wore upon his little finger, I identified as having been in the jewel-drawer that very night. It was bestowed upon me after the trial by the heir-at-law, and I obtained besides the L.400 reward. If I had been pretty, you see, there would not have been any occasion for me to have remarked upon it that evening, and I might have remained, my whole life long, an engaged young person.

THE SMOKE-NUISANCE.

IN what combination of ingredients, typical of the 'dark livery of wo,' should the painter dip his brush or the writer his pen, who should attempt to set forth on canvas or paper the multiplied evils and miseries inflicted upon us by this gigantic annoyance! Who shall depict its ravages, or describe its effects upon our health, our linen, our spirits, our tempers?

Only let any one who has travelled, even as far as Paris, recall his first impressions of the noble effect produced by a great city spread out at his feet, as he gazed upon it from the column in the Place Vendôme, and the heights of Montmartre. Let him recollect the green trees of the boulevards, and the brilliant contrast of acacia foliage with white freestone, which, in the environs of that wonderful city, actually gladden

the heart with their sunny cheerfulness of aspect; and then let him turn to London; let him observe—when he can see them—the smoke-dried trees of our parks, and the soot-begrimed walls of our buildings, and the dull leaden hue of our atmosphere; and when he has it pressed home upon him, that the chief cause of this comparatively miserable state of things is sea-coal smoke, I think he will agree with me in thinking that any man who puts forward a plausible theory for the purification of the atmosphere of London, is entitled to a calm and dispassionate hearing.

It is indeed humiliating to an Englishman to return from a continental tour, or to arrive fresh from the pure air of the country, and take the plunge beneath the almost sable pall which at all times, when the household fires are lighted, broods over this great city!

We have no need to enlarge upon this topic; we all daily groan over it, and under it too; and the question still forces itself upon us: 'Can nothing more be done to get rid of the smoke-nuisance?'

We have applied a remedy—such as it is—to the evil, so far as it is connected with factories and steam-boats; but there are still tens of thousands of hearths manufacturing smoke below, and vomiting it forth above. It is my object to shew that a complete, not partial remedy, simple and practicable, is at hand; and that the abatement of the nuisance rests entirely with ourselves.

Perhaps some of my readers will say: 'The man is merely preluding a puff for Arnott's smoke-consuming grates;' and I hasten to assure them that, although concurring in the soundness of their principle, it is not my object in this paper to propose, as a cure for the evil in question, the universal—and to be universal it must be compulsory—use of the grates in question. Most assuredly, were I the autocrat of the British Isles, as Alexander is of 'All the Russias,' I would issue a ukase to compel the use of these fireplaces, if found, on mature experience, to be effectual for the object in view, rather than allow my capital to be seen from a distance only by its smoke; but, leaving the ingenious inventor of what I believe to be a meritorious system, to make his own way, I proceed to observe that, if I mistake not, there is a mode of achieving our object, which is far more universally applicable, and on many accounts preferable. I mean, that while this grate, or any other, which, properly attended to, will consume its own smoke, remains just where it was before, what I am about to propose would extend itself with more facility, and in most cases be more effectual, as requiring less skill and care in its application.

Perhaps it is as convenient a mode of approaching our subject as any other, if we allow ourselves to imagine the same thing done next session for private, that actually has been done for public chimneys—namely, a law made rendering it penal to throw smoke into the atmosphere after a given day. The question arises at once: 'What are we to do?' One would say, 'I will put up the smokeless grates;' another, 'I shall burn nothing but coke;' and a third, 'I shall adopt the plan of cooking by gas, and warm my house with gas stoves;' while still another might observe, that government should take care that the metropolis was served regularly with *anthracite coal*. Here you see, gentle reader, that in a moment no less than four separate plans are at once suggested by the urgency of the case supposed; and no practical man can have the least doubt that the adoption of any one of the four would completely answer his purpose, and keep him out of the meshes of the law. What I would propose, then, is simply, that either one or all of these methods should be rendered compulsory, according as experience shall establish the superior efficacy or economy either of that one, or a combination of them all.

Putting it in another form, my proposal is, that no smoke should be tolerated in large towns; and that it should be made universally known that, by the means enumerated above, all the objects attained by the use of fire can be arrived at without any necessity for producing smoke.

It only remains for me now to offer some observations in connection with the several processes adverted to, and endeavour to find out what may be the most desirable and practicable mode of bringing them into operation.

The Arnott grate, I doubt not, is a good contrivance; but it might be a curious speculation to inquire how long it would take before London could be supplied with it in its length and breadth, and from kitchen to garret, in all its manifold human habitations. For my own part, this idea alone would prevent my feeling sanguine of its coming effectually into play; but it might occupy a very important place in the proposed improvement. Being expensive, it would not suit the majority of cases as well as some cheaper system; but it might figure to advantage in a vast number of sitting-rooms, &c., belonging to the wealthier classes. In fact, it ought to be a most valuable adjunct, although, if I am right, it could not stand alone in doing the work proposed.

We come now to the other system, on which I base my chief expectations. Coal consists of *coke* and *gas*, popularly speaking. Gas is a heating as well as an illuminating power; and its value in the former sense is daily becoming better known—all the essential work of warming apartments can, it is now admitted, be not only performed economically with gas-stoves, but with a great accession of convenience and cleanliness. The very saving of a servant's time in carrying coals, and cleaning grates, &c., is a great economy, as every prudent housekeeper will readily admit. Now, supposing that a great development of the gas-system was to take place from a general use of this beautiful material for cooking and warmth; this would inevitably throw into the market a vast amount of smokeless fuel in the shape of coke. This is the very thing we require; for many will prefer to use a *calorifere* fed with coke, or some form of stove now in use to any other mode of warming. Some will prefer a char-coke fire in the kitchen to the gas-cooking plan; and some would probably combine the two, having a series of gas-burners for boiling, stewing, &c., and a clear fire for roasting; although this can be done admirably with gas alone. Lastly, it is highly probable that native anthracite would find its way to the metropolis in large quantities as soon as the smoke-nuisance was put down by law.

Now, since there are so many concurrent ways by which this object may be attained; and since far more than the first steps are already taken in the direction indicated here; and since the deliverance of London from its smoke would require merely an extension of means and appliances which are already at work, and become essential parts of our social system, I cannot but think that the time is come when all reasonable men ought to give this matter their serious consideration.

I do not for a moment doubt that what I propose is strictly practicable. It will not admit of question, that any London householder who chose it could, at this moment, resolve that within a week his house should cease to contribute its *quotum* of unconsumed carbon to the mass of city-smoke. He could put up at a few hours' notice the additional gas-fittings which would be required, where he chose that gas should do the work hitherto performed by coal alone; and, if he chose to vary it a little, he could obtain at a fair price a supply of coke for a portion of that work; and he could get an Arnott grate into his drawing-room, so as to enjoy still the pleasure of a 'cheerful fireside.' I give this in proof that what I recommend can be

done, and done effectually; but I am not so visionary as to let it escape me that what one could do, all could not do. The supply of gas and coke, depending on, and relative as they are to each other, is now capable of a certain extension, but that necessity has its limits. In order to carry out our plan *in extenso*, it would doubtless be necessary to create new means of supply; and it becomes a question of detail, into which I shall not attempt to enter now, what ~~mode~~ of doing this would be the best for the public—whether by 'consumers' companies' created for the occasion, or what else.

No doubt reasonable time should be allowed; and the carrying into effect a project of this kind may involve details which escape observation in the first instance. Let it only receive the attention which such a subject demands from gifted and practical men; and let not class interests and private considerations be allowed to sway the public judgment, and without a reasonable doubt it will speedily be found that what our 'collective wisdom' has seen fit to do in respect of the great smoke-producers, may be done rather more effectually as regards the smaller ones; and for this simple reason, that for private dwellings we have now access, as I have shewn, or can very easily obtain it, to a perfectly smokeless fuel, with the use of which we are already familiar; while the owners of factories, &c., have to contend with a real difficulty in trying to consume a smoky material without allowing any of the smoke to escape. I need not say how great this difficulty must be; but I would just insinuate that a good deal may be done by a strong determination to do it in accordance with those principles of feeding, and attention to detail, which are now tolerably well known.

Just think, gentle reader, of a *smokeless London!* a bright sky, green trees, the possibility of growing flowers in pots, and leaving pictures so that they can be seen. Think of being able to see one another across the street; and averting the danger of broken bones at every crossing in our autumnal and winter fogs! Think of all which is included in the idea of the removal of the smoke-nuisance, and then do what you can to effect it. If you can think of a better plan than mine, I shall most heartily welcome it. If you see any difficulty in what I propound, say so honestly, and I will either honestly admit it, or endeavour to shew you how it may be removed.

I need scarcely add, that I have taken London merely as a type—what is true there is true in Edinburgh (Auld Reekie!) or any other large city. May they all soon burn their smoke!

CALCULATING-MACHINE.

M. Thomas, of Colmar, says the *Moniteur*, has lately made the finishing improvements in the calculating-machine called the arithmometer, at which he has been working for upwards of thirty years. Pascal and Leibnitz, in the seventeenth century, and Diderot at a later period, endeavoured to construct a machine which might serve as a substitute for human intelligence in the combination of figures, but their efforts failed. M. Thomas's arithmometer may be used without the least trouble or possibility of error, not only for addition, subtraction, multiplication, and division, but also for much more complex operations, such as the extraction of the square root, involution, the resolution of triangles, &c. A multiplication of eight figures by eight others is made in 18 seconds; a division of sixteen figures by eight figures in 24 seconds; and in 1½ minutes one can extract the square root of sixteen figures, and also prove the accuracy of the calculation. The arithmometer adapts itself to every sort of combination. As an instance of the wonderful extent of its powers, we may state that it can furnish in a few seconds products amounting to 999,999,999,999,999,999,999,999,999—a marvellous number, comparable to the infinite multitude of stars which stud the firmament, or the particles of dust

which float in the atmosphere. The working of this instrument is, however, most simple. To raise or lower a nut-screw, to turn a winch a few times, and by means of a button to slide off a metal plate from left to right, or from right to left, is the whole secret. Instead of simply reproducing the operations of man's intelligence, the arithmometer relieves that intelligence from the necessity of making the operations. Instead of repeating responses dictated to it, this instrument instantaneously dictates the proper answer to the man who asks it a question. It is not matter producing material effect, but matter which thinks, reflects, reasons, calculates, and executes all the most difficult and complicated arithmetical operations with a rapidity and infallibility which defies all the calculators in the world. The arithmometer is, moreover, a simple instrument, of very little volume, and easily portable. It is already used in many great financial establishments, where considerable economy is realised by its employment.

A FIRESIDE SONG.

BY CALDER CAMPBELL.

GIVE Hope a place beside our evening-fire;
 'Twill add a warmer relish to its glow,
 And bring out pictures from the smouldering pyre
 Which darkness and despair can never shew;
 'Twill breathe of Night that ushers the glad Day,
 And the white Winter followed by green May.

'Twill draw forth images of suns that rise
 From the dark bosom of the passing mist—
 Of smiling glances drying tearful eyes,
 And wan cheeks into roses new health-kist;

Hope is not always false, whate'er men say,
 Since after Winter follows the green May.

Cold is the night, but colder is the street—

Be thankful for the fagot in the grate;
 And dwell on every mercy thou dost meet,

Blessing the Hand which spares thee griefs that wait
 On many a sufferer, in whose sterner way
 Lingers the Winter longer than the May.

Thank God for this, that Hope hath come from Him,
 And nestles in our hearts, like birds that find

'Neath some kind thatch shelter from hail-storm grim,
 And food where stacks of corn keep off the wind:
 Stay, heavenly Hope! and teach us well to pray
 That Winter may be followed by green May!

CRIME AND CRIMINALS IN LONDON.

London is labouring under a plague of criminals, so accurately known to the police, that the commissioners have actually reported their numbers to amount to 107 burglars, 110 housebreakers—the distinction is the commissioners', not ours—38 highway robbers, 773 pickpockets, 8657 sneaksman or common thieves, 11 horse-stealers, and 141 dog-stealers; besides a whole host of other offenders, but not habitually using violence, which swell the number of criminals in London to 16,900 known to the police. It is perfectly notorious that all these ruffians carry on their business as systematically as butchers and tailors—that they are never without the intent to commit a felony—and that, when they are not so doing, it is because they have not the opportunity. If the peace of London and the prosperity of its inhabitants—now preyed upon by those gentry to the extent of from £40,000 to £50,000 a year—could be secured by locking up less than 300 known, hardened, and incorrigible offenders, before they have the opportunity of committing another felony, we do not think that the British constitution, sensitive as it is, would sink under the shock.—*Morning Post*.

A SPIRITUAL EXTENSION OF A PHYSICAL LAW.

Of late years, the effects of different employments on the physical health of man have been freely discussed, and systematically traced, by means statistical and otherwise. That those effects are too often injurious, is an undisputed fact; while it is at the same time clear that they may be prevented, removed, or modified, by remedial contrivances or treatment. The maladies or malformations which arise from excess, possess their corresponding nostrum—moderation—or may be at least partially avoided by counteracting discipline proper to the case. Those which result from directly detrimental agency, can only be successfully combated by its mechanical removal or avoidance. The physiologist must use his skill to determine why a given kind of labour should give rise to a given form of ailment, and thus scientifically account for the cholic of painters, the wasting of grinders, the phthisis of masons, the gutta serena of needlewomen, or the nervous ruin of quicksilver miners. But it is sufficiently obvious to every one, without reference to any greater authority than common sense, that the multifarious complaints to which working flesh is heir by reason of its labour, are due to one common and adequate cause—the breach of physical laws, by fealty to which humanity holds vigour and life. If a man, regardless of gravitation, throws himself from a precipice, it is not surprising if his neck be broken and his limbs mangled; if he submerges himself in water, he may reasonably expect soon to become comatose; or if he takes shelter beneath a tree in a thunder-storm, it will not be very wonderful if the lightning strike him dead. Extreme as these illustrations may appear, they involve neither more nor less than the reason and cause for those slower but not less certain evils which follow the overstraining of a sense, the inhalation of unwholesome air, or a too sedentary mode of life.

It is not a part of my intention to enter more fully on this subject, as it affects the physical part of man—his body; I wish to point out that strictly analogous results, in obedience to a strictly analogous, or rather the same law, may be observed in the spiritual part of man—his mind. After all, the whole matter is but a corollary of the great principle of law which reigns throughout the universe, so far as man is cognizant thereof, and which, from a moral point of view, is expressed in the reflection, that the rain falls both on the just and the unjust. There is a noteworthy parallelism between the body and the mind running through the whole of man. Just as there is one great type of the human frame, to which all men conform, so is there

one type of soul. As the Caucasian mould is distinguishable from the Mongol, so the Caucasian mind is different from the Mongol. As nations physically differ, so mentally they vary; as family features bear the common mark of kinship, so do their spiritual attributes; and as each face possesses its own individuality, so has each character. Hereditary physique has its analogue in hereditary tone of mind; and it would not be difficult to adduce instances in which scientific, literary, or musical talent has descended through several generations. Although, therefore, character is essentially and originally diverse, there can be no doubt that its development, like that of the physical frame, may be perfect or imperfect, healthy or diseased, according to its surroundings and the facilities afforded it; and so far, and so far only, man is the creature of circumstance.

Mental philosophy, dealing with spiritual phenomena, evades the touchstone of experiment, is not amenable to units of reference, and owes no allegiance to ratios: thus it lies without the region over which the savant has dominion, and can never, perhaps, take its place amongst the exacter sciences. I say *perhaps*, because in these days of progress, especially physiological, it is hard to regard anything as entirely impossible. Nevertheless, from the infancy of philosophy it has been a recognised truth—without which recognition no mental philosophy could indeed exist—that there are spiritual laws no less sure in their effect, and constant in their energy, than those physical laws which ordain that the rain-drop should fall and the planets hold their untiring courses. And it is no less true, that in so far as man conforms to these spiritual ordinances, his mind shall be vigorous and healthy; and in so far as he disregards and violates them, his mind shall be distorted and diseased. It requires no difficult analysis to verify this conclusion by the characters of those we see around us in society. In the literature of fiction, in daily life, and colloquial speech, we discover a common conviction and thought, that different professions and occupations induce warped and diseased forms of character peculiar to themselves.

I believe that there may be and is a healthy conservatism; but I hold the conservatism of lawyers to be a professional disease. They deal habitually with dry forms, venerable to them for their antiquity, and valuable for the toil that has been bestowed upon them, though mummies to the world at large. It is hardly to be expected that a man will readily acknowledge the learned lore on which he has spent his best days, and to which he looks for sustenance and honour at the hands of society, to be outgrown, and only worthy of such respect as is due to a cast-off suit. No doubt

many a special pleader felt a pang, sharp and severe, when his elaborate and time-honoured entanglements were swept to the heap of things useless, and nuisances not to be endured; and many a conveyancer, mourning over the decline of his country, believes John Doe and Richard Roe to be as essential elements of the British constitution as her Majesty or the House of Lords. But worse than the conservative ailment is the disease of professional morality. It is the misfortune of patient students of the law that the moral elements of a 'case' have to be disregarded, or, rather, 'the height of reason' having determined generally what course is most conformable to moral law, it only remains to accept as the solution of the immediate question, the dictum or decision of a judge or bench of judges. The duty of the learned counsel is to make the best case he can for the litigant who fees him; to evade the telling of the whole truth, it may be; to explain away unpleasant facts; to influence the judge by an appeal to the law, and bamboozle, with appeals to the feelings, the jury. It is obvious that a man who devotes his whole energies to labour of this description, may easily become one-sided in his view of moral dignity and truth; but if the mere learned counsel is liable to somewhat stunted growth of the conscience, and monomaniacal antipathy to reform, the mere attorney is predisposed to graver forms of spiritual derangement. If the learned counsel is concerned with mummies, the mere attorney feeds on the skins of mummies. The pleader at least vivifies his antiquated notions with a galvanic semblance of life; he can shew how they were praiseworthy and useful in the year twelve hundred; but to the attorney they remain as lifeless as parchment, to the flavour of which his taste has been habituated. The moral element, even of feudal jurisprudence, does not come within his ken. His court of conscience is at Westminster. A right neither in equity nor at common law is no right at all. With him the first question is, 'Is there a loophole?' the second, 'Can my client slip through?' There is indeed a quasi-code for his guidance, that of respectability, which society has made for him; but the highest form of duty, which his inward eye can look upon and live, is his duty to his client, and the leading commandments for his government are: 'Thou shalt not make an unnecessary admission,' and 'Thou shalt not omit to take advantage of a point of law.' It is not to be wondered at that the practitioner becomes cautious and suspicious, disdainful of his fellow-men, a lover of technicality and detail, an upholder of red-tapism and routine, and that society styles him the keen, shrewd Mr Ferret.

In thus depicting the unwholesome character of Mr Ferret, I do not intend to throw an aspersion on a profession tempted in no ordinary way, and possessing many high-spirited and noble members: I could not reasonably do this, any more than I could truthfully represent the majority of needlewomen as blind, or of masons as consumptive; but assuredly there is some truth to be recognised in the legal characters as depicted on the stage; and there must be some shadow of ground for the gibes of satirists and the reproaches of common speech.

In a conversation on reading, some time ago given to the world by a celebrated essayist, it is laid down—I cannot exactly quote the words—that the direction of our leisure studies ought to be as much as possible opposite to the tendency of our profession and habits of life—that a lawyer, for instance, should read works of imagination, and, I may add, philosophy. The undeniable tendency of the study of the law, even in superior minds, is to narrow their view, and raise detail and form above principle. Nothing can be more philosophically true than the remark of the essayist; and for my own part, I conceive that even where the mind is naturally averse from a particular branch of thought,

thus shewing a natural inaptitude, great benefit may be derived from a forced attention to the unattractive subject; for the defective faculties will thus be strengthened, as the brawny arm of the smith is rendered muscular by the exercise of his craft. It is a noticeable fact, that the foremost law-reformer in the profession is one who is remarkable for his attainments and ability in literature and science.

Perhaps there is no more intelligent or better-informed body of men in English society than that which practises the medical profession. We will not examine too minutely into their antecedents, when they were students walking the hospitals; but take them as they are when settled in their country 'habitats,' in the exercise of their useful functions. Probably this superiority is owing, in the first place, to their necessary acquaintance with some of the most important and attractive sciences; and, secondly, to their varied experience of character under the most trying circumstances. It is true they are not remarkable for business-like virtues, but neither are they for business-like vices. They are, for the most part, religious without being fanatics, and take sensible and decided views on social questions without being hot partisans. Nevertheless, there are certain mental aberrations to which they are subject, and which arise from their familiarity with suffering and death, and the dependence which they daily observe of the mind on the body. There is a tendency to materialism in their philosophy, and sometimes an apparent callousness to pain. I don't know that it can properly be regarded as a fallacious prejudice that they detest medicine, and are fond of hard words.

Of clergymen of divers churches, it is needless and inexpedient to say much. The odium theologicum, a very virulent complaint, has always had its headquarters in the pulpit. Preachers generally take an intensely clerical view of everything, and winding about themselves the net of some hard theological dogmatism, their cry to the thirsting multitudes too often is, 'I am of Paul,' and 'I am of Apollos,' with a change of names and drapery. Dry divinity is one of the most astounding products of the professional mind, when we consider the all-embracing and lofty theme upon which the authors have to dwell. Very recently, we have seen how theological training can interrupt and bend aside the reasoning of a man of science in the *Essay on the Plurality of Worlds*.

Having thus lightly touched upon the three professions which, according to the satirists, thrive on the follies and vices of mankind, it is unnecessary to dwell on other classes presenting various forms of mental perversion peculiar to their respective callings. I merely suggest the pedantry of schoolmasters, the superficial pictures of the little newspaper editor, the hard demonstrative nature of the mathematician, the dreamy unrealism of the poet, the petty huckstering spirit of the retail trader, the unpractical thought of the theorist, and the anti-theoretical hostility of the practical man. There is one, and only one remedy for all—the education of the whole man, intellectually and morally. The threadbare adage of

A little knowledge is a dangerous thing;
Drink deep, or touch not the Pierian spring,

is eminently false. There is more danger in deep knowledge of one branch of thought exclusively, than in an elementary knowledge of many branches. In our day, division of labour has extended itself to literature and science. Neither does any injury to the dignity of human character necessarily arise from the peculiar devotion of its powers to that division of knowledge to which it is best adapted; but in order to retain spiritual health and symmetry, it is needful to make ourselves acquainted with the labour of other men in other fields, to widen our horizon while we are labouring in

our more familiar path. All nature is symmetrical; we live in a realm of order and mutual dependence, and if, disobeying the injunctions of our nature, we unduly develop one faculty, it will be at the cost of others; and our characters will become as unsightly to the eye of contemplation as a hunchback or a cripple to the outward sense.

The spiritual ailments and deformities to which I have alluded are essentially distinct from those brain diseases which depend on physical causes, and are the proper subjects of the science of the physiologist and the skill of the physician. Of mania and idiocy, in their various forms, I have not intended to speak; but it seems to me that those spiritual derangements which manifest themselves in the jaundiced mind, and in party prejudice and professional foibles, and may be comprised in the term wrongheadedness, are no less remediable than physical ills, and may properly be placed in the category of diseases of the soul, which it is not only for our advantage to combat, but our duty. Thus only can we realise the ideal of the poet:

Man the image of his God,
Erect and free.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XL—RAFAEL IJURRA.

IN ill-humour I journeyed along. The hot sun and the dusty road did not improve my temper, ruffled as it was by the unpleasant incident. I was far from satisfied with my first lieutenant, whose conduct was still a mystery. Wheatley could not explain it. Some old enmity, no doubt, both of us believed—some story of wrong and revenge.

No everyday man was Holingsworth, but one altogether of peculiar character and temperament—as unlike him who rode by my side as acid to alkali. The latter was a dashing, cheerful fellow, dressed in half-Mexican costume, who could ride a wild-horse and throw the lazo with any vaquero in the crowd. He was a true Texan, almost by birth; had shared the fortunes of the young republic since the days of Austin; and was never more happy than while engaged in the border warfare, that, with slight intervals, had been carried on against either Mexican or Indian foe-man, ever since the lone-star had spread its banner to the breeze. No raw recruit was Wheatley; though young, he was what Texans term an 'old Indian fighter'—a real 'Texan ranger.'

Holingsworth was not a Texan but a Tennessean, though Texas had been for some years his adopted home. It was not the first time he had crossed the Rio Grande. He had been one of the unfortunate Mier expedition—a survivor of that decimated band—afterwards carried in chains to Mexico, and there compelled to work breast-deep in the mud of the great *zanjas* that traverse the streets. Such experience might account for the serious, somewhat stern expression that habitually rested upon his countenance, and gave him the character of a 'dark saturnine man.' I have said incidentally that I never saw him smile—never. He spoke seldom, and, as a general thing, only upon matters of duty; but at times, when he fancied himself alone, I have heard him mutter threats, while a convulsive twitching of the muscles, and a mechanical clenching of the fingers accompanied his words, as though he stood in the presence of some deadly foe! I had more than once observed these frenzied outbursts, without knowing aught of their cause. Harding Holingsworth—such was his full name—was a man with whom no one would have desired to take the liberty of asking an explanation of his conduct. His courage and war-prowess were well known among the

Texans; but it is idle to add this, since otherwise he could not have stood among them in the capacity of a leader. Men like them, who have the election of their own officers, do not trust their lives to the guidance of either stripling or coward.

Wheatley and I were talking the matter over as we rode along, and endeavouring to account for the strange behaviour of Holingsworth. We had both concluded that the affair had arisen from some old enmity—perhaps connected with the Mier expedition—when accidentally I mentioned the Mexican's name. Up to this moment the Texan lieutenant had not seen Ijurra—having been busy with the cattle upon the other side of the hill—nor had the name been pronounced in his hearing.

'Ijurra?' he exclaimed with a start, reining up and turning to me with an inquiring look.

'Ijurra.'

'Rafael Ijurra, do you think?'

'Yes, Rafael—that is the name.'

'A tall, dark fellow, moustached and whiskered?—not ill-looking?'

'Yes; he might answer that description,' I replied.

'If it be the same Rafael Ijurra that used to live at San Antonio, there's more than one Texan would like to raise his hair. The same—it must be—there's no two of the name; 'taint likely—no.'

'What do you know of him?'

'Know?—that he's about the most precious scoundrel in all Texas or Mexico either, and that's saying a good deal. Rafael Ijurra? 'Tis he, by thunder! It can be nobody else; and Holingsworth—Ha! now I think of it, it's just the man; and Harding Holingsworth, of all men living, has good reasons to remember him.'

'How? Explain?'

The Texan paused for a moment, as if to collect his scattered memories, and then proceeded to detail what he knew of Rafael Ijurra. His account, without the expletives and emphatic ejaculations which adorned it, was substantially as follows:

Rafael Ijurra was by birth a Texan of Mexican race. He had formerly possessed a hacienda near San Antonio de Bexar, with other considerable property, all of which he had spent at play, or otherwise dissipated, so that he had sunk to the status of a professional gambler. Up to the date of the Mier expedition he had passed off as a citizen of Texas, under the new régime, and pretended much patriotic attachment to the young republic. When the Mier adventure was about being organised, Ijurra had influence enough to have himself elected one of its officers. No one suspected his fidelity to the cause. He was one of those who at the halt by Laredo, urged the impudent advance upon Mier; and his presumed knowledge of the country—of which he was a native—gave weight to his counsel. It afterwards proved that his free advice was intended for the benefit of the enemy, with whom he was in secret correspondence.

On the night before the battle, Ijurra was missing. The Texan army was captured after a brave defence, in which they slew more than their own number of the enemy, and, under guard, the remnant was marched off for the capital of Mexico. On the second or third day of their march, what was the astonishment of the Texan prisoners to see Rafael Ijurra in the uniform of a Mexican officer, and forming part of their escort! But that their hands were bound, they would have torn him to pieces, so enraged were they at this piece of black treason.

'I was not in that ugly scrape,' continued the lieutenant. 'As luck would have it, I was down with a fever in Brazos bottom, or I guess I should have had to draw my bean with the rest of 'em, poor fellows!'

Wheatley's allusion to 'drawing his bean' I understood well enough. All who have ever read the account of this ill-starred adventure will remember, that the

Texans, goaded by ill treatment, rose upon their guard, disarmed, and conquered them! but in their subsequent attempt to escape, ill managed and ill guided, nearly all of them were recaptured, and *decimated*—each tenth man having been shot like a dog! The mode of choosing the victims was by lot, and the black and white beans of Mexico (*frijoles*) were made use of as the expositors of the fatal decrees of destiny. A number of the beans, corresponding to the number of the captives, was placed within an earthen *olla*—there being a black bean for every nine white ones. He who drew the black bean must die! During the drawing of this fearful lottery, there occurred incidents exhibiting character as heroic as has ever been recorded in story.

Read from an eye-witness:

"They all drew their beans with manly dignity and firmness. Some of lighter temper jested over the bloody tragedy. One would say: '*Boys! this beats raffling all to pieces!*'" Another: "*Well, this is the tallest gambling-scraps I ever was in.*" Robert Beard, who lay upon the ground exceedingly ill, called his brother William, and said: "Brother, if you draw a black bean, I'll take your place—I want to die!" The brother, with overwhelming anguish, replied: "No, I will keep my own place; I am stronger, and better able to die than you." Major Cocke, when he drew the fatal bean, held it up between his finger and thumb, and, with a smile of contempt, said: "Boys! I told you so: I never failed in my life to draw a prize!" He then coolly added: "They only rob me of forty years." Henry Whaling, one of Cameron's best fighters, as he drew his black bean, said, in a joyous tone: "Well, they don't make much out of me anyhow: I know I've killed twenty-five of them." Then demanding his dinner in a firm voice, he added: "They shall not cheat me out of it!" Saying this, he ate heartily, smoked a cigar, and in twenty minutes after, he had ceased to live! The Mexican fired fifteen shots at Whaling before he expired! Young Torrey, quite a youth, but in spirit a giant, said that he "was perfectly willing to meet his fate—for the glory of his country he had fought, and for her glory he was willing to die." Edward Este spoke of his death with the coolest indifference. Cash said: "Well, they murdered my brother with Colonel Tannin, and they are about to murder me." J. L. Jones said to the interpreter: "Tell the officer to look upon men who are not afraid to die for their country." Captain Eastland behaved with the most patriotic dignity; he desired that his country should not particularly avenge his death. Major Dunham said he was prepared to die for his country. James Ogden, with his usual equanimity of temper, smiled at his fate and said: "I am prepared to meet it." Young Robert W. Harris behaved in the most unflinching manner, and called upon his companions to avenge their murder. * * *

"They were bound together—their eyes being bandaged—and set upon a log near the wall with their backs towards their executioners. They all begged the officer to shoot them in front, and at a short distance, saying they "*were not afraid to look death in the face.*" This request the Mexican refused; and to make his cruelty as refined as possible, caused the fire to be delivered from a distance, and to be continued for ten or twelve minutes, lacerating and mangling those heroes in a manner too horrible for description."

When you talk of Thermopylae, think also of Texas!

"But what of Holingsworth?" I asked.

"Ah! Holingsworth!" replied the lieutenant; "*he has good cause to remember Ijurra, now I think of it. I shall give the story to you as I heard it; and my companion proceeded with a relation, which caused the blood to curdle in my veins, as I listened. It fully explained, if it did not palliate, the fierce hatred of the Tennessean towards Rafael Ijurra.*"

In the Mier expedition, Holingsworth had a brother, who, like himself, was made prisoner. He was a delicate youth, and could ill endure the hardships, much less the barbarous treatment to which the prisoners were exposed during that memorable march. He became reduced to a skeleton, and worse than that, footsore, so that he could no longer endure the pain of his feet and ankles, worn skinless, and charged with the spines of acacias, cactus, and the numerous thorny plants in which the dry soil of Mexico is so prolific. In agony, he fell down upon the road.

Ijurra was in command of the guard; from him Holingsworth's brother begged to be allowed the use of a mule. The youth had known Ijurra at San Antonio, and had even lent him money, which was never returned.

"To your feet, and forward!" was Ijurra's answer.

"I cannot move a step," said the youth despairingly.

"Cannot! *Carrai!* we shall see whether you can. Here, Pablo," continued he, addressing himself to one of the soldiers of the guard; "give this fellow the spur; he is restive!"

The ruffian soldier approached with fixed bayonet, seriously intending to use its point on the poor way-worn invalid! The latter rose with an effort, and made a desperate attempt to keep on; but his resolution again failed him. He could not endure the agonising pain, and after staggering a pace or two, he fell up against a rock.

"I cannot!" he again cried—"I cannot march further: let me die here."

"Forward! or you *shall* die here," shouted Ijurra, drawing a pistol from his belt, and cocking it, evidently with the determination to carry out his threat. "Forward!"

"I cannot," faintly replied the youth.

"Forward, or I fire!"

"Fire!" cried the young man, throwing open the flaps of his hunting-shirt, and making one last effort to stand erect.

"You are scarce worth a bullet," said the monster with a sneer; at the same instant he levelled his pistol at the breast of his victim, and fired! When the smoke was blown aside, the body of young Holingsworth was seen lying at the base of the rock, doubled up, dead! A thrill of horror ran through the line of captives. Even their habitually brutal guards were touched by such wanton barbarity. The brother of the youth was not six yards from the spot, tightly bound, and witness of the whole scene! Fancy his feelings at that moment!

"No wonder," continued the Texan—"no wonder that Harding Holingsworth don't stand upon ceremony as to where and when he may attack Rafael Ijurra. I verily believe that the presence of the commander-in-chief wouldn't restrain him from taking vengeance. It ain't to be wondered at!"

In hopes that my companion might help me to some knowledge of the family at the hacienda, I guided the conversation in that direction.

"And Don Ramon de Vargas is Ijurra's uncle?"

"Sure enough, he must be. Ha! I did not think of that. Don Ramon is the uncle. I ought to have known him this morning—that confounded *mezcal* I drank knocked him out of my mind altogether. I have seen the old fellow several times. He used to come to San Antonio once a year, on business with the merchants there. I remember, too, he once brought a daughter with him—splendid girl that, and no mistake! Faith, she crazed half the young fellows in San Antonio, and there were no end of duels about her. She used to ride wild-horses, and fling the lazo like a Comanche. But what am I talking about? That *mezcal* has got into my brains, sure enough. It must have been *her* you chased? Sure as shootin', it was!"

'Probable enough,' I replied in a careless way. My companion little knew the deep, feverish interest his remarks were exciting, or the struggle it was costing me to conceal my emotions. One thing I longed to learn from him—whether any of these amorous duellists had been favoured with the approbation of the lady. I longed to put this question, and yet the absolute dread of the answer restrained my tongue! I remained silent, till the opportunity had passed. The hoof-strokes of half-a-dozen horses coming rapidly from the rear, interrupted the conversation. Without surprise, I saw that it was Holingsworth and the rangers who had been left at the hacienda.

'Captain Warfield!' said the Tennessean as he spurred alongside, 'my conduct no doubt surprises you. I shall be able to explain it to your satisfaction when time permits. It's a long story—a painful one to me: you will not require it from me now. This much let me say—for good reason, I hold Rafael Ijorra as my most deadly foe. I came to Mexico to kill that man; and by the Eternal! if I don't succeed, I care not who kills me!'

'You have not then'—

With a feeling of relief, I put the question, for I read the answer in the look of disappointed vengeance that gleamed in the eyes of the Tennessean. I was not permitted to finish the interrogatory; he knew what I was going to ask, and interrupted me with the reply:

'No, no; the villain has escaped; but by'—

The rest of the emphatic vow was inaudible; but the wild glance that flashed from the speaker's eye expressed his deep purpose more plainly than words. The next moment he fell back to his place in the troop, and with his head slightly bent forward, rode on in silence. His 'ark taciturn' features were lit up at intervals by an ominous gleam, shewing that he still brooded over his unavenged wrong.

CHAPTER XII.

THE YELLOW DOMINO.

The next two days I passed in feverish restlessness. Holingsworth's conduct had quite disconcerted my plans. From the concluding sentences of Isolina's note, I had construed an invitation to revisit the hacienda in some more quiet guise than that of a filibustero; but after what had transpired, I could not muster courage to present myself under any pretence. It was not likely I should be welcome—I, the associate—nay, the commander—of the man who had attempted to take the life of a nephew, a cousin! Don Ramon had stipulated for a 'little rudeness'; he had had the full measure of his bargain, and a good deal more. He could not otherwise than think so. Were I to present myself at the hacienda, I could not be else than coldly received—in short, unwelcome.

I thought of apologies and pretexts, but to no purpose. For two days I remained in vacillating indecision; I neither saw nor heard of her who engrossed my thoughts.

News from head-quarters! A 'grand ball' to be given in the city!

This bit of gossip fell upon my ear without producing the slightest impression, for I cared little for dancing, and less for grand balls: in earlier youth I had liked both; but not then.

The thing would at once have passed from my thoughts, had it not been for some additional information imparted at the same time, which to me at once rendered the ball attractive.

The information I allude to was, that the ball was got up 'by authority,' and would be upon a grand scale. Its object was political; in other words, it was to be the means of cultivating a friendly intercourse between the conquerors and the conquered—a desirable

end. Every effort would be made to bring out the 'native society,' and let it see that we Yankee officers were not such 'barbarians' as they affected to deem, and in reality pronounced us. It was known—so stated my informant—that many families of the Ayankieados would be present; and in order to make it pleasanter for those who feared *proscription*, the ball was to be a masked one—*un baillé de mascarita*.

'The Ayankieados are to be there! and she'—

My heart bounded with new hope; and I resolved to make one of the maskers—not that I intended to go in *costume*. In my slender wardrobe was a civilian dress of proper cut, and tolerably well preserved: that would answer my purpose. The ball was to come off on the night following that on which I had word of it. My suspense would be short.

The time appeared long enough, but at length the hour arrived, and mounting my good steed, I started off for the city. A brisk ride of two hours brought me on the ground, and I found that I was late enough to be fashionable.

As I entered the ball-room, I saw that most of the company had arrived, and the floor was grouped with dancers. It was evident the affair was a 'success.' There were four or five hundred persons present, nearly half of them ladies. Many were in character costumes, as Tyrolese peasants, Andalusian *majas*, Bavarian broom-girls, Wallachian boyards, Turkish sultanas, and bead-bedecked Indian belles. A greater number were disguised in the ungraceful domino, while not a few appeared in regular evening-dress. Most of the ladies wore masks; some simply hid their faces behind the coquettish *reboso tapado*, while others permitted their charms to be gazed upon. As the night wore on, and an occasional *copita de vino* strengthened the nerves of the company, the uncovered faces became more numerous, and masks got lost or put away.

As for the gentlemen, a number of them also wore masks—some were *en costume*, but uniforms predominated, stamping the ball with a military character. It was not a little singular to see a number of Mexican officers mingling in the throng! These were of course prisoners on *parole*; and their more brilliant uniforms, of French patterns, contrasted oddly with the plain blue dresses of their conquerors. The presence of these prisoners, in the full glitter of their gold-lace, was not exactly in good taste; but a moment's reflection convinced one it was not a matter of choice with them. Poor fellows! had they abided by the laws of etiquette, they could not have been there; and no doubt they were as desirous of shaking their legs in the dance as the gayest of their captors. Indeed, in this species of rivalry they far outstripped the latter.

I spent but little time in observing these peculiarities; but one idea engrossed my mind, and that was to find Isolina de Vargas—no easy task amid such a multitude of maskers. Among the uncovered faces she was not. I soon scanned them all, or rather glanced at them. It needed no scanning to recognise hers. If there, she was one of the *mascaritas*, and I addressed myself to a close observation of the *dames en costume* and the dominoes. Hopeless enough appeared the prospect of recognising her, but a little hope sustained me in the reflection, that, being myself uncovered, she might recognise me.

When a full half hour had passed away, and my lynx-like surveillance was still unrewarded, this hope died within me; and, what may appear strange, I began to wish she was *not* there. 'If present,' thought I, 'she must have seen me ere this, and to have taken no notice'—A little pang of chagrin accompanied this reflection.

I flung myself upon a seat, and endeavoured to assume an air of indifference, though I was far from

feeling indifferent, and my eyes as before kept eagerly scanning the fair maskers. Now and then, the *tourne* of an ankle—I had seen Isolina's—or the elliptical sweep of a fine figure, inspired me with fresh hope; but as the mascaritas who owned them were near enough to have seen, and yet took no notice of me, I conjectured—in fact, *hoped*—that none of them was she. Indeed, a well-turned ankle is no distinctive mark among the fair *doncellas* of Mexico.

At length, a pair of unusually neat ones, supporting a figure of such superb outlines, that even the ungraceful domino could not conceal them, came under my eyes, and riveted my attention. My heart beat wildly as I gazed. I could not help the belief that the lady in the yellow domino was Isolina de Vargas. She was waltzing with a young dragoon officer; and as they passed me, I rose from my seat, and approached the orbit of the dance, in order to keep them under my eyes. As they passed me a second time, I fancied the lady regarded me through her mask: I fancied I saw her start. I was almost sure it was Isolina!

My feeling was now that of jealousy. The young officer was one of the elegant gentlemen of the service—a professed lady-killer—a fellow, who, notwithstanding his well-known deficiency of brains, was ever welcome among women. She seemed to press closely to him as they whirled around, while her head rested languishingly upon his shoulder. She appeared to be contented with her partner. I could scarcely endure the agony of my fancies.

It was a relief to me when the music ceased, and the waltz ended. The circle broke up, and the waltzers scattered in different directions, but my eyes followed only the dragoon officer and his partner. He conducted her to a seat, and then placing himself by her side, the two appeared to engage in an earnest and interesting conversation.

With me politeness was now out of the question. I had grown as jealous as a tiger; and I drew near enough to become a listener. The lowness of the tone in which they conversed precluded the possibility of hearing much of what was said, but I could make out that the spark was 'coaxing' his partner to remove her mask. The voice that replied was surely Isolina's! I could myself have torn the silken screen from her face, through very vexation; but I was saved that indiscretion, for the request of her cavalier seemed to prevail, and the next instant the mask was removed by the lady's own hand. Shade of Erebus! what did I see? She was black—a *negress*! Not black as ebony, but nearly so; with thick lips, high cheek-bones, and a row of short 'kinky' curls dangling over the arch of her glistening forehead!

My astonishment, though perhaps of a more agreeable kind, was not greater than that of the dragoon lieutenant, who, by the way, was also a full-blooded 'southerner.' At sight of his partner's face he started, as if a six-pound shot had winded him; and after a few half-muttered excuses, he rose with an air of extreme *gaucherie*, and hurrying off, hid himself behind the crowd!

The 'coloured lady,' mortified—as I presumed she must be—hastily readjusted her mask, and rising from her seat, glided away from the scene of her humiliation. I gazed after her with a mingled feeling of curiosity and pity; I saw her pass out of the door alone, evidently with the intention of leaving the ball. I fancied she had departed, as her domino, conspicuous by its bright yellow colour, was no more seen among the maskers.

CHAPTER XIII.

THE BLUE DOMINO.

Thus disappointed, I gave up all hope of meeting her for whose sake I had come to the ball. She was either not there, or did not wish to be recognised, even by

me. The latter supposition was the more bitter of the two; and goaded by it and one or two other uncongenial thoughts, I paid frequent visits to the 'refreshment-room,' where wine flowed freely. A cup or two drove the *one idea* out of my mind; and after a while, I grew more companionable, and determined to enjoy myself like others around me. I had not danced as yet, but the wine soon got to my toes as well as into my head; and I resolved to put myself in motion with the first partner that offered.

I soon found one—a blue domino—that came right in my way, as if the fates had determined we should dance together. The lady was 'not engaged for the next;' she would be 'most happy.'

This, by the way, was said in French, which would have taken me by surprise, had I not known that there were many French people living in C—, as in all the large cities of Mexico. They are usually jewellers, dentists, milliners, or other artisans of that class, who drive a lucrative trade among the luxury-loving *Mexicanas*. To know there were French people in the place, was to be certain you would find them at the ball; and there were they, numbers of them, pirouetting about, and comporting themselves with the gay *insouciance* characteristic of their nation. I was not surprised, then, when my blue domino addressed me in French.

'A French *modiste*!' conjectured I, as soon as she spoke.

Milliner or no, it mattered not to me; I wanted a dancing partner; and after another phrase or two in the same sweet tongue, away went she and I in the curving whirl of a waltz.

After sailing once round the room, I had two quite new and distinct impressions upon my mind: the first, that I had a partner *who could waltz*, a thing not to be met with every day. My blue domino seemed to have no feet under her, but floated around me as if borne upon the air! For the moment, I fancied myself in Ranelagh or Mabilles! My other impression was, that my arm encircled as pretty a waist as ever was clasped by a lover. There was a pleasing rotundity about it, combined with a general symmetry of form and serpentine yieldiness of movement, that rendered dancing with such a partner both easy and delightful. My observation at the moment was, that if the face of the *modiste* bore any sort of proportion to her figure, she needed not have come so far from France to push her fortune.

With such a partner I could not otherwise than waltz well; and never better than upon that occasion. We were soon under the observation of the company, and became the cynosure of a circle. This I did not relish, and drawing my blue domino to one side, we waltzed towards a seat, into which I handed her with the usual polite expression of thanks.

This seat was in a little recess or blind window, where two persons might freely converse without fear of an eaves-dropper. I had no desire to run away from a partner who danced so well, though she were a *modiste*. There was room for two upon the bench, and I asked permission to sit beside her.

'Oh, certainly,' was the frank reply.

'And will you permit me to remain with you till the music recommences?'

'If you desire it.'

'And dance with you again?'

'With pleasure, monsieur, if it suit your convenience. But is there no other who claims you as a partner?—no other in this assemblage you would prefer?'

'Not one, I assure you. You are the only one present with whom I care to dance.'

As I said this I thought I perceived a slight movement, that indicated some emotion.

'It was a gallant speech, and the *modiste* is pleased with the compliment,' thought I.

Her reply :

'It flatters me, sir, that you prefer my company to that of the many splendid beauties who are in this saloon; though it might gratify me still more if you knew who I am.'

The last clause was uttered with an emphasis, and followed by a sigh!

'Poor girl!' thought I, 'she fancies that I mistake her for some grand dame—that if I knew her real position, her humble avocation, I should no longer care to dance with her. In that she is mistaken. I make no distinction between a milliner and a marchioness, especially in a ball-room. There, grace and beauty alone guide to preference.'

After giving way to some such reflections, I replied :

'It is my regret, *mam'selle*, not to have the happiness of knowing you, and it is not possible I ever may, unless you will have the goodness to remove your mask.'

'Ah! monsieur, what you ask is impossible.'

'Impossible! and why, may I know?'

'Because, were you to see my face, I should not have you for my partner in the next dance; and to say the truth, I should regret that, since you waltz so admirably.'

'Oh! refusal and flattery in the same breath! No, *mam'selle*, I am sure your face will never be the means of your losing a partner. Come! let me beg of you to remove that envious counterfeit. Let us converse freely face to face. I am not masked, as you see.'

'In truth, sir, you have no reason to hide your face, which is more than I can say for many other men in this room.'

'Quick-witted milliner,' thought I. 'Bravo, *Ran-lagh*! Vive la *Mabille*!'

'Thanks, amiable masker!' I replied. 'But you are too generous: you flatter me'—

'It is worth while,' rejoined she, interrupting me; 'it improves your cheek: blushes become you, ha, ha, ha!'

'The deuce!' I ejaculated half aloud, 'this *dame du Boulevard* is laughing at me!'

'But what are you?' she continued, suddenly changing her tone. 'You are not a Mexican? Are you soldier or civilian?'

'What would you take me for?'

'A poet, from your pale face, but more from the manner in which I have heard you sigh.'

'I have not sighed since we sat down.'

'No—but before we sat down.'

'What! in the dance?'

'No—before the dance.'

'Ha! then you observed me before?'

'O yes; your plain dress rendered you conspicuous among so many uniforms; besides your manner'—

'What manner?' I asked with some degree of confusion, fearing that in my search after *Isolina* I had committed some stupid piece of left-handedness.

'Your abstraction; and, by the way, had you not a little penchant for a yellow domino?'

'A yellow domino?' repeated I, raising my hand to my head, as though it cost me an effort to remember it—a yellow domino?'

'Ay, ay—a ye-ll-ow dom-in-o-,' rejoined my companion with sarcastic emphasis—'a yellow domino, who waltzed with a young officer—not bad-looking, by the way.'

'Ah! I think I do remember'—

'Well, I think you ought,' rejoined my tormentor, 'and well too: you took sufficient pains to observe.'

'Ah—aw—yes,' stammered I.

'I thought you were conning verses to her, and as you had not the advantage of seeing her face, were making them to her feet!'

'Ha, ha!—what an idea of yours, mad'm'selle!'

'In the end, she was not ungenerous—she let you see the devil!'

'The devil!' exclaimed I starting; 'you saw the *dénouement* then?'

'Ha, ha, ha!' laughed she; 'of course I saw the *dénouement*, ha, ha!—*droke*, wasn't it?'

'Very,' replied I, not much relishing the joke, but endeavouring to join my companion in the laugh.

'How silly the spark looked? ha, ha!'

'Very silly indeed—ha, ha, ha!'

'And how disappointed'—

'Eh?'

'How disappointed you looked, monsieur.'

'Oh—ah—I—no—I assure you—I had no interest in the affair. I was not disappointed—at least not as you imagine.'

'Ah!'

'The feeling uppermost in my mind was *pity*—pity for the poor girl.'

'And you really *did* pity her?'

This question was put with an earnestness that sounded somewhat strange at the moment.

'I really did. The creature seemed so mortified'—

'She seemed mortified, did she?'

'Of course. She left the room immediately after, and has not returned since. No doubt she has gone home, poor devil!'

'Poor devil! Is that the extent of your pity?'

'Well, after all, it must be confessed she was a superb deception: a finer dancer I never saw—I beg pardon, I except my present partner—a good foot, an elegant figure, and then to turn out'—

'What?'

'*Una negrilla*!'

'I fear, monsieur, you Americans are not very gallant towards the ladies of colour. It is different here in Mexico, which you term *despotic*.'

I felt the rebuke.

'To change the subject,' continued she; 'are you not a poet?'

'I do not deserve the name of poet, yet I will not deny that I have made verses.'

'I thought as much. What an instinct I have! O that I could prevail upon you to write some verses to me!'

'What! without knowing either your name or having looked upon your face. *Mam'selle*, I must at least see the features I am called upon to praise.'

'Ah, monsieur, you little know: were I to unmask those features, I should stand but a poor chance of getting the verses. My plain face would counteract all your poetic inspirations.'

'Shade of *Lucretia*! this is no needlewoman, though dealing in weapons quite as sharp. Modiste, indeed! I have been labouring under a mistake. This is some *dame spirituelle*, some grand lady.'

I had now grown more than curious to look upon the face of my companion. Her conversation had won me: a woman who could talk so, I fancied, could not be ill-looking. Such an enchanting spirit could not be hidden behind a plain face; besides, there was the gracefulness of form, the small gloved hand, the dainty foot and ankle demonstrated in the dance, a voice that rang like music, and the flash of a superb eye, which I could perceive even through the mask. Beyond a doubt, she was beautiful.

'Lady!' I said, speaking with more earnestness than ever, 'I entreat you to unmask yourself. Were it not in a ball-room, I should beg the favour upon my knees.'

'And were I to grant it, you could hardly rise soon enough, and pronounce your lukewarm leave-taking. Ha, monsieur! think of the yellow domino!'

'*Mam'selle*, you take pleasure in mortifying me. Do you deem me capable of such fickleness? Suppose for a moment you are not what the world calls beautiful, you could not by removing your mask, also strip

yourself of the attractions of your conversation—of that voice that thrills through my heart—of that grace exhibited in your every movement! With such endowments, how could a woman appear ill-looking? If your face was even as black as hers of the yellow domino, I verily believe I could not perceive its darkness.'

'Ha, ha, ha! take care what you say, monsieur. I presume you are not more indulgent than the rest of your sex; and well know I that, with you men, ugliness is the greatest crime of a woman.'

'I am different, I swear'—

'Do not perjure yourself, as you will if I but remove my mask. I tell you, sir, that in spite of all the fine qualities you imagine me to possess, I am a vision that would horrify you to look upon.'

'Impossible!—your form, your grace, your voice. Oh, unmask! I accept every consequence for the favour I ask.'

'Then be it as you wish; but I shall not be the means of punishing you. Receive from your own hands the chastisement of your curiosity.'

'You permit me, then? Thanks, mam'selle, thanks! It is fastened behind: yes, the knot is here—Now I have it—so—so'—

With trembling fingers, I undid the string, and pulled off the piece of taffety. Shade of Sieba! what did I see?

The mask fell from my fingers, as though it had been iron at a cherry heat. Astonishment caused me to drop it; rather say horror—horror at beholding the face underneath—the *face of the yellow domino*! Yes, there was the same negress with her thick lips, high cheek-bones, and the little well-oiled kinks hanging like corkscrews over her temples!

I knew not either what to say or do; my gallantry was clean gone; and although I resumed my seat, I remained perfectly dumb. Had I looked in a mirror at that moment, I should certainly have beheld the face of a fool.

My companion, who seemed to have made up her mind to such a result, instead of being mortified, burst into a loud fit of laughter, at the same time crying out in a tone of raillery: 'Now, Monsieur le Poète, does my face inspire you? When may I expect the verses? To-morrow? Soon? Never? Ah! monsieur, I fear you are not more gallant to us poor "ladies ob colour" than your countryman the lieutenant. Ha, ha, ha!'

I was too much ashamed of my own conduct, and too deeply wounded by her reproach, to make reply. Fortunately, her continued laughter offered me an opportunity to mutter some broken phrases, accompanied by very clumsy gestures, and thus take myself off. Certainly, in all my life, I never made a more awkward adieu. I walked, or rather *stole*, towards the entrance, determined to leave the ball-room, and gallop home. On reaching the door, my curiosity grew stronger than my shame; and I resolved to take a parting look at this singular Ethiopian. The blue domino, still within the niche, caught my eye at once; but on looking up to the face—gracious Heaven! it was *Iolinda's*!

I stood as if turned into stone. My gaze was fixed upon her face, and I could not take it off. She was looking at me; but, oh! the expression with which those eyes regarded me! That was a glance to be remembered for life. She no longer laughed, but her proud lip seemed to curl with a sarcastic smile, as of scorn!

I hesitated whether to return and apologise. But no; it was too late. I could have fallen upon my knees, and begged forgiveness. It was too late. I should only subject myself to further ridicule from that capricious spirit.

Perhaps my look of remorse had more effect than words. I thought her expression changed; her glance

became more tender, as if inviting me back! Perhaps—

At this moment, a man approached, and, without much ceremony, seated himself by her side. His face was towards me—I recognised Ijorra!

They converse. Is it of me? Is it of —? If so, he will laugh. A world to see that man laugh, and know it is at me. If he do, I shall soon cast off the load that is crushing my heart!

He laughs not—not even a smile is traceable on his sombre features. She has not told him, and well for him she has not. Prudence, perchance, restrains her tongue; she might guess the result.

They are on their feet again; she masks. Ijorra leads her to the dance; they front to each other; they whirl away—away: they are lost among the maskers!

* * *
'Some wine, mozo!'

A deep long draught, a few seconds spent in buckling on my sword, a few more in reaching the gate, one spring, and my saddled steed was under me.

I rode with desperate heart and hot head; but the cool night-air, the motion of my horse, and his proud spirit mingling with mine, gave me relief, and I felt calmer. On reaching the rancheria, I found my lieutenants still up, eating their rudely cooked supper. As my appetite was roused, I joined them at their meal; and their friendly converse restored for the time my spirit's equanimity.

FATHER MATHEW.

On Tuesday, the 9th December 1856, every vessel lying in Cork Harbour and river appeared with its colours half-mast high, and nearly every shop in the city had its shutters partially closed; for, on the previous day, Father Mathew, the beloved Apostle of Temperance, breathed his last at Queenstown. The local journals, Conservative and Radical, Whig and Tory, merging for once all points of sectarian difference, united in lamentations for a great and good man, and in bearing tribute to his worth. From their columns, and from other sources, but principally from an ably written article which appeared in the *Cork Examiner*, we shall compile a short biographical sketch of one of the most remarkable men of the age.

Theobald Mathew was born at Thomastown, in the county Tipperary, on the 10th of October 1790. The Mathews were originally an old English Catholic family, some branches of which came over to Ireland with Cromwell. One of this family is mentioned by Swift as 'the grand George Mathew,' who was remarkable for the extent and splendour of his hospitality. It is stated, that a gentleman who had made a wager that he would compel him to break a rule of his house, which was, never to ask the name of any one who chose to offer himself as a guest, lost his bet, notwithstanding that he stayed three weeks in the house, and conducted himself with as much impertinence as he could possibly assume.

The subject of this sketch was left with eight brothers and sisters, an orphan, at a very early age. Lady Elizabeth Mathew, a relative of his father, took him under her care, and sent him, at the age of thirteen, to the Roman Catholic college, Kilkenny. There he continued for some years; and having evinced a desire to enter the priesthood, his theological studies were completed, partly in Spain, and partly at Maynooth. At the age of twenty-three he was ordained, and after ministering for a brief period in Kilkenny, he was transferred to the house of the Capuchin order in Cork.

His conduct as a priest was exemplary. Not content with the ordinary labours attached to his office, he hired an old store next his chapel, which he converted into schools for the female children of his parish. At

one period, no less than 500 children were attending these schools. In this admirable effort he was seconded by a number of pious and charitable ladies of the city. In the year 1832, Asiatic cholera desolated Cork. Night and morning, Father Mathew was to be seen penetrating the miserable lanes of the most miserable parish in Cork, that of St Nicholas, seeking out subjects for the shelter of the hospital, and administering to them physical relief as well as spiritual consolation. During this dreadful time, his residence used to be besieged by claimants on his bounty, and none ever left it unaided or unanswered. On one occasion his secretary said to him: 'Sir, this is the last shilling we have.' His reply was: 'Give it, and let us trust to God.'

Great inconvenience was experienced by the poor of the city from the high price charged for burial-fee. In order to remedy this evil, Father Mathew took a piece of ground, known as the 'Botanic Gardens,' in the neighbourhood of the city, and converted it into a public burying-ground, a large portion of it being devoted gratuitously to the use of the poor. This, which is now one of the most beautiful cemeteries in these countries, afforded a most necessary accommodation during that cholera visitation, as well as during the terrible years of the famine-fever.

About this time, what may be called the public career of Father Mathew commenced. Hitherto, though his name was known far and wide throughout the country as the good and benevolent priest, yet the origin of his reputation lay almost entirely within the strict duties of his calling. He was now about to enter upon a course of exertion, which brought him a fame and a glory that cannot perish, but which at the same time entailed upon him endless troubles and vexations, beneath which his strong spirit eventually bowed, and to which may in no small degree be attributed his almost premature decay.

About the year 1830, a number of Cork gentlemen, including a Protestant clergyman, and some members of the Presbyterian body and of the Society of Friends, got up an association for the spread of temperance principles. The vice of intoxication had increased at that period to a fearful extent. The advance of education, and the consequently enlarged power of public opinion, had diminished its prevalence amongst the higher classes; but the poor had no such check upon their actions, and this deadly plague raged fearfully.

It was in vain that the newly formed society sought to counteract it: the good intentions of its members were recognised, but they had no influence over the people, and their society continued to exist for several years without having made any sensible advance. At length, in the month of April 1838, Father Mathew was induced to lend it his aid, and in a very brief period the power of his name was felt. Thousands flocked to his feet, to receive a pledge binding them to self-denial, of a character hitherto untried. Many drunkards joined it from a pure desire to reform, many from the excellent motive of wishing to afford a good example to their frailer brethren; very many from pure admiration of the good man who was now confessedly at the head of the movement; and vast numbers, who went to the meetings from motives of curiosity, in an enthusiastic impulse also joined. Thus the tide rolled from south to north, and west to east, until it spread over the entire country. Wherever Father Mathew went, he was hailed with delight and enthusiasm, and his progress was a kind of ovation rather than a journey of advocacy.

Miss Edgeworth thus describes the effects of the temperance movement in her own neighbourhood: 'In our village of Edgeworthstown, the whisky-selling has diminished since the "pledge" has been taken, within the last two years, so as to leave the public-houses empty, and to oblige the landlord to lower house-rent

considerably. This we know to our pecuniary loss—I need not add, to our moral satisfaction. The appearance of the people, their quiet demeanour at markets and fairs, has wonderfully improved in general; and to the knowledge of this family, many notorious drinkers, and some, as it was thought, confirmed drunkards, have been completely reformed by taking the pledge. They have become able and willing to work, and take care of their business; are decently clothed, and healthy and happy, and now make their wives and children healthy and happy, instead of, as before the reformation, miserable and heart-broken. Very few, scarcely any instances of breaking the pledge have as yet come to our knowledge; but some have occurred. The culprits have been completely shunned and disgraced, so that they are awful warnings to others. . . . Beyond all calculations, beyond all the precedents of experience, and all examples from the past, and all analogy, this wonderful crusade against the bad habits of nations, the bad habits and sensual tastes of individuals, has succeeded and lasted for about two years.'

The effect produced upon the sale of intoxicating drinks in Ireland was extraordinary. Distilleries and public-houses in numbers were closed. Personally, indeed, Father Mathew was a pecuniary sufferer, as he caused a large and flourishing distillery which belonged to his brother to be shut up, shortly after his undertaking the temperance advocacy.

The wonderful reformation of which he was the apostle in this country, soon made the name of Father Mathew famous far beyond the limits of his own country, and he soon became an object of attraction to all the sight-seers who visited Cork. Their astonishment was great to find this man, whose reputation had reached them in remote lands, whose extraordinary munificence was scarcely less remarkable than his reformatory zeal, dwelling in an unpretending house in an obscure corner of the city. They saw that his levées were chiefly of the poor; among whom he went as a father and a friend, distributing with soft caressing manner, and in words of kindness that came fresh from the heart, his advice and counsel. They could see also that he had won the affections of every class, and that polemical animosity did not exist towards him.

In the year 1843, Father Mathew made a tour through England and Scotland, where he was received with a cordiality, and even with an enthusiasm which shewed how completely respect for his character and appreciation of his motives had overcome the prejudice against his profession as a Roman Catholic clergyman. This feeling was substantially evinced on a subsequent occasion, when, owing to the largeness of his charities, he became so far involved in pecuniary difficulties, that he was actually arrested for debt in Dublin. On that occasion, the generous English people subscribed largely to relieve him from his embarrassments, and on the recommendation of Sir Robert Peel, a pension of £300 a year was granted him by the Queen. All this, however, merely went to satisfy the claims of his creditors, a sufficient answer to the trumpery charge which at one time was made, and which he even had to condescend to answer, that he was driving a trade in medals, and amassing wealth by means of the temperance movement! Had he sought riches, indeed, they might have been his; but as his heart was loving, his hand was open. Money he valued only as the means of assisting others, and the man who was one of the wonders of the age, and a benefactor to all who needed his assistance, has died himself a dependent, and not possessed of a shilling he could term his own.

The awful years of 1847 and 1848 afforded another opportunity for exhibiting the virtues of Father Mathew's character. About that period he received an invitation of a most flattering nature to visit Rome.

This he had always longed to do; but during the existence of the terrible ordeal through which his countrymen were then passing, he felt that his place was amongst them, and he remained in the plague-stricken city, distributing alms, organising committees of relief, and bringing the whole force of his powerful intellect to bear on the business of charity. The estimation in which his name was held was partly instrumental in obtaining from the American people their gift of corn, when disarming their ships-of-war: they crammed their magazines with food for the relief of the stricken country.

In the year 1849, Father Mathew was prevailed upon to visit the United States, in order to gratify the wishes of the millions of Irish who have made them their home. His reception, on his arrival at New York, was enthusiastic. Addresses from all quarters poured upon him; deputations from all the great cities of the States pressed to his presence, and he was fêted as an honoured guest in the White House. The restless disposition of the people kept him continually giving receptions, holding levées, and receiving demonstrations, until the mingled fatigue and excitement caused by the events of his American career, brought upon him two attacks of a disease from which he had suffered once before—paralysis. After recovering partially from the effects of the latter of these, he was advised to try the medicinal springs in the backwoods of Arkansas; and, accordingly, he spent the month of September in a log-hut in that remote locality, eight miles distant from any other human habitation. There he had no attendant but the old woman who owned the hut, and her son; and he was obliged to live upon Indian corn and the produce of the son's gun and fishing-net.

It was an interesting sight, we have been told, to see this pious ecclesiastic, who, wherever he went, had been saluted by the acclamations of thousands, offering up his act of adoration amidst the vast solitude of the pine-woods, the turf being his fragrant shrine, and his temple the great arch of God.

While in America, he administered the pledge to vast numbers of the Irish people resident there; and his departure from it was witnessed by all classes with a regret proportioned to their delight at his arrival.

We may here quote a sketch which Kohl, the German traveller, gives of him: 'I was formally introduced to the reverend chairman (at a temperance meeting), who presented me to Father Mathew. He is decidedly a man of distinguished appearance, and I was not long in comprehending the influence which it was in his power to exercise over the people. The multitude require a handsome and imposing person in the individual who is to lead them; and Father Mathew is unquestionably handsome. He is not tall; he is about the same height and figure as Napoleon, and is throughout well built and well proportioned. His countenance is fresh, and beaming with health. His movements and address are simple and unaffected; and, altogether, he has something about him that wins the good-will of those he addresses. His features are regular, and full of noble expression of mildness and indomitable firmness. His eyes are large; his forehead straight, high, and commanding; and his nose—a part of the face which in some expresses such intense vulgarity, and in others so much nobleness and delicacy—is particularly handsome, though somewhat aquiline. His mouth is small and well proportioned; and his chin round, projecting, firm, and large, like Napoleon's.'

From the time of Father Mathew's return from America, he never recovered his health. By this time, too, the movement to which he had devoted the energies of his life had suffered from various causes. The famine years, in depriving the people of all physical comforts, had induced moral degradation; and on his return, Father Mathew had the misery of beholding

the great fabric to which he had devoted almost superhuman energies, apparently crumbling away. The enthusiasm for total abstinence had in a great degree departed, and the numbers on the roll of teetotallers had diminished largely. But the effects of the movement had not passed away, and are still to be seen in the improved habits of the people, where they remain a standing monument to the man who alone could have effected that wonderful reformation.

As a proof of the high esteem in which he was held by the Roman Catholic clergy of the diocese, we may mention that, on the death of the Right Rev. Dr Murphy in 1847, he was returned by them *Dignissimus* to succeed him in the see of Cork. The choice of the pope, however, fell on another. Father Mathew was set aside, either because the temperance movement was of too secular a character, or because he was in receipt of a pension from the English government, or because he had been arrested for debt; any of which, perhaps, was considered a canonical objection.

In 1852, Father Mathew, by the advice of his physicians, visited Madeira; but he returned home only more disabled in health. For four years he lingered on; but though weak and ill, he preserved the same winning sweetness of manner, the same thoughtful kindness for his friends.

He took up his abode at Lehen, the residence of his brother, Mr Charles Mathew, situated at a short distance from Cork. There, the gate was surrounded with poor applicants for the reception of the pledge, for alms, or spiritual aid. These he still received with the same kindness as when in the fulness of his health and strength. Towards the close of last summer, he went to reside in Queenstown, where he continued gradually failing in health, until on Tuesday, the 2d of December, he was attacked with a sixth paralytic stroke. He lingered, quite conscious of his approaching end, until the following Monday, when, apparently without suffering, he breathed his last.

On Wednesday his remains were brought from Queenstown to the chapel dedicated to the Holy Trinity, which he had founded in Cork; and on Friday he was interred, with every possible demonstration of public respect and private affection.

Despite of the drenching rain which fell during the morning, crowds thronged the vicinity of the chapel. 'Father Mathew,' one man remarked, 'had stood bare-headed for many a long hour, trying to get us to give up the drink.' And there the assemblage, estimated at 80,000 persons, continued until the mortuary ceremonial within the chapel had concluded, and the long mournful procession issuing from the central porch, bore the mortal remains of its founder to the tomb in the centre of that cemetery which stands another monument of his benevolent exertions. As the coffin came in sight, one deep, sorrowing, heart-felt moan escaped from the immense multitude, swelling, ere long, into loud wailing and lamentation—no matter of course *keening*, but the expression of sincere sorrow. The shops in the city were all closed, and during the morning, business was completely suspended.

Theobald Mathew, his enemies themselves being judges, was a great philanthropist, and during many years a true benefactor to his country. May the 'good' that he has done not all be 'interred with his bones.' May poor Ireland once more shake off the thralldom of 'strong drink;' and by so doing, achieve for herself a greater deliverance, a truer freedom, than demagogue ever promised, or insurgent fought to gain.

In any but an *Irish* sketch, it would seem incongruous to conclude with an anecdote, which, however, is so genuine and so characteristic, that we cannot withhold it from our readers.

The proprietor of a large public-house in Cork was observed on the day of the funeral to be very demonstrative in his outward manifestations of mourning.

Not only did he appear in a suit of black with a long crape hat-band, but his shutters were kept strictly closed; not a chink was allowed to betray the nature of the liquid merchandise within.

'How is it,' asked a gentleman, 'that you are grieving for Father Mathew's death? I should have thought you would rather have rejoiced at it.'

'Ah, yer honour,' said the man, with that indescribable wink of mingled cunning and drollery which none but an Irish eye can contrive to execute—'sure I wouldn't sell a drop o' whisky to-night, if I didn't put up my shutters to-day!'

L A Y - M O N K S .

AMONG the favourite standard creations which the British public delights in having periodically served up for its delectation, must be reckoned the original old-established monk. This traditional personage, the *type moine*, as the French would say, may be said to flourish still, a thriving evergreen; and his appearance on the stage or in the novel scarcely ever fails to call forth the enthusiasm of every British heart. When Father Francis or Father Philip comes on the scene, bearing all his traditional marks and tokens about him, it is pleasant to see how he is at once recognised and greeted as an old acquaintance. The good man's shining poll, his person singularly developed about the epigastric region, his gait, which is slightly unsteady; in short, all the points belonging to the tradition are welcomed by the spectators as things familiar to them and their sires for generations back. We might almost fancy the holy men were to be seen every day in our streets, or were part of the 'institutions' of the country.

At the end of last century, the stage swarmed with monks, the horizon was clouded with crows and sad-coloured frocks—Sheridan and other ingenious mechanists supplying the article as wanted. The former fashioned a famous friar, to be found in the *Duenna*; and even through the sulphur and blue fire of the *Castle Spectre*, we catch a glimpse of a portly figure, who is facetiously accused of bearing about with him a 'tremendous tomb of fish, flesh, and fowl.'

Whence, then, this intimate knowledge of monk-physiology, this deep insight into monachologia? Has the tradition of Robin Hood's merry friar, or of the holy clerk of Copmanhurst, been so affectionately preserved that we have come to know their ways and habits, as it were by heart? Perhaps it is that the Briton respects and appreciates such sleek evidence of good cheer, although impregnated with the papistical leaven. And this mention of good cheer brings us to another scene, where cowl and frock enjoy high popularity. Those who have assisted at symposia fast and furious where convivial chanting has been in vogue, may perhaps recollect some ancient of the party beginning to quaver about the sanctity and other perfections of a certain 'Ho-ho-ho-ly Friar!' Alack! that lay extends unto many verses, and convivial generosity delights in full measure. 'Chorus, if you please, gentlemen,' sings our ancient: instant signal for roar of voices in divers vinous keys, all asseverating that the late reverend was 'such a Ho-ho-ho-ly Friar!' If another elder favour, as it is called, the company with a song, he will most likely select *The Friar of Orders Gray* or *The Monks of Old*; but there is an antique simplicity about the first-named chorus which insures for it a more enduring popularity.

With this strong faith in cloistral joviality, it is not surprising that certain merry spirits should have conceived the idea of assuming for the nonce the likeness of these monks of old, hoping that by this means the ancient monastic spirit would be revived in them once more. In the teeth of the well-established maxim, that the cowl maketh not the monk, they fancied that by

adopting the garb, their revels would acquire that traditional flavour which was supposed to be found in perfection at the monkish board. Accordingly, we find divers of these pseudo-monastic establishments flourishing at different periods during the last century; wherein, it must be confessed, the rule of St Dominic or St Benedict had but little part; and to the more important of these we now purpose inviting the reader's attention; and first for Medmenham Abbey and the order of 'Franciscans.'

The distinction of being the most notorious man of pleasure of his day belongs without dispute to Sir Francis Dashwood, Baronet. About the middle of last century, he first began his eccentric career, and, like a noble marquis of our own time, continued for many years to trouble the repose of the good lieges of the city. But soon the pleasing excitement of beating watchmen and abducting actresses began to pall upon him—even street-encounters were found to have lost their charm—and he began to cast about for some new and untried sphere of action. Accordingly, Jack Wilkes and some other famous 'bloods' were called into council; and it was agreed that, under existing circumstances, the only course open was to found an order of a penitential character, the members whereof should bear the name of Franciscans, after their noble founder.

An ancient mansion, beautifully situated on the banks of the Thames, was chosen as the residence of the new institute. Surrounded with hanging woods and moss-grown slopes, far away from the busy hum of men, it was in every way suited for the enjoyment of a calm and tranquil solitude. In days of old it had belonged to the Cistercian monks; but the holy walls were now destined to witness very different scenes. In the following summer, the prior, Sir Francis, with the rest of the brethren, including Mr John Wilkes, Mr Paul Whitehead, Sir Thomas Stapleton, and others remarkable for devotion and piety, repaired to the convent, and the 'exercises,' or rather the reign of riot, forthwith commenced. Every succeeding summer the same scenes were repeated; and Medmenham Abbey and its inmates became the wonder and the scandal of the country.

In *Chrysal*, or the *Adventures of a Guinea*, a now obsolete novel, written by an Irishman of that day, may be found a detailed account of the abbey and its inhabitants. At the secret rites of the chapter-room, none save the twelve brethren were permitted to be present. With such arcana we have no concern; but without coveting so edifying a prospect, there was enough left to puzzle and amuse the inquiring visitor.

Over the principal entrance was to be seen the famous Rabelaisian maxim: 'Fay ce que vouldras'—an encouraging precept, religiously observed. A little further on, another comforting motto met the eye: 'Aude, hospes, contemnere opes.' In the room where the brethren took their meals, was a statue of Harpocrates, the Egyptian god of silence, together with another of the female goddess of the same virtue. Thus was conveyed a hint to both sexes. There were beautiful gardens, laid out with consummate taste, ornamented with statues and fountains; there were fragrant groves, 'cool grot, and mossy cells'; while classical inscriptions, in harmony with the scene, met the eye at every turn.

With such attractions, it was no wonder that conventional life was found agreeable. Accordingly, for many summers did holy Abbot Francis and his twelve merry monks repair regularly to the favoured spot. But there was a change impending. To the astonishment of everybody, and most likely to his own, Sir Francis Dashwood, the baronet, found himself on a sudden transformed into a Chancellor of the Exchequer, and into a peer of the realm by the style and title of Lord le Despencer. Stranger still, he was discovered

to have actually built a church near his house! Jack Wilkes, too, had got deep into his *North Briton* troubles, and was battling hard with government and the Commons. Lord Sandwich, whose morals were about on a par with those of the late prior, affected to have been shocked with some of Mr Wilkes's verses, and had thought it his duty, as First Lord of the Admiralty, to bring their author to justice. These were so many interruptions to the calm tranquillity of the abbey. Poor Brother Whitehead, better known by the sobriquet of 'Paul the Aged,' succumbed at last to the weight of years, and was laid in Sir Francis's garden with strange pomp and fantastic ceremonies. A funeral urn was set up over him by his sorrowing patron. In this way the members dropped off, and the meetings came gradually to be given up.

The year 1809 witnessed the establishment of a new order at Newstead Abbey, under the auspices of the youthful Lord Byron. This was not quite so systematic or so earnest an effort as that of the Medmenham ascetics. The noble prior was then scarcely twenty-one, an age scarcely suited to so important a charge; but he had an admirable coadjutor in Charles Skinner Mathews, the very beau-ideal of good fellowship, who discharged his duties to perfection. He too, like 'aged Paul,' was soon swept away. It is impossible to look at the scanty memorials left to us of his wit and genius, and not feel convinced that he would have turned out a brilliant spirit of the Sheridan order.

The 'exercises' and general distribution of the day may be best described in his own words: 'For breakfast we had no set hour, but each suited his own convenience—everything remaining on the table till the whole party had done; though had one wished to breakfast at the early hour of ten, he would have been rather lucky to find any of the servants up. Our average hour of rising was one. I, who generally got up between eleven and twelve, was always—even when an invalid—the first of the party, and was esteemed a prodigy of early rising. It was frequently past two before the breakfast-party broke up. Then, for the amusement of the morning, there were reading, fencing, single-stick, or shuttle-cock, in the great room; practising with pistols in the hall; walking, riding, cricket, sailing on the lake, playing with the bear, or teasing the wolf. Between seven and eight we dined; and our evening lasted from that time till one, two, or three in the morning. The evening diversions may be easily conceived.'

This irregular existence Lord Byron seems to have enjoyed amazingly, and in his letters dwells with pleasure on the time when they all used 'to sit up late in our friary, drinking claret, champagne, and what not out of the *skull-cup* and all sorts of glasses, and buffooning all round the house in our conventual garments.' These 'conventual garments' were strictly canonical in shape and hue, though procured through the unsanctified medium of a masquerade warehouse, and consisted of a black frock with a cowl of the same colour. In this sombre garb would the brethren assemble in chapter, when the grim *skull-cup* in its silver mountings would be filled with choice Burgundy, and sent on its rounds. At the same solemn moment, would voices be uplifted, and the mystic *skull-song* chanted:

Start not, nor deem my spirit fled!
In me behold the only skull
From which—unlike a living head—
Whatever flows is never dull.

The ghostly monk who was supposed to flit about the ruined galleries of the old abbey, might be supposed to stay awhile his midnight wanderings, and frown angrily on this mockery of his ancient functions.

For another illustration of this eccentric taste for playing at monks, we must cross over into the sister-

island, and go back to the close of last century, and the last days of the Irish Parliament. At that most brilliant period of Irish history, more wit and talents were gathered together in the metropolis than it will ever be the fortune of that country to look upon again. Strange to say, this brilliant aggregate, we suppose by way of concentrating its spirit, fell into *conventual* shape; and thus was founded the order of the Monks of St Patrick, better known as the Monks of the Screw. It would be an idle task to enumerate here all that composed that choice company; it will be enough if we mention that in its ranks were to be found the honoured names of Grattan, Curran, Barry the painter, Hussey Burgh, Ponsonby, Corry, and Father O'Leary; of Lords Avonmore, Arran, Carhampton, Charlemont, Kingsborough, Mornington, Townshend, and Kilwarden. Nearly every one of its members attained to eminence in their respective professions, the brethren furnishing chief-justices, chancellors of the Exchequer, judges, and sergeants for many years to come. It will be seen, from the character of the members, that their meetings were of a very different description from the wild orgies of similar institutions on the other side of the water.

Every Saturday evening the community assembled in chapter in Lord Tracton's House, arrayed in the canonical costume of a black tabinet frock and cowl, with a cork-screw hanging from the waist by way of rosary. The chair was usually filled by the prior, the facetious Mr Curran, who in that capacity, as may be imagined, was all that could be wished; Judge Johnson did duty as sacristan; and Mr Doyle, a master in Chancery, officiated as abbot. Those chapter-nights were often looked back to in after-years with fond and vain regrets; and no wonder, for they were true feasts of reason, unalloyed with any feeling that might hereafter come back on them attended with shame or regret.

Such were these three notable societies, illustrating, we think, very curiously the strange chapter of human eccentricities.

A WORKING-MAN'S GROWL.

I MEANT to call this a grumble, but the dictionary says that grumble means to complain without a cause; and so, having plenty of cause for complaint, rather too much, I call it a growl. Those who read to the end, will find out whether it is properly titled or not.

I like fair play, I do; and I don't like being told there's fair play for everybody in this hard-worked old England of ours, when there isn't. If fighting against the longest odds is fair play—if being kept down is fair play—if 'dignity of labour' being made to look undignified, is fair play; then I give in at once, and acknowledge that I have been mistaken.

My growl doesn't mean biting: I don't blame anybody in particular; but somehow it seems as if it would ease my mind to speak out and say things that have lain heavy upon me for a good while. At times they bewilder me rather, especially when school-boy recollections of my old catechism put me on thinking I ought to be contented in my station of life. Who knows, if I say my say, perhaps some one who reads it may be able to give me a word of advice, or to tell me whether I am mistaken?

I'm a journeyman mechanic, always have been, and don't expect ever to be anything else, though I used to dream about it once. I can handle the plane and saw as well as anybody else, and can turn out a chest of drawers or a dining-table fit for any gentleman's house; ay, or the Queen's palace for the matter of that. I have worked for a good many masters in my time; if I hadn't, there wouldn't be anything for me to write about.

I shall never forget the master I was apprenticed

to. All through the month I was on trial, I had my meals with him and his wife in the parlour; tea and toast for breakfast, and so forth. But the very next morning after my father came over to bind me, I was trundled into the kitchen, and a basin of slop, called broth, was put before me, and a few stale crusts. And this was a sample of my fare for three or four years; however, by hook or by crook, I managed to get enough; and that was something for a growing boy. I needn't say much about my master: two facts will paint his portrait. He kept me good part of my time splitting up tough, gnarly old roots of oak and elm for firewood, that being his way of teaching me to make chairs and tables; and at other times, when I was taking my turn in the workshop, he would come up and say to me and the other apprentices: 'Let's see which can look the silliest;' and then he would make a fool's countenance to the best of his ability, and the more we laughed, the better pleased he seemed to be. It was generally after dinner when he did this.

Nobody will be surprised that such a man became a bankrupt. He was just one of those—of whom there are too many now-a-days—not fit to be a master. My indenture was given up to me; and so, before half my time was up, I was free to go and work where I liked as a journeyman. I got taken on at another shop in the same town, and being kept steadily at the bench, I learned my trade, and managed to save something out of the trifle of wages that was paid me. After I had once got into the knack of it, the man who could work quicker, or shew better or sounder workmanship than I did, would have had to get up pretty early in the morning. 'Do your best, come what may,' was a saying of my good old mother's, and it stuck by me.

There was a Mechanics' Institute in the town; I joined it, and got well laughed at by my shopmates, who accused me of a wish to 'sneak in among the aristocracy.' I was always fond of reading, and never was fond of the public-house, and so there was always some sort of antagonism between me and the others. 'You ain't a-going to come your superiority over us,' they said, when I refused to go to the tippling-parlour at the Cross-Keys. I went twice, and that took away from me all desire ever to go again. To say nothing of sitting three or four hours in the midst of tobacco-smoke, the talk was of the stupidest and silliest kind—perfect bosh indeed, mingled at times with petty scandal. To sit and listen to that was more than I could bear, and I went over to the Mechanics' Institute, though it wasn't by any means what it ought to be. Since then, I have found out, by living in other places, that the managers of Mechanics' Institutes don't know how to make them useful or attractive in such a way as would catch working-men, that otherwise would be willing to join.

Now and then we had lectures, and I used to feel proud when the lecturer told us of the mighty achievements of labour and industry, and how that every working-man could get on if he only would. That was just what I wanted to do; but my shopmates wouldn't let me. Here was the beginning of my experience, that it isn't the classes above him—if there be any above him—that keep a working-man down, but his companions, those among whom he works and lives.

It isn't comfortable to be in the same workshop with men who think they have a right to annoy you in any way short of actual violence, and it isn't every one that's philosopher enough to bear daily taunts, sneers, and suspicions. Because their way of spending their overhours was not my way, they being seven or eight, and I only one, they chose to put me in the wrong, and act accordingly. However, I didn't quarrel with them, except when they played tricks with my work or hid my tools, and then I made a demonstration that insured me a week's quiet. A favourite notion with

them was, that I was trying to curry favour with the master, and thereby get a run of the best work for myself; but this was a mistake. I never liked any of the masters I worked for, except one, well enough to make a friend of him, or ask favours; and as for the one then over me, he looked on his men as so many machines, out of which he had to make as much profit as possible; and he had, besides, a habit of putting off 'settling-day' as long as possible for himself, and longer than was convenient for me.

To a man whose wage is reckoned by shillings, any loss or stoppage, though small in itself, is felt at once, and seriously. He is saving for some special object—perhaps to buy a new coat or a watch—and notes already the time when the sparings of many weeks will enable him to effect his purpose. But he is exposed to see his expectations balked by the whims or greed of his master, or the caprices of a customer. One day, when I was at work on a chest of drawers, my master took it into his head that he would have the drawer bottoms tongued and grooved in the joints, contrary to all former practice. The 'stuff' was thin, and required delicate handling, and the joints took me half a day, instead of half an hour. What matters that, you will say, so long as 'twas paid for. That's just where it is; it wasn't paid for. The governor wouldn't give an extra half-penny for the making, and so I was half a day out of pocket.

There's no harm in my saying that I was quick at finding out new and readier ways of putting things together, so that I could finish in seven and a half or eight days a job that used to take me nine days. This did very well for a time or two; but by and by, when the master saw that I wanted a new job sooner than he had calculated, he wasn't long in finding out the reason why, nor in cutting down my wage. I remonstrated, but it was no use; he stuck hard and fast to this: 'If the job doesn't take you so long by a day, it isn't worth so much by a day.'

Nice encouragement this for a young fellow who worked hard, and tried to keep himself respectable; and when I thought of what the lecturers said at the Mechanics' Institute—that it depended only on the working-man himself whether he would get on or not, I made up my mind, feeling rather bitter at the same time, that they had never known what it was to work with none but working-men for companions, and for a master who considered nobody but himself.

Another trick the governor had that none of us liked—for we all had a taste of it—was to give us something—a chair, a wash-stand, or a few yards of carpet—to carry to a distant part of the town when we were going home for the evening. No matter how far it was, he would say: 'There, leave that as you go by. It isn't a yard out of your way,' when all the time the yard was a mile, very seldom less than half a mile. Not satisfied with the imposition, he took away whatever merit there was in our performance of it, and neutralised any satisfaction we might have felt in obliging him, by telling us the task wouldn't take us a yard out of our way. Why should a journeyman, whose spare hours are so few, be expected to give up a portion for a master who was so keen in cutting off the man's advantage in another way? My honest belief is, that nine out of ten masters ain't fit to be masters. Just think of having to go a mile out of your way on a cold or wet night, and missing the beginning of a lecture at the Mechanics' Institute!

Another thing: why should a man be made to lose so much time between job and job—and why should he have to wait so long for his money? Suppose you are at piece-work. Well, you get a pound or twenty-five shillings a week to keep you going, and the master makes up the difference—not at the end of the job, as he ought to, but when it pleases him, and that's generally about once a year. Is it fair the master should

keep what belongs to the man? Why shouldn't the man have it, and put it in the savings-bank, and have whatever interest it brings? One day, when my governor owed me about L.10, I said to him very civilly that I should be glad if he would settle,

'What do you want with your money?' he asked snappishly.

'I want to put it in the savings-bank.'

'Oh, you are afraid of me, are you? Well, I'll settle with you.'

And so he did. He paid me the arrears, and gave me notice that when the job in hand should be finished, I might suit myself elsewhere.

I shifted my quarters to London, thinking there would be more independence for a journeyman in the great city than in a country town. I soon found work, in a shop not a great way from Tower Hill, kept by a man who supplied two first-rate houses with furniture. Of course he had his profit to make, and to do that he cut down prices to so low a figure, that unless you worked like a little steam-engine, there was no chance of making living wages. I got experience, it is true, and enlarged my knowledge of the trade; but in other respects, I had jumped from the frying-pan into the fire. My shopmates, about twenty in number, were a set of the greatest scamps I ever fell in with. Their talk was filthy and profane, and their habits to match. I wasn't squeamish, but the language I could not help hearing day after day made me feel degraded: my self-respect was wounded. And because I couldn't laugh at remarks that were thought to be witty, but were only foul and brutal, I was nicknamed the Methodist.

As for a sense of duty, I don't believe there was one of them knew what it meant. They would rob the governor, and cheat him in all possible ways. Their work was too often as bad as themselves, and the ingenuity they exercised to conceal its inferiority, would have more than sufficed to gain them first-rate wages by honest work in a first-rate shop. Stealing anything that was not likely to be missed for the moment was not stealing, only 'carrying it home.' And how they drank! Five pints of porter a day was the average; but two or three took their sixteen pints. And how perverse! Often when they knew a job was wanted in a hurry, they took all possible pains to delay it, and the governor would be driven crazy by their vexatious idleness. It was at times amusing to see what shifts he resorted to in order to get his precious crew to go ahead. Now and then he would make a pretence of stopping a man in the middle of a job to set him on another, whereupon there would be a terrible outcry: 'Tain't fair,' and 'Don't you stand it,' would be heard from all parts of the shop. The man himself would avow his determination not to stand it, and in proof thereof, work away at the job in hand, and finish it all the sooner. This was just what the master wanted; but what harassments he had to go through in dealing with such an unprincipled set. He had a good stroke of business, yet for all that I wouldn't have changed places with him for all he was worth.

I could fill whole pages with the sayings and doings of that workshop; but what would be the good? The manners, or rather want of manners that prevailed, shocked and amazed me; but I have since then fallen in with many—many more of the same stamp. Birds of a feather, it is said, flock together. How many do you suppose I have met with in my life like-minded with myself, decent fellows, whom I was glad to associate with? Guess! Only five; and one of them was a Frenchman.

Now, Mr Lecturer, are you quite sure it depends on the working-man himself whether he will get on in the world or not? It seems to me that his environment has something to do with the question; and when a man depends on his week's work for his week's means

of existence, he can't always choose what his surrounding shall be. And for keeping you down, there is nothing like your workmates. Talk about being tyrannised over by the aristocracy—crushed with taxes—enslaved by monarchy, and what not; nothing stops the way so surely and fatally as the stupidity, to give it no worse name, of your fellows.

It seems to me, therefore, that whether the working-man shall get on or not, depends on working-men. Even as the proverb says: A man must ask his wife's leave to thrive.

I had heard of a large establishment at the west end, not ten miles from the marble arch, where hundreds of men were employed, and where a reading-room and all that sort of thing was fitted up on the premises for such as chose to make use of it. So I migrated from the east, and got work in what seemed such a promising place; not sorry to quit my ill-conditioned comrades.

By way of change, I took a turn at carpentry, which saved me from being shut up all the time in the workshop. I was employed a good while in some of those handsome rows of houses that link London to Kensington or Paddington; and not a little pleased was I to find myself in a place where good workmanship was the rule. Every man was expected to do his best, and the foremen took care to see that the expectation wasn't balked. I didn't see any deliberate dishonesty while I was under this firm; but I did see a good many things that soon shewed my chance of getting on wasn't much, if any, better here than elsewhere.

I work when I am at work. One day I was hanging shutters in a new house. I took pains, and by the time the foreman came round in the afternoon, had got four pair hung. He approved the workmanship, but said: 'You are too quick for us: two pair a day is quite enough.'

I stared. It was nevertheless true. You were not to do as much as you could—only as much as by custom had come to be considered enough.

No getting on here, thought I, after this specimen of trade morality. The firm who consequently had to pay their hands for dawdling, and the customer or tenant whose pocket suffered in proportion, were not taken into consideration.

And I felt sure there would be no getting on when I saw how many toadies the foreman had, and how pleased he seemed to be with their subservience, and the use he made of it. Nothing like choosing one of yourselves, my mates, if you want to set up a chief who will make you feel what it is to be kept down. The foreman of the department I was in kept a public-house, and if he didn't see you pretty often in his tiptop-parlour in the evenings, you had nothing to expect from him but disfavour. He had two or three grown-up daughters, whom he wished to marry off his hands, and lucky was the carpenter who paid his addresses to any one of them. Tiptop work and tiptop pay always fell to his share.

And then, notwithstanding the high character of the establishment, I found there was room for dishonesty. If a man was going out to lay down carpets, or put up curtains, and so forth, he went to the office for the necessary supply of tacks, nails, screws, &c. Not unfrequently he had twice as many as he wanted, and what he didn't use he kept.

I couldn't take any pains to conciliate the foreman, neither could I turn a penny by selling surplus tacks, &c., to the little ironmongers in the neighbourhood; and so, as I never had the luck to get tiptop wages, I left the model establishment at the end of a year.

Since then, I have been trying to get up a business on my own account. It is uphill work, and not very promising; but I am not obliged to toady anybody, or to associate with blackguardism or dishonesty. I am, in fact, my own journeyman.

I could not go quietly on, however, till I had puffed away the black thoughts that had been gathering upon my mind from the beginning. Now I have done it: I have had out my growl, and there's an end.

A RIDE IN THE FRENCH IMPERIAL MAIL-GIG.

Last summer there appeared in the *Journal* an entertaining account of a journey from Pumps to Springs by her Britannic Majesty's mail-gig, with the ups and downs, and the *dura mala* of the mail-road. Would your readers feel interested in an account of the style in which his Imperial Majesty Louis Napoleon conveys the letters of his loving subjects in this enlightened age?

It was my lot, some few weeks ago, to visit the *terra incognita*, or well-nigh such, once called Armorica, the cradle of our ancestors, now marked on the map of France as Finistère and the Côtes-du-Nord; and as my route lay beyond the line of service of the diligence, no other means of locomotion offered than to travel with the *courier* in the mail-cart.

I confess that the idea of a seven hours' ride by night was not inviting, especially as the distance was only thirty miles. But the saving of time and money being my object, I soon came to terms with the servant of the government; and at nine p.m. was ready in the yard of the Hôtel de France at Guingamp, awaiting the carriage that was to convey the imperial mail-bags to the Ultima Thule of Carhaix.

'Don't be afraid, sir,' was the salutation of a country woman, one Sally Heartel, who does for the English in that locality—'don't be afraid; the mare's only a little "fierce" or so!' This was not encouraging, but not likely to daunt one who had some experience of the Oxford screw.

'L'v'la le monsieur qui va voyager par le casse-cou,' said a *gamin* among the circle of idlers inseparable from a coach-yard all over the world. *Casse-cou*, that is breakneck in English; not a pleasant idea certainly. But there was not much time to deliberate: my bag and coat were whisked out of my hand, and deposited somewhere, and I was ordered to mount.

By the dim light of a stable lantern, I saw two wheels, and a confused jumble of leather, wood, and cords. The machine had no cushions, and but one spring, and every part had been patched and mended, till the original had almost disappeared. Indeed, the vehicle in any part of Europe would be a curious study for the antiquary: so shapeless and ancient, it appeared like a confused heap of wrecks, and waifs, and strays of the antediluvian world. The mare alluded to was an immense raw-boned cart-horse, with a hump like a camel, and so high, that the shafts were lifted up to an angle of 45 degrees to reach the tugs; and the cart hung back more fashionably than agreeably. But I had little time for further inspection; for the mail being deposited in the well, and a piece of broken board laid across for a seat, up we mounted—the jarvey on the near side, and myself on what should have been his seat in any other country. There is a police regulation in French towns, that after dusk every vehicle shall carry a lantern: accordingly, a lantern, or a substitute for it, with an inch of candle, was put into my hand; but as it had no handle, and only one glass unbroken, it required no slight skill to keep it alight, as the mare dashed off at once as soon as we mounted. With this feat of torch-bearing I was sufficiently occupied, till we got clear of the rattling stones and narrow lanes of Guingamp; but it was not long before the regulation inch of tallow burnt out; and the *octroi* being passed, we were left in outer darkness, and I was free to look after my own comfort.

The driver also seemed much at ease, for he dropped his reins, knotted his whip, and set himself to light his first pipe. I ventured to hint that the seat was rather hard, and likely to damage the nether man; but my friend only replied that it never did him any harm. So making the best of it with a great-coat, I settled down, and made no more remonstrance.

Jog, jog, on we laboured, to the music of the rattling ironwork and ungreased wheels, while the old machine lurched, and bumped, and lumbered along over the uneven road. But our worthy *conducteur* finished his pipe, and then composed himself to his first nap, and coolly laid his head on my shoulder to take it easy. This was rather too strong an invasion of rights; so, after shaking him off two or three times, I watched his coming, and as he lurched over to me, I leaned forward, and he pitched backwards with a momentum which nearly sent him over the back of the cart, and, as it was, deposited his *sombrero* in the road. This awoke him for a kilometre or so; and being repeated as often as he tried to establish himself, proved an effectual means of keeping him awake. But he dropped his hat three times, and his whip twice, before we arrived at Callac. Meanwhile, the 'fierce' one had it all her own way, and trotted, walked, or galloped at her own sweet will, tacking up the hills, and artfully easing the weight in descending by grazing the wheel against the bank.

Two hours brought us to the first *posada*, where a branch of withered mistletoe shewed that bad wine needed a bush; the horse stopped spontaneously, and the driver, being on friendly terms with the hostess, entered jauntily, and invited me to follow. The inmates were all in bed—indeed, no Breton peasant sits up beyond eight o'clock—but sundry night-capped heads peeped out of the little cupboards which serve for bedsteads in these parts, and a voice told us to help ourselves to cognac or cassis—the latter a tolerable liqueur, made from black currants. The driver said we must stop twenty minutes to *laisser souffler* the mare; so there was no help for it; but the place was insufferably close—how the natives can sleep in those closets, with only an inch or two of the sliding-door left open, is an impenetrable mystery—and I was glad to get out of the cabin, and exchange for the fresh air of heaven the reek of the tavern, and disappoint the fleas, which were beginning to smell the blood of an Englishman.

Having at length resumed our route, two hours more of up hill and down hill, of lurching and screaming of the rickety old vehicle, and smoking and snoring of the driver, brought us to the poverty-stricken village of Callac, where we were to change—I was going to say horses, but we rejoiced in only one; and this operation occupied another hour. The driver disappeared with the quadruped, and left me in the motionless, and now more tolerable vehicle, to study astronomy. I think he also improved the shining hour, as I judged from his increased incapacity, and an odour of garlic that floated around him when he returned. I may mention, for the benefit of my piscatorial brethren, that the river Hyères, which runs from Callac to Carhaix, is well stocked with trout, and would repay a visit to those who don't mind roughing it. The road, however, became worse after leaving Callac; and the animal that replaced the 'fierce' one being by no means high-mettled, our progress was slow, but not sure.

'Il n'est pas mauvais montant,' quoth the coachman; but 'descendant il ne vaut rien:' and so it proved. The road is all a series of hills; and when we had arrived at the summit of one, the descent was not so easy or pleasant as that is said to be which leads to Avernus. Bucephalus would insist upon subsiding on his hind-quarters, and sliding down two-thirds of the way; and then, aroused by a volley of whip-smacking and verbal insults, he would spring up, and dash down the remaining declivity like the

possessed swine of holy writ. It was one of these escapades that brought our ride and our vehicle to an untimely end.

I was just thinking how beautifully the flush sunrise was gilding the hill-tops, and how fresh the morning air felt, making amends for the miseries of the journey, when we began to descend the worst hill we had yet encountered. We were at the highest point of the great range of the Menè, that runs through Brittany from east to west; and while the sun was lighting up the hill-tops, the valleys were enveloped in the mist-wreaths, with the tall poplars rising spectre-wise from the vapour; and the road seemed to plunge into a vast lake beneath us. It was too steep for our horse to slide down, and our driver urged him recklessly on. As we rushed down the steep and rotten road, I became aware of a sharp turn and a narrow bridge at the bottom, and got my legs loose for a jump. Just in time: for the off-wheel caught the edge of the parapet, and the horse went down with a terrible concussion; and a very complete upset was the consequence.

With a crashing and splintering up of the old car, I found myself flying through the air, and landed on the opposite bank, with his Imperial Majesty's mail-coachman underneath, and the body of the imperial mail-cart above me, some five yards from the rest of the apparatus. Shaking off the wreck, I emerged like a tortoise, and succeeded in kicking up the driver, who seemed desirous of lying where he was, and venting his remaining energy in heathenish or Breton execrations. We then proceeded to extricate the horse from the debris of the cart-harness in which he was struggling. The whole perch or body of the vehicle had dissolved partnership with the wheels; the imperial mail-bags, and my carpet-bag of ordinary life, were reposing side by side in the mud; and the whole affair, when set on its legs, seemed to have been transformed into a costermonger's cart. The next thing to be considered was how to perform the remainder of the journey. The driver was for riding into Carhaix, and sending back a conveyance for me; but this proposition was too indefinite to be entertained. The horse was a long-backed family quadruped, and could easily carry double; and as the cart was a total wreck, the best thing we could do was to take to the long-boat. So, disengaging the animal from the shafts, we disposed of the concern by pushing it out of the road; and then balancing the mail-bags on one side, and my *sac de nuit* on the other of the old horse, we climbed up, and rode the remaining league into Carhaix. I think our entry in this fashion created not a little sensation. It was only five A.M. when we arrived; but being market-day, there were plenty of natives with their horned charges to bid us welcome, and pass their jokes upon our appearance. I was only too thankful to have come off sound, wind and limb; but I suppose there was something mirth-provoking in the tall lean old chestnut ambling over the stones, with so singular, or rather plural, a burden. In front, Sancho Panza, with a huge sombrero and tight canvas pantaloons; and behind him, like Horace's black care, a tall gentleman in subfusc garments, and of sedate appearance, and the leathern bags hanging against the courser's sides—perhaps the natives may be excused for their jokes at our comical entry. But the driver, now metamorphosed into an outrider, brought his bags to the bureau in time; and made light of the breakdown, which one would think he had contrived for my special gratification, *pour amuser l'Anglais*. And the host at Guingamp, when I made my re-appearance at the table d'hôte, made a good story of the Englishman who travelled by the casse-cou, and inquired most kindly after the state of my dorsal and cervical vertebrae.

So there you have a true and particular account of the way the imperial post is *exploited*, as the French say in these parts. And if any of your readers pay this

country a visit, they can doubtless be accommodated with a ride in a casse-cou; and I can only hope they will like it.

AN OLD MAN'S QUESTION.

STRANGE soul of mine, that rose, I know not whence,
Upon my sleeping life and mortal frame,
Like morn's sun o'er the mountains, all aflame,
And large through mists of childish innocence;
Which, year by year with me up-travelling thence
As hour by hour the day-star, madest aspire
My heart, thus interpenetrate with fire
It felt but knew not; spirit mixed with sense,
Wisdom with folly, genius with mere clay—
Soul, thou hast journeyed with me all this way,
Oft hidden, oft beclouded, oft arrayed
In scorching splendours which my earth-life burned,
Yet sunward up to thee my true life turned,
For, dark or clear, 'twas thou my daylight made.

Soul, set aloof in God's infinitude,
And sometimes seeming no more part of me—
This me, worms' heritage—than that sun I see
Is of the earth he has with warmth imbued,
Whence comest thou? whither goest thou?—I, subdued
With awe of my own being, sit me still
Dumb on the summit of this crowned hill,
Whose dry November grasses, rain-bedecked,
Mirror a thousand suns—That sun which was
Light-bearer, passes: as thou soon must pass,
My soul! Art thou afraid? thou who hast trod
A path I know not, from a source to a bourne
Both which I know not—fear'st thou to return
Alone, even as thou camest—alone to God?

PROGRESS OF CALIFORNIA.

In riding through one of her large agricultural valleys, a few weeks since, where so late as 1852 there was scarcely a mile of fence to be seen from one end of it to the other, I saw now continuous grain-fields, of six or eight miles in length, with perhaps a dozen reapers, of the best patent, marching up and down, levelling the tall thick harvest. Comfortable, substantial farmhouses, or neat cottages, stand upon the sites of the little canvas shanties we used to see, and neat, often elegant vehicles, have taken the place of the clumsy coarse wagon of those times. You may travel in summer on all the main roads, from the north to the south, in the best Concord or Troy coaches, and be received, in the more considerable towns, at as good hotels as you will find at corresponding places anywhere in the Union. And even this great material progress is less expressive of the growth of the state than other signs at present visible in her condition.—*Farnham's California.*

ALCOHOL IN WINES.

The Customs Surveyor-generals have been busy collecting information to ascertain what quantity of proof-spirit per cent. is usually contained in port wine, and from an extensive range of trials, they have discovered the minimum to be 26 per cent. The majority of trials shewed from 30 to 36—some few parcels contained 40 per cent.—and (although the latter is bad enough in all conscience) in a few exceptional cases, as much as 55 per cent. has been detected. Those containing more than 33 per cent. are still held under stop, until the pleasure of the Lords of the Treasury can be ascertained. On the 28th of June 1853, a Treasury Minute was issued, under date 28th October 1853, prohibiting all alcoholic liquids from passing into consumption, as wine, which contained more than 33 per cent. of proof-spirit.—*Ridley & Co.'s Monthly Circular.*

GENTEEL ECONOMY.

It would be well for some of the more highly waged of our operative classes to know what is sometimes done, in the way of economical living, by persons whom they regard as their superiors. It often happens that a clergyman, a medical man, a teacher, or some other person of the so-called middle classes, has less income than an artisan. We lately heard of active ministers of the Established Church of England living on eighty pounds a year. We know that there are Episcopalian ministers in Scotland—officiating chiefly amongst the gentry—on similar stipends. Were there an advertisement for instances of surgeons and country schoolmasters not realising over a pound a week, we apprehend there would be an inpouring of answers like a spring-tide in the Severn or the Solway. Yet all of these people live with their families in a style notably more elegant and sightly than do the generality of such of the working-people as enjoy equal or larger incomes. And not only this; but they often contrive to educate their children, and bring them forward in life, in a way never dreamt of by the most highly salaried operatives.

A remarkable instance of this has lately been revealed through a privately printed memoir of Mr Thomas Thomson, advocate—an eminent legal antiquary, and the man to whom the public has been indebted for the arrangement of the national records of Scotland. This gentleman, who was the intimate friend and associate of Jeffrey, Cockburn, and all that set, sprung from a manse in Ayrshire, where the family income was £105 a year. The worthy clergyman not only gave his son Thomas the education required for the Bar, and the means of paying his fees on passing advocate, but reared another son to his own profession; besides whom there were other children to be provided for. How such feats were accomplished on so small means, while all the time the usual hospitalities of a rural parsonage were maintained, surpasses conception; yet we are assured they were performed, and the means were strictly no more than what is here stated; neither did the father of the family leave one shilling of debt.

It will be of no use to try to make out this as a peculiar and rare case, or as depending on conditions which only existed in a past age, for it is notorious that a very considerable proportion of the young men in both parts of the island, entering the legal profession, whether as barristers or solicitors, as well as those destined for the profession of the civil-engineer, and for service in India, are the children of clergymen possessed of incomes inferior to those enjoyed by many

operatives. The present chief-justice of England is one of the sons of such a clergyman; and many others could be pointed to, now occupying distinguished situations in life. It is a marvel of no rare kind, to see an English clergyman sending his son, or sons, to Oxford, for an education, calling, while it lasts, for an outlay equal to the entire annual proceeds of the benefice. In these cases, of course, there must have been a saving during many years in order to meet the requirements of a few.

How is it that persons of small income in the middle classes make such good and laudable results out of their little means? There can rest no doubt that it is done only by great self-denial and frugality. The principle at work is that of Genteel Economy. There are elegant tastes calling for gratification; but they are quietly set aside. There is accomplishment that might adorn the saloons of the affluent; but it is calmly, though perhaps with a sigh, condemned to waste its sweetness on the desert air. Scenes of public gaiety are avoided, because they infer dresses that cannot be afforded. The friend is left uninvited, because the family *ménage* can scarcely shew before a stranger. What is called a very quiet life—that is, a life without the excitement from society which is one of its necessities—is submitted to without a murmur, but not without suffering—sometimes not without positively hurtful consequences. The daily experiences of tradesmen and servants are often of a more enviable kind. Can anything be more affecting than a life in which so much that is needed, and that could be enjoyed, is dispensed with and postponed? We here see men and women to whom the future is more important than the present—to whom the intellectual is of more account than the material, the sentimental than the sensual—persons who, resigning themselves perhaps to a narrow and ungenerous lot, indulge the hope that their offspring will rise to something better, and for the realisation of that hope are willing and ready to make great sacrifices. If to make the future overrule the present, and to subordinate our own gratifications to those of some other person, is to advance in the scale of moral being, great praise is surely due to those who, from such motives, practise a genteel economy. Self-denial in such circumstances truly has in it that religious beauty which is only illusively associated with the self-denial of the ascetic.

Amongst the hand-workers, there is often equal or superior means, but much seldomer the disposition to fashion the ways of a household to the attainment of some postponed benefit. Nor is this wonderful, when we consider that the sense of such benefits is not so apt to be engendered in that class of minds. The intelligent

member of the middle class sees what blessings attend refined life, when supported by sufficiency of means; he strains for those blessings, accordingly, for himself or his children. The artisan is shut out from contact with such things, and so far from hoping for, does not even think of them. Hence the so frequent and so sad spectacle of a *ménage* equally coarse and extravagant, luxury without comfort or refinement, and, what is more painful to look at, indulged in on the very brink of want and dependence. Till the sturdy operative shall be elevated by education and circumstances to higher ideas of what is really worth straining for in life, he will continue to fall far behind the genteel poor in these respects.

The Genteel Poor! name of pity and ridicule to many, a favourite theme of sarcasm among novelists and dramatists ever since modern fiction arose. And yet we do seriously believe that the genteel spirit is often not merely a softener of poverty, but a means of redemption from it. When the educated person of the middle classes is reduced to pennilessness, as often happens in this variable world, what is it that keeps him from sinking into and being lost in the obscure multitude but this spirit? what but this gives him the desire to struggle again up the slippery slope of fortune? A gentleman now in a very distinguished situation in life has assured us, that when he found himself in his youth brought by the misfortunes of his family into association with the humbler class of people, it was alone the *sense of the better sphere of life he had been in* which inspired him with the industry and self-denial by which he has worked his way so far upward. And we can well believe it. It may be called by such names as pride and vanity; but if these names be rightly applied, then we would assume and defend the position, that pride and vanity are things not without their use in our moral economy.

GLIMPSES OF AFFAIRS IN AMERICA.

FLORIDA—TEXAS—FUGITIVE SLAVE-BILL.

SYMPATHISING with the Americans in their unfortunate inheritance of slavery, and making every allowance for the constitutional difficulties which are presumed to surround any plan for its eradication, we must regret the manner in which this portentous evil has not only been suffered but actually stimulated to grow in dimensions. At no period since the foundation of the Union, has the number of slaves diminished; on the contrary, it has regularly increased; and at the period at which our narrative has arrived, 1820, it amounted to 1,538,064.

From the time the Missouri Compromise came under agitation, there was a succession of measures, all tending to extend the sphere of compulsory servitude. The first of these was the annexation of Florida, which did not excite any particular hostility. The peninsula of Florida—swampy, rich in alluvial marshes and savannahs, and eminently suitable for the production of rice and the sugar-cane—possesses a history abounding in picturesque incident. Discovered and settled by the Spaniards; captured by the English; then rendered back to the Spaniards; it ultimately, during the early years of the present century, became an object of desire to the United States—to which, by contiguity, it formed so convenient an appendage, that its fate from the outset could easily have been foretold.

The Americans, as their best friends allow, have never, on suitable occasions, been at a loss to make out a good case of injury, requiring smart reparation. The Floridians were a bad set. They had preyed like freebooters on American commerce, and the sufferers were denied all redress from Spain; they had excited the Indians to molest the frontiers of the states; and, worst of all, they had given refuge to runaway slaves

from Georgia and Louisiana. Such proceedings were intolerable. Pacific overtures having failed, the United States government despatched a military force to overrun Florida. Negotiations followed, in which the Americans advanced a claim to Texas, as having been a portion of the old French province of Louisiana, which the Spaniards ought long since to have relinquished. Spain was thankful to buy off this strange demand, and otherwise adjust the claims against it, by ceding Florida; the United States at the same time undertaking to indemnify citizens for their losses. In virtue of a treaty to this effect, Florida was taken possession of by General Jackson in the summer of 1821. As a territory of the Union, this hapless peninsula endured for some time the horrors of a war levied against the Seminole Indians, with a view to recover fugitive slaves and their descendants. The narrative of this ruthless war of races, aggravated by the use of blood-hounds to trace the Indians and negroes through the brakes and swamps, involves instances of more fearful suffering and daring heroism than perhaps any history of modern times. Finally, the Indians being subdued and removed in a body, and the real or alleged fugitives secured, Florida settled down into the ordinary condition of a state, with slavery as a legalised institution.

The claim on Texas on the above occasion, shewed pretty conclusively that there were parties in the United States who cast a longing eye in that direction. The practice of acquiring new countries and adding them to the Union, began with Louisiana and Florida, and with these precedents, might be carried to any extent. The desire for these territorial acquisitions, though partly owing to the restless character of the Americans, as well as to certain necessities in their position, arose in no small degree from causes connected with slavery. Not to speak of the exhaustion of lands by slave-labour, and the corresponding obligation to seek for fresh scenes of operation, there is an incessant natural increase in the slave population, which leaves to planters no choice between being eaten up by servants and sending them adrift through the agency of the slave-trader. On this account alone, there is positively no limit to the extension of slavery. Unless the surplus be carried off by emancipation—and to that the law in several states presents serious obstacles—there is no restricting it in amount or keeping it within a definite locality. Then, we have the commercial principle giving active impulse to the institution. Slave-breeders and traders rejoice in the prospect of new settlements and new purchasers; and if the matter rested with them, they would be glad to see the Union engulf country after country, till at length there was nothing more to incorporate. To this wild demand for territorial enlargement, the central government, for obvious reasons, can give no external concurrence in the first instance; but that is of little consequence. The condition of affairs in America is at all times favourable to the commission of daring exploits by private adventurers, whose acts can be repudiated or sanctioned as circumstances shall determine. In no country in Europe could be found groups of individuals at all to compare with these adventurers of the true filibuster type. They are the refuse of the world—penniless, reckless, confident, and unscrupulous. Refugee Poles, Italians, and Frenchmen; exiles from the British Islands, bankrupt in character and fortune; Portuguese and Spaniards, with predatory habits acquired in the slave-trade or in freebooting; immigrant Germans, who, instead of pushing off to inland rural settlements, as is usual with their countrymen, have become frequenters of taverns, and copiously indulge in 'lager beer'; sons of American gentlemen, who, brought up without restraint, and having gone through their fortune, loiter about bar-rooms and gaming-houses, get up dog and cock fighting matches, and at

night tormenting the streets as rowdies—all are ready for any sort of mischief. Such are some of the elements of a filibustering expedition, of which, however, the 'white trash' of the south, by whom honest labour is deemed a disgrace, usually form the staple material. Equip, arm, and ship off company after company of this heterogeneous mass—see them land in grotesque costume, their trousers stuffed into dirty boots, their striped or red woollen shirts, their rusty beards, hats of every imaginable shape, belts stuck with bowie-knives and revolvers, and rifles slung over their shoulders—chewing, spitting, swearing—and you have an army of marauders such as, we venture to say, could be nowhere else produced on the face of the earth.

Nature accomplishes great designs by rough agencies. The Old World was not peopled and settled as we now see it, without going through centuries of violence and bloodshed. Greeks, Persians, Romans, Goths, Saxons, Normans, and Sea-kings, all in their turn conquered without justice or mercy. But that was long ago, and one imagines that, under the lights of Christianity and modern civilisation, things should be managed differently. True in one respect, but not in another. Much of the American continent is now going through its ancient and middle ages. Filibusters are the Sea-kings of the nineteenth century. Who is to restrain them, so long as they confine their stealthy attacks to regions under a weak rule, adjoining the southern states, and the annexation of which to the Union flatters the desire for national aggrandisement? If to this we add the ardent demand for new territories over which to disseminate slave-labour, the impulse for acquisition not only becomes irresistible, but, to judge from past events, is almost certain to receive the countenance of the highest federal authorities.

Looking about for means of advancing their interests, slaveholders and slave-traders saw no outlet so available as that westwards along the Gulf of Mexico into Texas. This province, of almost matchless fertility, producing cotton equal to the finest in the United States, extended over twelve degrees of latitude, with an area large enough to form eight or nine ordinary sized states; and it was calculated that, if freely opened to planters and their servants, the value of human stock would probably rise fifty per cent. Ever seeking new spots for settlement, parties of emigrants had begun to find homes in Texas as early as 1819. They were chiefly from the north, and, for the sake of material interests, were fain to submit to the petty tyranny which usually accompanies the Spanish rule. Some years elapsed before there appeared any chance of success for a filibustering expedition. As soon, however, as Mexico had shaken off Spain, and declared itself a republic, things seemed ripe for striking a blow. From this time, 1824-5, we hear of migration into Texas on a formidable scale. It is no longer parties of industrious yeomen who come across the frontier, but companies of armed men, under southern leaders of military reputation. Claiming to have territorial rights under grants from Mexican authorities, there arrive in their train, flocks of greedy speculators and jobbers, holders of scrip in real or pretended joint-stock land companies, besides a floating mass of adventurers anxious to secure whatever good might fall in their way—and when we recollect that there was a country as large as France to be won by dint of a little impudence and fighting, and that the first-comers had the best chance, the rush to Texas is no great matter for surprise. The method of appropriation, however, is curious. It resembles nothing so much as that of a lodger who, taking a fancy to his quarters, begins by finding fault with his landlord, and ends with turning him out of doors. Clearly, the Americans had no business in Texas—not any more than the English had in India—and if they went thither, it was their duty as foreigners to remain quiet. But good order and respect

for rights are, in such cases, against all rule. How the Texan settlers and their allies picked endless quarrels with the wretched government to which the province nominally belonged—how, under General Sam. Houston, the invading host unfurled the standard of rebellion—the significant lone-star—which like a meteor they carried through the country, as far as the banks of the Rio Grande del Norte—how they overpowered the Mexicans, and in one of their battles captured Santa Anna, whom they set at liberty only on having conceded to them the independence of Texas—are all circumstances well known. In short, in the space of two years, by the desultory movements of a body of unauthorised adventurers, an extensive and valuable province was wrested from Mexico. The brilliance of this exploit is somewhat lessened by the fact, that a large army entered Texas, by order of the United States government, professedly to allay Indian disturbances, but really to hang about as a reserve, to countenance, and, if need be, to support, the filibusters. The object of the invasion was never a matter of doubt. It was to secure independence, and then to seek annexation, with a view to strengthening southern interests, by adding several new slaveholding states to the Union. On the character of this splendid manoeuvre, we should prefer allowing an American writer to speak. 'Some crimes by their magnitude,' says Channing, 'have a touch of the sublime; and to this dignity the seizure of Texas by our citizens is entitled. Modern times furnish no example of individual rapine on so grand a scale. It is nothing less than the robbery of a realm. The pirates seize a ship. The colonists and their coadjutors satisfy themselves with nothing short of an empire.' Shrinking from annexation, he adds that this act will be accomplished only at the 'imminent peril' of American 'institutions, union, prosperity, virtue, and peace.'

In the wilful perpetuation and extension of slavery—its infliction on a country from which it was expelled—lies, perhaps, the chief odium of this great deed of spoliation. Although accustomed to look with contempt on Spain and the transatlantic nations which she has planted, we are obliged in the present instance, as an act of simple justice, to state, that when the Mexicans attained to independence, they at the same time loosened the bonds of the slave—decreeing, 'that no person thereafter should be born a slave, or introduced as such into the Mexican states; that slaves then held should receive stipulated wages, and be subject to no punishment but on trial and judgment of the magistrate.' Doubtless, these humane provisions were partly a consequence of the large infusion of mixed breeds and persons of colour in all ranks of Mexican society; but be this as it may, slavery had been abolished in Texas when it fell into the hands of the Americans. After this occurrence, however, slaves were rapidly introduced, and with avowed slavery institutions, the republic claimed to be admitted into the Union. When annexation was formally proposed, there was a considerable division of opinion as to its expediency. Petitions were presented to congress, and Daniel Webster, among other men of note, offered some wholesome oratorical opposition to the measure, on the ground that the admission of so large a region as Texas would give a most undue preponderance to the South. In one of his speeches, he says: 'I frankly avow my entire unwillingness to do anything which shall extend the slavery of the African race on this continent, or add other slaveholding states to the Union. When I say that I regard slavery in itself a great moral, social, and political evil, I only use language which has been adopted by distinguished men, themselves citizens of slaveholding states. I shall do

* Channing's Letter to the Hon. Henry Clay, on the Annexation of Texas. 1837.

nothing, therefore, to favour or encourage its further extension. In my opinion, the people of the United States will not consent to bring a new, vastly extensive, and slaveholding country, large enough for half-a-dozen or a dozen states, into the Union. IN MY OPINION, THEY OUGHT NOT TO CONSENT TO IT. Indeed, I am altogether at a loss to conceive what possible benefit any part of this country can expect to derive from such annexation. All benefit to any part is at least doubtful and uncertain—the objections obvious, plain, and strong. On the general question of slavery, a great portion of the community is already strongly excited. The subject has not only attracted attention as a question of politics, but it has struck a far deeper-toned chord—it has arrested the religious feeling of the country; it has taken a strong hold on the consciences of men. He is a rash man, indeed, and little conversant with human nature, and especially has he a very erroneous estimate of the character of the people of this country, who supposes that a feeling of this kind is to be trifled with or despised. It will assuredly cause itself to be respected.' In conclusion, he said: 'I see, therefore, no political necessity for the annexation of Texas to the Union—no advantages to be derived from it, and objections to it of a strong, and, in my judgment, decisive character. I believe it to be for the interest and happiness of the whole Union to remain as it is, without diminution and without addition.'

Expostulation was useless. By the election of Mr Polk as president, November 1844, the people shewed their desire for annexation. When the subject was debated in congress, a resolution to annex was carried, and Texas was accordingly incorporated as a state in 1845, without any restriction as to slavery. It was provided that four new states of convenient size might afterwards be formed out of it; and further, that slavery, at the discretion of the inhabitants, might exist in all the new states, south of 36° 30' north latitude, commonly known as the Missouri Compromise line.

Out of the annexation of Texas sprang a war, which in its turn produced still greater extensions of the Union. According to Mexican topography, the boundary of Texas on the west was the river Nueces. The Texans, however, insisted that the proper limit was the Rio Grande del Norte; and in 1846, an army of occupation under General Taylor was marched into the disputed region. On this and some other grounds of dispute, a collision with the Mexicans ensued; and for two years subsequently, there raged a war by sea and land with the United States. The result, as might have been expected, was disastrous to the Mexicans, who were no match for the Americans. Under General Scott, the war was prosecuted with consummate skill, and nothing could have been more easy than the conquest of the whole of Mexico, had it been expedient to carry matters that length. By the final terms of adjustment, the United States government paid large sums to Mexico for extensive tracts of country which might have been retained or taken by force. The possessions acquired on this occasion included California, and certain regions in the interior, now composing the territories of New Mexico and Utah—in fact, by these annexations, in conjunction with rights founded on pre-occupation, the dominion of the United States engrossed the entire continent from the Atlantic to the Pacific, and from the British possessions on the north to the shrunken republic of Mexico on the south; and it seemingly became only a question of expediency as to the time when all that remained of Mexico should swell the gigantic proportions of the Union.

To procure a command of money for the purchases from Mexico, a bill of appropriation was laid before congress. Now ensued a long and entangled contest between parties respecting the restriction or non-restriction of slavery in the lands about to be acquired from Mexico; it was, in fact, a resumption of the old

dispute, whether congress had the power to determine the institutions of the territories. The debate in the first instance turned on the motion of Mr David Wilmot of Pennsylvania, usually called the Wilmot proviso, which was to the effect of passing the bill, 'provided neither slavery nor involuntary servitude shall ever exist in any part of the territory to be acquired from Mexico.' This and similar restrictive clauses were lost. In the succeeding congress, 1847, a bill was carried to organise the territory of Oregon, according to the provisions in the ordinance of 1787. This latter point, which insured freedom to the territory, was carried with some difficulty. It may here be added, that the territory of Minnesota was organised, 1849, and that of Washington, 1853, both with free institutions. The northern situation of these territories, we presume, rendered them not very available for slavery.

During the passage of the Oregon bill, an attempt was made by the slaveholding interest to extend the line 36° 30' to the Pacific; but it was defeated. The object of the movement was, in effect, to make a distinct division of the United States into North and South, each with its peculiar institutions. Such a division was felt to be essential to the permanence of slavery; for if, at any subsequent period, free states should be organised on the borders of Texas, they would be a ready refuge for the whole slave population. The defeat of the proposed division, which was a kind of northern triumph, did no more, however, than postpone for a short time the tug of war. Hitherto, while there were plenty of new lands north and south to annex, free and slave states had been added in so equal a proportion, that the numerical balance was kept tolerably even. Now, the unoccupied lands in the north were becoming scarce; many new free states in that direction were hopeless; and if the balance was to be maintained, the North would require to seek for an equipoise south of the line of the Missouri Compromise. The game of pitching new states into the Union was getting serious—the result critical.

Nations, like individuals, usually add more to their cares than their comforts by their acquisitions of property. The United States had from small beginnings become a mighty empire; but while prosperous in its material interests, it was torn with intestine commotions. It had acquired enormously large possessions in the south; but what was to be done with them? Eager discussions respecting these acquisitions occurred in the congress 1849-50. Zachary Taylor, the new president, having recommended the organisation of California as a state, and New Mexico and Utah as territories, of the Union, there arose a contest on that everlasting subject—the imposition of restrictions as to slavery. Once more, Henry Clay interposes to allay the storm with an ingeniously complicated and specious compromise. To understand the purport of this beautiful piece of legislation, it is necessary to have some notion of the state of affairs since 1834. The invasion of Texas, and its probable results in extending slavery, greatly stimulated the party of Abolitionists, who about this time began to agitate with uncommon zeal—perhaps more zeal than discretion—through the agency of speeches, pamphlets, and petitions. One of the things they especially demanded was the expulsion of slavery from the District of Columbia, where it was a scandal to the official capital of the States. So numerous were the petitions presented to congress on this and analogous subjects, that at length the extraordinary resolution to receive no more was adopted, and for several years the very right of petition was so far suspended. It was during this turbulent decade (1830-40), that a bill was brought in to extend the slave state of Missouri. The prescribed boundaries of this state on the west having excluded a triangular district, which remained free soil in virtue of the

ordinance of 1787, the incorporation of it was anxiously desired by the Missourians, for it was exceedingly fertile, and lay on the route to the rich and still unappropriated lands of Kansas. Strange to say, the bill to incorporate this region—legally insured to freedom—was passed in 1836 without any perceptible opposition. The tract so annexed composes six counties, and has become one of the most populous and wealthy sections of the state, devoted to the growing of hemp, tobacco, and other articles, and cultivated by slaves. This, we are told, 'is the most pro-slavery section of the state, in which was originated, and has been principally sustained, that series of inroads into Kansas, corruptions of her ballot-boxes, and outrages on her people, which have earned for their authors the appellation of *border ruffians*.' *

Not discouraged, the ultra anti-slavery party kept up a constant war of argument and remonstrance through the press. The Texan invasion and its consequences imparted fresh energy to the remonstrants. Petitions for a dissolution of the Union, for amendments in the constitution, for a reform of the representation, were poured into congress, and when discussions arose respecting the admission of California, the contest overshadowed all other questions. Clay, as has been said, now comes on the scene, with his plan of conciliation, which, being embodied in several bills, was cleverly carried through congress in August 1850. This famous 'omnibus' measure, as it was called, was worthy of Clay's genius. The South had complaints against the North, on account of the difficulties thrown in the way of recovering fugitive slaves. The North complained that slavery continued to exist in the District of Columbia. Clay projected some mutual concession on these points; and as the South was the more intractable, adjusted its demands by conceding that the inhabitants of the new southern acquisitions should exercise the right of introducing or excluding slavery; further, the original compact with Texas was confirmed, and its western boundary fixed at the Rio Grande del Norte. California was admitted as a state, and New Mexico and Utah as territories, on the basis of 'squatter sovereignty'—a circumstance of no moment, as it proved, to California, which, though already intruded on by some planters and their slaves, made choice of freedom. Slavery was not abolished in Columbia, but the slave-trade and open sales of slaves were prohibited under heavy penalties in the District. Lastly, the Fugitive Slave Bill strengthened those provisions in the federal constitution for recovering runaways, which in many parts of the country had become practically inoperative. These united measures did not become law without incurring opposition on both sides; but we are concerned to observe, that in all the divisions in the legislature, members from free states voted with the South—the only rational explanation of this being, that the principle of freedom *versus* slavery had not attained force sufficiently distinct to overcome party connection or individually selfish considerations. Among the eminent men who on this occasion voted in violation of formerly professed principles, was Daniel Webster—a circumstance of which he was so painfully reminded by his rejection at a convention for proposing candidates for the presidency, that he languished and died 'a damaged man,' October 1852. Clay, a short time before, made an equally abrupt and unlamented exit.

It is now, we believe, generally admitted by its partisans, that Clay's Fugitive Slave Bill was a grave political blunder; for, besides failing in its professed object, it exasperated the North in no ordinary degree, and, more than anything else, has there promoted an unconquerable hatred of slavery and all engaged in its

support. Of the working of this most odious measure, we may afterwards have occasion to speak. Meanwhile, it is enough to say, that it is already as much a dead-letter in several northern states as were the original obligations on which it was founded. So much for Clay's omnibus measure, which was to insure universal harmony! So much for what a committee of congress in 1854, sagaciously proclaimed as having been 'a final settlement of the controversy, and an end of the agitation.' Well may one say, with how little wisdom is the world governed!

With the incentives to increase, to which we have drawn attention, it will not be thought remarkable that in 1850, the number of slaves in the United States had risen to 3,204,313. W. C.

THE SHOE-BLACK BRIGADE.

SOMEWHERE about a year ago, a friend pressed upon my attention what he termed the Shoe-black Brigade of London, and expatiated so long and freely upon the excellency of the institution, upon the good it had effected and was effecting, and the support it deserved from the public, that the desire to inquire further about, nay, rather to look into its operations and to examine its merits, became irresistible. The facts which have come to my knowledge, in the course of this investigation, are of so interesting a nature, that I make bold to lay them before the general reader, feeling assured he will derive the same pleasure from the perusal of the following details that I experienced in collecting them.

The institution is unique in its way: in no part of the world can its like be found. Shoe-brushing establishments, it is true, exist elsewhere: in most French towns of any importance, shops, or rather saloons, are elegantly fitted up with broad easy divans, covered with rich crimson-velvet, running round them, and invariably recognisable by the inscription, printed in large letters over the entrance, *Ici on circe les bottes*. At the corner of every street you may also meet with a *commissionaire*, dressed in a bottle-blue suit of corduroy, with a large tin badge upon his left arm, sitting on or leaning over a box, the inside of which contains his brushes and his *verni*; and, for a couple of sous, you may have your trousers cleansed and an exquisite polish given to your upper leather.

Still, nowhere will you find a company, a guild of shoe-blacks, organised in the same manner, with such high aims, with such generous and philanthropic objects in view. In the one case, the hard necessity of getting a livelihood is the object, and men, not boys, are the operators; in the other, the desire of finding employment for the poor and neglected children of the streets and alleys of our overgrown metropolis, originated the system, and it has subsequently proved a valuable stepping-stone to something better—to something higher. The purpose of the institution is not reformatory; the object of its promoters is rather to keep those under their charge from falling into vicious courses of life, which would certainly lead them to the reformatories, or, if not thither, to the prisons or the galleys. Their motto might well be, 'Prevention is better than cure.'

It appears, that about five or six years ago, a number of gentlemen, principally members of the Temple or Lincoln's Inn, taking a lively interest in the future of the children of those marvellous academies for the hungry and naked, those Samaritan universities for the hitherto poor and neglected—the Ragged Schools—formed themselves into a committee for the purpose of finding out and organising remunerative occupation for the scholars who conducted themselves well, and were desirous of rendering themselves useful. With this view, a company of shoe-blacks, broomers, and messengers was set on foot. The idea of public shoe-

* *History of the Struggle for Slavery Extension or Restriction.* By Horace Greeley. Dix & Edwards, New York, 1856.

blacks was a revived rather than an original one, since, years ago, our forefathers used to enjoy the luxury at the corners of the streets. The opening of the Great Exhibition, however, and the expected influx of visitors from all parts of the world, favoured, if it did not suggest the idea in the present instance, as it seemed to afford a splendid opportunity for employing the children of the Ragged Schools largely to their own profit.

Accordingly, on Monday the 31st of March 1851, five boys were selected, and sent out for the first time to work in the streets. A few weeks sufficed to determine the success of the enterprise. By the end of July, thirty names were enrolled on the books of the committee.

One of the great difficulties, however, the promoters of the scheme had to contend with, was the selection of proper stations for the boys, since the commissioners of police regarded with rather a reluctant eye this innovation, being apprehensive of having their high-ways and by-ways obstructed by a corps of disorderly shoe-blacks; though it did probably occur to them that this corps would be far less troublesome when earning thus a decent livelihood, than afterwards, if allowed to run adrift upon society. The orderly conduct of the boys themselves, however, overcame the scruples of the civic functionaries; special posts were established, and divisions formed, not only with the sanction, but under the protection of the superintendent. The receipts of the first six months, it was found, were larger than they have been since within the same period. This is to be attributed to the great influx of foreigners and country-people flocking to London during these months. But the occasion gave a fair start to the enterprise; and it went on extending its ramifications, until it was found necessary to break up the original society into three distinct bodies, for the better working of the system.

The three societies are—the Original Shoe-black Society, head-quarters Maiden Lane, Covent Garden; the East London Society, head-quarters High Street, Whitechapel; and the South London Society, head-quarters High Street, Borough.

No boy can be admitted into any of these societies except on the recommendation of the superintendent of a Ragged School in connection with the Ragged School Union. The *postulant*, or candidate for employment, must also bring a printed form, properly filled up and signed, stating his name and age; the length of time he has attended school; whether he has at any time been employed in service; whether he has been in prison; whether his parents are living, &c. It should be observed, too, that the committee prefer boys between the ages of twelve and fifteen, since experience has shewn that the disposition is then more tractable, the character more quickly formed, and the boys more willing to undergo the training necessary to fit them for their duties. It is then they begin to understand the utility of the discipline they are subjected to, and can best appreciate the motives which influence their teachers and directors.

When a youth enters, he is first initiated into the mystery of handling the brushes. To give perfection in this branch, only a few days' practice are deemed requisite, and he is then sent forth upon trial, not as one of the elect, but simply as a novice. The term of probation lasts a month, during which time the boy is expected to continue his connection with the school from which he came, and to attend it Sundays as well as week-day evenings as often as he can. To insure regularity in his attendance, he receives a card, on which the superintendent marks the number of times he is present. This card is given up on Monday mornings, and the times of attendance noted down. If the boy, on probation, proves steady, industrious, and skilful in his new occupation, he is regularly admitted, and dons the uniform of the society of which

he is making a member, and is provided with the necessary implements out of the general fund.

The uniform not only enables the superintendent to recognise his protégés, but the public also; so that by thus making the youths conspicuous in the street, it serves as a check upon any irregularity on their part. Much the same sort of plea retains the odd, quaint dress of the times of Edward VI. in Christ's Hospital. The boys of the Original Society are distinguished by a *red jersey* and cap with a *red band*; the East London Brigade by a blue uniform; whilst the boys of the South London Society wear a yellow or canary-coloured jersey, with a cap with a yellow band. Badges, again, are required to indicate each individual of these several corps; consequently, either on their breast or right arm, or sometimes on both, a piece of cloth is sewn, bearing a particular letter or letters, worked in white beads by the children of the Lisson Street Refuge. This institution, whose services are thus made available, was founded in 1850 by a few charitable ladies, who interested themselves greatly in the female branch of the Ragged Schools. Perceiving that, unless the poor girls taught in these establishments were separated from the kind of life they had led and were leading, the good achieved by the schools would be neutralised as they grew older, these kind ladies hired a few rooms, which were fitted up for the boarding and lodging of seven. Since then, however, 150 have been received into this asylum, of whom sixty-six have been provided for, and the rest returned home to their friends. Whilst in the Refuge, they are trained to become useful servants, and taught reading, writing, ciphering, &c., as well as needle-work and straw-bonnet making. There is also another establishment which we must notice *en passant*, in reference to the Ragged Schools' Shoe-black Society. We allude to the Grotto Passage Ragged and Industrial Schools. Here tailoring, shoemaking, mat and rug weaving, box-making, hair-picking, and wood-chopping, are the principal occupations pursued. And it is here that the boxes containing the blacking and the brushes for the shoe-blacks, and the mats on which they kneel, are fabricated, so that one institution aids the other in becoming self-supporting.

It may here be observed, that the boxes and uniforms are regularly deposited at the offices of the different societies, as soon as the day's work is over; and if the lads return home, they return home in the plain suits in which they came, or others left at the offices by charitable persons, for the use of the most ill-clad. After their first equipment, too, the boys have to purchase both their uniforms and implements, but these they obtain at half-price. The object is to relieve the society as far as possible of unnecessary burden, and to render the boys careful in the use of what they have received gratis.

At seven o'clock in the morning, the boys assemble at head-quarters. Prayers and passages from the Scriptures are then read, either by one of the committee or the superintendent. Before the Blue and Yellow Societies had established more central points for assembling, some of the boys came in from great distances—from Malda Hill, Whitechapel, and even from Narrow Street, Ratcliffe—to the offices then in York Place, Strand. One boy, for nearly two years, came every morning from the east end of London, and returned at night; thus walking more than eight miles, besides the distances between the office and his station, which sometimes exceeded two miles. It was with the object of reducing the distances the poor boys had to travel to their head-quarters, that the society was broken up into three divisions. When prayers are concluded, the boys disperse to their different stations, where they remain till the evening. The hour of return, however, varies according to the time of the

year—being four o'clock in winter, and half-past six in summer. During the day, the lads are frequently visited at their posts by the superintendent or his assistant, who observes their conduct, and supplies them with blacking should they want it.

The sum of one penny only is allowed to be asked for brushing the trousers and cleaning the boots; but sometimes more is given—a practice which the committee discontinue, as it is apt to make the lads dissatisfied with their legitimate remuneration. A daily account is kept with each boy, who surrenders into the hands of the superintendent his daily gains, which are thus disposed of: Sixpence is returned as a regular allowance; the remainder is divided into three equal parts, one of which is given to the boy in addition to the sixpence, one retained by the society towards defraying the working-expenses and making the institution self-supporting, and one is deposited in a fund reserved as a bank for the future benefit of the boy. By this regulation, three shillings a week at least is guaranteed to each boy; and should his earnings fall below sixpence a day, the difference is charged to his bank. This, however, rarely happens; for it has been ascertained that, by industry and proper attention, a shoe-black can make on an average two shillings a day; and if his earnings habitually fall below that amount, he is deemed unfit for the employment, and discharged from it. It has also been ascertained that different stations have different values, and further, as a general rule, what the value is. Accordingly, to equalise as much as possible the earnings of the boys, they were not allowed to remain more than three days at the same post. Originally, all the stations were occupied by the lads in succession; but for some time past the stations have been divided into three classes. This arrangement was made with a view of enforcing a better discipline, by introducing the system of promotion. Twelve of the best boys were placed in the first class; fourteen in the second; and the remainder in the third—the third being the lowest class, into which all new-comers entered. In the early part of 1855, however, an important change was effected at the suggestion of the chief-commissioner of the city police. The boys employed within the walls were classed separately, and now work only at stations within the city boundaries. Since then, four classes of stations have been established—the first and second, city; and the first and second, town.

Every week, a list of each boy's earnings is made out and expended in the office of the society to which he belongs. This list is anxiously scanned by each member, as thereby he knows the state of his revenue. As soon as a boy's capital amounts to ten shillings, he is allowed to draw it out to provide himself with good working-clothes, or other things necessary for his comfort; and should he desire afterwards to draw further sums, he can do so, but only with the consent of the committee. The weather and the seasons make considerable difference in the profits of the day. Warm sunny weather, with a few showers, is the most auspicious; a heavy wet day is the least favourable; but a public holiday is the best of all. On the 2d of May 1854, two boys, stationed at the Wellington statue, Royal Exchange, made between them L.1, 1s. 8d., or 10s. 10d. each, the largest sum earned by any boy in one day. The economical principle upon which the banks are conducted enables the more steady boys to realise considerable amounts. According to a report printed two years ago, one lad had the sum of L.7, 18s. 4d. to his credit; whilst another had accumulated no less a sum than L.23, 11s. The latter youth was promoted for his good conduct to the rank of assistant, or, as it is more commonly called, inspector. He has since emigrated to Australia, and in that favoured land realised, doubtless by habits acquired under the care of the society, a large sum of money.

When a lad leaves the service, or rather the protection of the society, the balance in his favour in the bank is paid to the superintendent, to be laid out for his benefit. Many have by this means been apprenticed; some have obtained outfits for emigrating; and some good clothes to enter respectable situations.

The average number of boys employed by the Red Society rose from twenty-four in 1852 to forty-eight in 1856; and their earnings in the last-mentioned year amounted to L.1432, 8s. 7d. The Yellow Society, the youngest branch, has been established only two years; average number of boys, twenty-eight and thirty-two; and aggregate earnings for the two years, L.894, 17s. 4½d. But the Blue Society (East London) possesses a feature in its administration peculiar to itself. 'It goes'—to use the words of a zealous promoter of this branch—'still lower in the scale than the other two; for while they employ only those boys who have homes, we—the Blue—take the houseless and most destitute, cleanse them from their filth and vermin, and so completely change their outward appearance, that their former acquaintance scarcely know them again.' To accomplish this object, and in connection with the society, a Refuge has been fitted up, in which twenty-one boys are clothed, fed, lodged, educated, and taught tailoring, shoe-making, and shoe-blacking. Originally, the boys brought their dinners with them, and even breakfasts, which they ate before leaving head-quarters. But as it was found their appetites returned sharply before evening, the committee provided a refreshment-room on their premises, which was conducted by a matron who received the profit, and bore the risk of the department. Bread and butter, eggs, herrings, pies, oranges, pudding, coffee, and soup were there consumed by the boys after the labours of the day were over. This also kept the so-disposed shoe-blacks from adjourning to neighbouring coffee-shops to supper.

To enter the Refuge above mentioned, a note of recommendation from the superintendent of the Ragged School must always be brought by the candidate for admission, when a colloquy to the following tenor takes place.

'Where do you live?'
'I live nowhere, sir.'
'Where do you sleep?'
'Anywhere, sir.'
'Where are your parents?'
'Dead, sir.'
'How long since?'
'Father about four years, mother one.'
'How have you got your living since?'
'Doing anything, sir.'
'Can you read?'
'A little, sir.'
'How long since you had a shirt on?'
'I don't know, sir.'
'Are you willing to work?'
'Yes, sir.'
'Do you know how to get your living?'
'No, sir.'

But a letter of introduction from the superintendent of a Ragged School is not always essential. Misery and destitution have sometimes been the sole recommendation. 'We have now'—to quote again the gentleman above alluded to—'a very superior lad, who has been respectably brought up, and can read and write well; but who, on account of the loss of both parents, became quite destitute, and was brought to me by our boys in a perishing condition. We expect to make an inspector of him.'

If approved of, the boy is admitted at once, conducted to the dormitory, washed, fed, housed, equipped in the blue uniform, and instructed in the crafts we have already enumerated. Since the formation of the Refuge, 322 boys have been admitted, of whom 169

left it of their own accord, 47 were dismissed as incorrigible, and 106 were reclaimed, of whom several were once reputed thieves. These are important facts; and the committee, in a report recently published, express their belief that it cannot be shewn by any other society that 106 boys have been effectually reclaimed from the streets, and put into the way of obtaining their own living so cheaply—the average cost of each boy being only L.1. A great feature in the society again is, that the boys help to pay the expenses incurred in reclaiming them.

We have now briefly to notice the means adopted to enforce discipline and to carry out this beneficial system of training. It is not to be supposed that this is by any means an easy task; not only great patience but great tact must be employed, in dealing with the variety of characters that are introduced to the managers or superintendents of the societies. Of course, the chief object is to gain the child's affections, and to make him sensible of the obligations he is under to those who thus interest themselves so much in his behalf. He is also shewn how much it is his own interest to co-operate with those who undertake to provide for his future and direct his steps. But this is not altogether sufficient. A regular course of control is necessary, and it has been found that this cannot work without a system of rewards and punishments: *Fines*, for late hours, absence, or other misbehaviour; *Degradation*, from one division to a lower, either permanently or for a limited period; *Suspension* from work for a fixed time. Generally speaking, the boys acquiesce in the justice of their sentence, and willingly submit to its execution. The system of rewards consists in giving *prizes* in money, varying from sixpence to half-a-crown, and amounting in all to ten shillings, presented to the two boys in each division whose monthly earnings have been largest; *medals*, presented to the first boys in the three first divisions; and *promotion*, from a lower to a higher division. The results of this system proved its effectiveness in every respect. So far back as June 1852, Mr M'Gregor, one of the first members of the committee which organised the Original Ragged School Shoe-black Society, when examined before a select committee of the House of Commons on 'criminal and destitute juveniles,' declared it as his conviction, founded on experience, 'that boys could be taken as nuisances from the streets, and as criminals from the jails, and be made useful servants to the public, able to earn an honest livelihood during their reformation, and finally become religious and respectable lads, or leave as useful colonists.' The experience of subsequent years corroborates still more strongly and permanently this report. When further examined on the means employed to achieve this noble object, and the character of the work to which the boys were set, Mr M'Gregor replied, 'that the nature of the occupation was comparatively unimportant, if industry were immediately rewarded, and not merely enforced; if permanent employment were held out in prospect; if good and bad conduct were made directly apparent to the other lads and to the managers; emulation promulgated by classification; honesty, by constant money transactions where trust is involved; economy, by daily saving; attention to respectability of appearance, by enforcing proper clothing; punctuality, by fixed hours; steadiness, by requiring prolonged attention to duties at a certain post; learning, by promoting to stations requiring it; love of home, by providing for those who would be otherwise without a shelter.' It is highly gratifying to our natures to know that youths who, but a year or two since, perhaps but a few months since, were wandering about the streets pilfering and begging, have been so transformed in their conduct and affections; and that of these, a large number support their parents—parents

who probably have entirely neglected them, and through whose immoral and dissipated habits they had themselves been obliged to roam about, aimless, houseless, and breadless.

To shew the special adaptability of the shoe-blackening system to carry out this great work, it is only necessary to give a short account of two employments which we have already alluded to, and which, starting almost contemporaneously with the above society, or rather issuing from it about the same time, ceased shortly after—the Broomers, a name invented for the occasion, and the Messengers. The duty of each broomer was to keep the pavements clean in front of twenty shops. Regent Street, Bond Street, and Waterloo Place, were divided into districts; and on the 10th of November 1851, boys were sent out. By the 12th of January following, twenty-one boys were employed; but from this time their number was gradually reduced, until in the end of March the enterprise was altogether abandoned, it being found insufficiently remunerative; though, we believe, the pecuniary difficulties were not so much the motive for its abandonment as the impossibility of preserving so strict a discipline over the broomers as over the shoe-blacks. In 1852, the other variety of labour was introduced into the working of the society. Four boys were employed as messengers, dressed in blue trousers and scarlet jackets, and provided with a check-book, to enter the addresses of parcels, and to give receipts if required. The sum charged was twopence for the first half-mile, and one penny for every additional half-mile; the boys being stationed at the Bank, the Exchange, and the Electric Telegraph Offices. The committee promoted to this employment the most industrious boys, who had in their banks a sufficient sum to guarantee the value of parcels to the amount of L.3. The Electric Telegraph Company occasionally intrusted the messengers with their dispatches; and one of them was employed by the Crystal Palace Company to distribute their circulars. A respectable publisher also employed four of the society's boys for several weeks in sending out the copies of a new serial. Notwithstanding this patronage, the occupation of a messenger was found to be less remunerative than that of a shoe-black, especially as it was necessary to promote to that office the most active and intelligent of the boys. Towards the close of 1852, therefore, this project was abandoned.

Since that time, the committee have confined the employment of the boys to the ordinary occupation of a shoe-black—with what results, we have endeavoured to shew.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XIV.—LOVE-THOUGHTS.

A DREAD feeling is jealousy, mortified vanity, or whatever you may designate the disappointment of love. I have experienced the sting of shame, the blight of broken fortune, the fear of death itself; yet none of these ever wrung my heart so rudely as the pang of an unreciprocated passion. The former are but transient trials, and their bitterness soon has an end. Jealousy, like the tooth of the serpent, leaves its poison in the sting, and long and slow is the healing of its wound. Well knew he this, that master of the human heart: Iago's prayer was not meant for mockery.

To drown my mortification, I had drunk wine freely at the ball; and on returning home, had continued my potations with the more fiery spirit of 'Catalan.' By this means I gained relief and sleep, but only of short

duration. Long before day, I was awake—awake to the double bitterness of jealousy and shame—awake to both mental and physical pain, for the fumes of the vile stuff I had drunk wrecked my brain, as though they would burst open my skull. An ounce of opium would not have set me to sleep again, and I tossed in my couch like one labouring under delirium.

Of course the incidents of the preceding night were uppermost in my mind. Every scene and action that had occurred, were as plainly before me, as if I was again witnessing them. Every effort to alienate my thoughts, and fix them upon some other theme, proved vain and idle; they ever returned to the same circle of reflections, in the centre of which was Isolina de Vargas! I thought of all that had passed, of all she had said. I remembered every word. How bitterly I remembered that scornful laugh!—how bitterly that sarcastic smile, when the double mask was removed!

The very remembrance of her beauty pained me! It was now to me as to Tantalus the crystal waters, never to be tasted. Before, I had formed hopes, had indulged in prospective dreams: the masquerade adventure had dissipated them. I no longer hoped, no longer permitted myself to dream of pleasant times to come: I felt that I was scorned.

This feeling produced a momentary revulsion in my thoughts. There were moments when I hated her, and vengeful impulses careered across my soul.

These were fleeting moments: again before me rose that lovely form, that proud grand spirit, in the full entirety of its power, and again my soul became absorbed in admiration, and yielded itself to its hopeless passion. It was far from being my first love, and, thus experienced, I could reason upon it. I felt certain it was to be the strongest and stormiest of my life.

I know of three loves distinct in kind and power. First, when the passion is reciprocated—when the heart of the beloved yields back thought for thought, and throb for throb, without one reserved pulsation. This is bliss upon earth—not always long-lived—ending perchance in a species of sublimated friendship. To have is no longer to desire.

The second is love entirely unrequited—love that never knew word or smile of encouragement, no soft whisper to fan it into flame, no ray of hope to feed upon. Such dies of inanition, the sooner that its object is out of the way, and absence will conquer it in time.

The third is the love that 'dotes yet doubts,' that doubts but never dies—no, never. The jealousy that pains, only sustains it; it lives on, now happy in the honeyed conviction of triumph, now smarting under real or fancied scorn—on, on, so long as its object is accessible to sight or hearing! No matter how worthless that object may be or become—no matter how lost or fallen: love regards not this. It has nought to do with the moral part of our nature. Beauty is the shrine of its worship, and beauty is not morality.

In my own mind, I am conscious of three elements or classes of feeling: the *moral*, the *intellectual*, and what I may term the *passional*—the last as distinct from either of the other two as oil from spirits or water. To the last belongs love, which, I repeat again, has no sympathy with the moral feelings of our nature, but, alas! as one might almost believe, with their opposite. Even a plain but wicked coquette will captivate more hearts than a beautiful saint, and the brilliant murderess, ere now, has made conquests at the very foot of the scaffold!

It pains me to pronounce these convictions, derived as they are from experience. There is as little gain as pleasure in so doing, but popularity must be sacrificed at the shrine of truth. For the sake of effect, I shall not play false with philosophy.

Tough ranger as I was, I had studied psychology sufficiently to understand these truths, and I endeavored

to analyse my passion for this girl or woman—to discover *why* I loved her. Her physical beauty was of the highest order, and that no doubt was an element; but it was not all. Had I merely looked upon this beauty under ordinary circumstances—that is, without coming in contact with the spirit that animated it—I might have loved her, or I might not. It was the spirit, then, that had won me, though not alone. The same gem in a less brilliant setting might have failed to draw my admiration. I was the captive both of the spirit and the form. Soul and body had co-operated in producing my passion, and this may account for its suddenness and profundity. Why I loved her person, I knew—I was not ignorant of the laws of beauty—but why the spirit, I knew not. Certainly not from any idea I had formed of her high moral qualities; I had no evidence of these. Of her courage, even to daring, I had proof; of energy and determined will; of the power of thought, quick and versatile; but these are not *moral* qualities, they are not even *feminine*! True, she wept over her slain steed. Humanity? I have known a hardened *lorette* weep bitter tears for her tortoise-shell cat. She refused to take from me my horse. Generosity? She had a thousand within sight. Alas! in thus reviewing all that had passed between myself and the beautiful Isolina, in search of her moral qualities, I met with but little success!

Mystery of our nature! I loved her not the less! And yet my passion was pure, and I do not believe that my heart was wicked. Mystery of our nature! He who reads all hearts alone can solve thee!

I loved without reason; but I loved now without hope. Hope I had before that night. Her glance through the turrets—her note—its contents—a word or two at other times, had inspired me with hopes, however faint they were. The incident in the ball-room had crushed them.

Jurra's dark face kept lowering before me; even in my visions he was always by her side. What was between the two? Perhaps a nearer relationship than that of cousin? Perhaps they were affianced? Married?

The thought maddened me.

I could rest upon my couch no longer. I rose and sought the open air; I climbed to the azotea, and paced it to and fro, as the tiger walks his cage. My thoughts were wild, and my movements without method. To add to the bitterness of my reflections, I now discovered that I had sustained a loss—not in property, but something that annoyed me still more. I had lost the order and its enclosure—the note of Don Ramon. I had dropped them on the day in which they were received, and I believed in the patio of the hacienda, where they must have been picked up at once. If by Don Ramon himself, then all was well; but if they had fallen into the hands of some of the leathern-clad herdsmen, ill affected to Don Ramon, it might be an awkward affair for that gentleman—indeed for myself. Such negligence would scarcely be overlooked at head-quarters; and I had ill-forebodings about the result. It was one of my soul's darkest hours.

From its very darkness I might have known that light was near, for the proverb is equally true in the moral as in the material world. Light was near.

CHAPTER XV.

AN ODD EPISTLE.

Breakfast I hardly tasted. A *tazo* of chocolate and a small sugared cake—the *desayuna* of every Mexican—were brought, and these served me for breakfast. A glass of cognac and a Havanna were more to the purpose, and helped to stay the wild trembling of my nerves. Fortunately, there was no duty to perform, else I could ill have attended to it. I remained as the

azotes till near mid-day. The storm raging within prevented me from taking note of what was passing around. The scenes in the plaza, the rangers and their steeds, the 'greasers' in their striped blankets, the *Indias* squatted on their *petates*, the pretty *poblanas*, were all unnoticed by me. At intervals, my eyes rested upon the walls of the distant dwelling; it was not so distant but that a human form could have been distinguished upon its roof, had one been there. There was none, and twenty, ay, fifty times, did I turn away my disappointed gaze.

About noon, the sergeant of the guard reported that a Mexican wished to speak with me: mechanically, I gave orders for the man to be sent up; but it was not until he appeared before me that I thought of what I was doing.

The presence of the Mexican at once roused me from my unpleasant reverie. I recognised him as one of the *vaqueros* of Don Ramon de Vargas—the same I had seen on the plain during my first interview with Isolina.

There was something in his manner that betokened him a messenger. A folded note, which he drew from under his jerkin—after having glanced around to see whether he was noticed—confirmed my observation.

I took the note. There was no superscription, nor did I stay to look for one. My fingers trembled as I tore open the seal. As my eye rested on the writing and recognised it, my heart throbbled so as almost to choke my utterance. I muttered some directions to the messenger; and to conceal my emotion from him, I turned away and proceeded to the furthest corner of the azotes before reading the note. I called back to the man to go below, and wait for an answer; and, then relieved of his presence, I read as follows:

‘July 18—

‘*Gallant capitan!* allow me to bid you a *buenas dias*, for I presume that, after the fatigues of last night, it is but morning with you yet. Did you dream of your sable belle? “Poor devil!” Ha, ha, ha! *Gallant capitan!*’

I was provoked at this mode of address, for the ‘*gallant*’ was rendered emphatic by underlining. It was a letter to taunt me for my ill behaviour. I felt inclined to fling it down, but my eye wandering over the paper, caught some words that induced me to read on.

‘*Gallant capitan!* I had a favourite mare. How fond I was of that creature you may understand, who are afflicted by a similar affection for the noble Moro. In an evil hour, your aim, too true, alas! robbed me of my favourite, but you offered to repay me by *robbing* yourself, for well know I that the black is to you the *dearest object upon earth*. Indeed, were I the lady of your love, I should ill brook such a divided affection! Well, *mio capitan*, I understood the generous sacrifice you would have made, and forbade it; but I know you are desirous of cancelling your debt. It is in your power to do so. Listen!’

Some *hard* conditions I anticipated would follow; I recked not of that. There was no sacrifice I was not ready to make. I would have dared any deed, however wild, to have won that proud heart, to have inoculated it with the pain that was wringing my own. I read on:

‘There is a horse, famed in these parts as the “white steed of the prairies” (*el caballo blanco de los llanos*). He is a wild-horse, of course; snow-white in colour, beautiful in form, swift as the swallow— But why need I describe to you the “white steed of the prairies?” you are a Tejano, and must have heard of him ere this? Well, *mio capitan*, I have long had a desire—a frantic one, let me add—to possess this horse. I have offered rewards to hunters—to our own *vaqueros*, for he sometimes appears upon our plains—but to no purpose. Not one of them can capture.

though they have often seen and chased him. Some say that he *cannot be taken*, that he is so fleet as to gallop, or rather *glide* out of sight in a glance, and that, too, on the open prairie! There are those who assert that he is a phantom, an *demonio*! Surely so beautiful a creature cannot be the devil? Besides, I have always heard—and, if I recollect aright, some one said so last night—that the devil was *black*. “Poor devil!” Ha, ha, ha!’

I rather welcomed this allusion to my misconduct of the preceding night, for I began to feel easier under the perception that the whole affair was thus treated in jest, instead of the anger and scorn I had anticipated. With pleasanter presentiments I read on:

‘To the point, *mio capitan*. There are some incredulous people who believe the white steed of the prairies to be a myth, and deny his existence altogether. *Carrambo!* I know that he *does* exist, and, what is more to my present purpose, he is—or *was*, but two hours ago—within ten miles of where I am writing this note! One of our *vaqueros* saw him near the banks of a beautiful arroyo river, which I know to be his favourite ground. For reasons known to me, the *vaquero* did not either chase or molest him; but in breathless haste brought me the news.

‘Now, *capitan*, gallant and grand! there is but one who can capture this famed horse, and that is your puissant self. Ah! *you have made captive what was once as wild and free*. Yes! you can do it—you and Moro!’

‘Bring me the white steed of the prairies! I shall cease to grieve for poor Lola. I shall forgive you that *contratiempo*. I shall forgive all—even your rudeness to my double mask. Ha, ha, ha! Bring me the white steed! the white steed!’

ISOLINA.’

As I finished reading this singular epistle, a thrill of pleasure ran through my veins. I dwelt not on the oddness of its contents, thoroughly characteristic of the writer. Its meaning was clear enough.

I had heard of the white horse of the prairies—what hunter or trapper, trader or traveller, throughout all the wide borders of prairie-land, has not? Many a romantic story of him had I listened to around the blazing camp-fire—many a tale of German-like *diablerie*, in which the white horse played hero. For nearly a century has he figured in the legends of the prairie ‘*mariner*’—a counterpart to the Flying Dutchman—the ‘phantom-ship’ of the fore-castle. Like this, too, ubiquitous—seen to-day scouring the sandy plains of the Platte, to-morrow bounding over the broad llanos of Texas, a thousand miles to the southward!

That there existed a white stallion of great speed and splendid proportions—that there were twenty, perhaps a hundred such—among the countless herds of wild-horses that roam over the great plains, I did not for a moment doubt. I myself had seen and chased more than one that might have been termed ‘a magnificent animal,’ and that no ordinary horse could overtake; but the one known as the ‘white steed of the prairies’ had a peculiar marking, that distinguished him from all the rest—*his ears were black!*—only his ears, and these were of the deep colour of ebony. The rest of his body, mane and tail, was white as fresh-fallen snow.

It was to this singular and mysterious animal that the letter pointed; it was the black-eared steed I was called upon to capture. “The contents of the note were specific and plain. One expression alone puzzled me: ‘*You have made captive what was once as wild and free*.’ What? I asked myself. I scarce dared to give credence to the answer that leaped like an exulting echo from out my heart!

There was a postscript, of course; but this contained only ‘*business*.’ It gave minutest details as to when, how, and where the white horse had been seen. and

stated that the bearer of the note—the vaquero who had seen him—would act as my guide.

I pondered not long upon the strange request. Its fulfillment promised to recover me the position, which but a moment before I had looked upon as lost for ever. I at once resolved upon the undertaking.

'Yes, lovely Isolina! if horse and man can do it, ere another sun sets, you shall be mistress of the white steed of the prairies!'

CHAPTER XVI.

THE MANADA.

In half an hour after, with the vaquero for my guide, I rode quietly out of the rancheria. A dozen rangers followed close behind; and having crossed the river at a ford nearly opposite the village, we struck off into the *chapparal* on the opposite side.

The men whom I had chosen to accompany me were all old hunters, fellows who could 'trail' and 'crease' with accurate aim. I had confidence in their skill, and, aided by them, I had great hopes we should find the game we were in search of. My hopes, however, would not have been so sanguine but for another circumstance. It was this: Our guide had informed me, that when he saw the white steed, the latter was in company with a large drove of mares—a *manada*—doubtless his harem. He would not be likely to separate from them, and even if these had since left the ground, they could be the more easily 'trailed,' in consequence of their numbers. Indeed, but for this prospect, our wild-horse hunt would have partaken largely of the character of a 'wild-geese chase.' The steed, by all accounts of him, might have been seen upon one arroyo to-day, and by the banks of some other stream, a hundred miles off, on the morrow. The presence of his *manada* offered some guarantee, that he might still be near the ground where the vaquero had marked him. Once found, I trusted to the swiftness of my horse, and my own skill in the use of the lazo.

As we rode along, I revealed to my following the purposes of the expedition. All of them knew the white steed by fame; one or two averred they had seen him in their prairie wanderings. The whole party were delighted at the idea of such a 'scout,' and exhibited as much excitement as if I was leading them to a skirmish with guerilleros!

The country through which we passed was at first a dense *chapparal*, consisting of the various thorny shrubs and plants for which this part of Mexico is so celebrated. The greater proportion belonged to the family of *leguminosae*—*robinias*, *gleditschias*, and the Texan *acacias* of more than one species, there known as *mezquite*. Aloes, too, formed part of the undergrowth, to the no small annoyance of the traveller—the wild species known as the *lechuguilla*, or pits-plait, whose core is cooked for food, whose fibrous leaves serve for the manufacture of thread, cordage, or cloth—while its sap yields by distillation the fiery *mezcal*. Here and there, a tree yucca grew by the way, its fascicles of rigid leaves reminding one of the plumed heads of Indian warriors. Some I saw with edible fruits growing in clusters, like bunches of bananas. Several species are there of these fruit-bearing yucas in the region of the Rio Grande, as yet unknown to the scientific botanist. I observed also the *salmilla*, or soap-plant, another yucca whose roots yield an excellent substitute for soap; and various forms of cactus—never out of sight on Mexican soil—grew thickly around, a characteristic feature of the landscape. Plants of humbler stature covered the surface, among which the syngenesists predominated; while the fetid *artemisia*, and the still more disagreeably odorous cressote plant (*Larrea Mexicana*), grew upon spots that were sandy and arid. Plesanter objects to the eye were the scarlet panicles of the

Fouquiera splendens, then undescribed by botanists, and yet to become a favourite of the arboretums. I was in no mood for botanising at the time, but I well remember how I admired this elegant species—its tall culm-like stems, surmounted by panicles of brilliant flowers, rising high above the level of the surrounding thicket, like banners above a host. Not that I possess the refined taste of a lover of flowers, and much less then; but cold must be the heart that could look upon the floral beauty of Mexico without remembering some portion of its charms. Even the *rusted* of my followers could not otherwise than admire; and once or twice, as we journeyed along, I could hear them give utterance to that fine epithet of the heart's desire, 'Beautiful!'

As we advanced, the aspect changed. The surface became freer of jungle; a succession of glade and thicket; in short, a 'mezquite prairie.' Still advancing, the 'openings' became larger, while the timbered surface diminished in extent, and now and then the glades joined each other without interruption.

We had ridden nearly ten miles without drawing bridle, when our guide struck upon the trail of the *manada*. Several of the old hunters, without dismounting, pronounced the tracks to be those of wild mares, which they easily distinguished from horse tracks. Their judgment proved correct; for following the trail but a short distance further, we came full in sight of the drove, which the vaquero confidently pronounced was the *manada* we were in search of!

So far our success equalled our expectations; but to get sight of a *caballada* of wild-horses, and to capture its swiftest steed, are two things of very unequal difficulty. This fact my anxiously beating heart and quickly throbbing pulse revealed to me at the moment. It would be difficult to describe the mingled feelings of anxious doubt and joyous hope that passed through my mind, as from afar off I gazed upon that shy herd, still unconscious of our approach.

The prairie upon which the mares were browsing was more than a mile in width, and, like those we had been passing through, it was surrounded by the low *chapparal* forest, although there were avenues that communicated with other openings of a similar kind. Near its centre was the *manada*. Some of the mares were quietly browsing upon the grass, while others were frisking and playing about, now rearing up as if in combat, now rushing in wild gallop, their tossed manes and full tails flung loosely upon the wind. Even in the distance we could trace the full rounded development of their bodies, and their smooth coats, glistening under the sun, denoted their fair condition. They were of all colours known to the horse, for in this race of the Spanish horse is somewhat peculiar. There were bays, and blacks, and whites—the last being most numerous. There were grays, both iron and roan, and duns with white manes and tails, and some of a mole colour, and not a few of the kind known in Mexico as *piebaldos* (piebalds)—for spotted horses are not uncommon among the mustangs—all of course with full manes and tails, since the mutilating shears of the jockey had never curtailed their flowing glories.

But where was the lord of this splendid harem?—where the steed? This was the thought that was uppermost in the mind of all, the question upon every tongue. Our eyes wandered over the herd, now here, now there. White horses there were, numbers of them, but it needed but a glance to tell that the 'steed of the prairies' was not there.

We eyed each other with looks of disappointment. Even my companions felt that; but a far more bitter feeling was growing upon me as I gazed upon the leaderless troop. Could I have captured and carried back the whole drove, the present would not have purchased one smile from Isolina. The steed was not among them!

He might still be in the neighbourhood; or had he

forsaken the manada altogether, and gone far away over the wide prairie in search of new conquests? The vaquero believed he was not far off. I had faith in this man's opinion, who, having passed his life in the observation of wild and half-wild horses, had a perfect knowledge of their habits. There was hope then. The steed might be near; perhaps lying down in the shade of the thicket; perhaps with a portion of the manada or some favourite in one of the adjacent glades. If so, our guide assured us we should soon have him in view. He would soon bring the steed upon the ground.

How? Simply by startling the mares, whose neigh of alarm would be heard from afar.

The plan seemed feasible enough; but it was advisable that we should surround the manada before attempting to disturb them, else they might gallop off in the opposite direction before any of us could get near. Without delay, we proceeded to effect the 'surround.'

The chapparal aided us by concealing our movements; and in half an hour we had deployed around the prairie.

The drove still browsed and played. They had no suspicion that a cordon of hunters was being formed around them, else they would have long since galloped away. Of all wild creatures, the shiest is the wild-horse; the deer, the antelope, and buffalo are far less fearful of the approach of man. The mustang seems to understand the doom that awaits him in captivity. One could almost fancy that the runaways from the settlements—occasionally seen amongst them—had poured into their ears the tale of their hardship and long endurance.

I had myself ridden to the opposite side of the prairie, in order to be certain when the circle was complete. I was now alone, having dropped my companions at intervals along the margin of the timber. I had brought with me the bugle, with a note or two of which I intended to give the alarm to the mares. I had placed myself in a clump of mezquite trees, and was about raising the horn to my lips, when a shrill scream from behind caused me to bring down the instrument, and turn suddenly in my seat. For a moment, I was in doubt as to what could have produced such a singular utterance, when a second time it fell on my ear, and I then recognised it. It was the neigh of the prairie stallion!

Near me was a break in the thicket, a sort of avenue leading out into another prairie. In this I could hear the hoof-stroke of a horse going at a gallop. As fast as the underwood would allow, I pressed forward and came out upon the edge of the open ground; but the sun, low down, flashed in my eyes, and I could see no object distinctly. The tread of the hoofs and the shrill neighing still rang in my ears. Presently, the dazzling light no longer quite blinded me; I shaded my eyes with my hand, and could perceive the form of a noble steed stretching in full gallop down the avenue, and coming in the direction of the manada. Half-a-dozen springs brought him opposite; the beam was no longer in my eyes; and as he galloped past, I saw before me the 'white steed of the prairies.' There was no mistaking the marks of that splendid creature: there was the snow-white body, the ears of jetty blackness, the blue muzzle, the red projected nostril, the broad oval quarters, the rounded and symmetric limbs—all the points of an incomparable steed!

Like an arrow, he shot past. He did not arrest his pace for an instant, but galloped on in a direct line for the drove.

The mares had answered his first signal with a responsive neigh; and tossing up their heads, the whole manada was instantly in motion. In a few seconds, they stood at rest again, *formed in line*—as exact as could have been done by a troop of cavalry—

and fronted their leader as he galloped up. Indeed, standing as they were, with their heads high in air, it was easy to fancy them mounted men in the array of battle; and often have the wild-horses been mistaken for such by the prairie traveller!

Concealment or stratagem could no longer avail; the chase was fairly up. Speed and the lazo must now decide the result; and with this conviction, I gave Moro the spur, and bounded into the open plain. The neighing of the steed had signaled my companions, who shot almost simultaneously out of the timber, and spurred towards the drove, yelling as they came.

I had no eyes for aught but the white steed, and after him I directed myself. On nearing the line of mares, he halted in his wild gallop, twice reared his body upward, as if to reconnoitre the ground; and then, uttering another of his shrill screams, broke off in a direct line towards the edge of the prairie. A wide avenue leading out in that direction seemed to have guided his instincts. The manada followed, at first galloping in line; but this was soon broken, as the swifter individuals passed ahead of the others, and the drove became strung out upon the prairie.

Through the opening now swept the chase—the pursuers keenly plying the spur, the pursued straining every muscle to escape.

CHAPTER XVII.

THE HUNT OF THE WILD-HORSE.

My gallant horse soon gave proof of his superior qualities. One after another of my companions was passed; and as we cleared the avenue and entered a second prairie, I found myself mixing with the hindmost of the wild mares. Pretty creatures some of them were; and upon any other occasion, I should have been tempted to fling a lazo over one of them, which I might easily have done. Then I only thought of getting them out of the way, as they were hindering my onward gallop. Before we had quite crossed the second prairie, I had forged into the front rank, and the mares, seeing I had headed them, broke to the right and left, and scattered away. All were now behind me, all but the white steed; he alone kept the course, at intervals uttering that same shrill neigh, as if to tantalise and lure me on. He was yet far in advance, and apparently running *at his ease*!

The horse I bestrode needed neither spur nor guidance; he saw before him the object of the chase, and he divined the will of his rider. I felt him rising under me like a sea-wave. His hoofs struck the turf without impinging upon it. At each fresh spring, he came up with elastic rebound, while his flanks heaved with the conscious possession of power.

Before the second prairie was crossed, he had gained considerably upon the white steed; but to my chagrin, I now saw the latter dash right into the thicket.

I found a path, and followed. My ear served to guide me, for the branches cracked as the wild-horse broke through. Now and then I caught glimpses of his white body, glancing among the green leaves.

Apprehensive of losing him, I rode recklessly after, now breasting the thicket, now tracing its labyrinthine aisles. I heeded not the thorny mimosaes; my horse heeded them not; but large trees of the false acacia (*robinia*) stood thickly in the way, and their horizontal branches hindered me. Often was I obliged to bend flat to the saddle, in order to pass under them. All this was in favour of the pursued, and against the pursuer.

I longed for the open prairie, and to my relief it at length appeared, not yet quite treeless, but studded with timber 'islands.' Amid these the white steed was sailing off; but in passing through the thicket, he had gained ground, and was now a long way in advance of me. He was making for the open plain that lay

beyond, and this shewed that it was his habit to trust to his heels for safety. Perhaps, with such a pursuer, he would have been safer to have kept the chapparral; but that remained to be seen.

In ten minutes' time, we had passed through the timber islands, and now the prairie—the grand, limitless prairie—stretched before us, far beyond the reach of vision.

On goes the chase over its grassy level—on till the trees are no longer behind us, and the eye sees nought but the green savannah, and the blue canopy arching over it—on, across the centre of that vast circle which has for its boundary the whole horizon!

The rangers, lost in the mazes of the chapparral, have long since fallen off; the mustangs have gone back; on all that wide plain, but two objects appear—the snow-white form of the flying steed, and the dark horseman that follows!

It is a long wild ride, a cruel gallop for my matchless Moro. Ten miles of the prairie have we passed—more than that—and as yet I have neither used whip nor spur. The brave steed needs no such prompting; he, too, has his interest in the chase—the ambition not to be outrun. My motive is different: I think only of the smiles of a woman; but such motive ere now has led to the loss of a crown or the conquest of a world. On, Moro! on! you must overtake him or die!

There is no longer an obstacle. He cannot hide from us here. The plain, with its sward of short grass, is level and smooth as the sleeping ocean; not an object intrudes upon the sight. He cannot conceal himself anywhere. There is still an hour of sunlight; he cannot hide from us in the darkness: ere that comes down, he shall be our captive. On, Moro! on!

On we glide in silence. The steed has ceased to utter his taunting neigh; he has lost confidence in his speed; he now runs in dread. Never before has he been so sorely pressed. He runs in silence, and so, too, his pursuer. Not a sound is heard but the stroke of the galloping hoofs—an impressive silence, that betokens the earnestness of the chase.

Less than two hundred yards separate us; I feel certain of victory. A touch of the spur would now bring Moro within range; it is time to put an end to this desperate ride. Now, brave Moro, another stretch, and you shall have rest!

I look to my lazo; it hangs coiled over the horn of my saddle: one end is fast to a ring and staple firmly riveted in the tree-wood. Is the loop clear and free? It is. The coil—is it straight? Yes; all as it should be.

I lift the coil, and rest it lightly over my bridle arm; I separate the noose, and hold it in my right hand. I am ready—*God of Heaven! the steed?*

It was a wild exclamation, but it was drawn from me by no common cause. In arranging my lazo, I had taken my eyes from the chase, only for a moment: when I looked out again, the horse had disappeared!

With a mechanical movement I drew bridle, almost wrenching my horse upon his haunches; indeed, the animal had half halted of his own accord, and with a low whimper seemed to express terror. What could it mean? Where was the wild-horse?

I wheeled round, and round again, scanning the prairie on every side—though a single glance might have served. The plain, as already described, was level as a table; the horizon bounded the view: there was neither rock nor tree, nor bush nor weeds, nor even long grass. The sward was of the kind known upon the prairies as 'buffalo-grass' (*Sesleria dactyloides*), short when full grown, but then rising scarcely two inches above the soil. A serpent could hardly have found concealment under it, but a horse—*Merciful heaven! where was the steed?*

An indefinable feeling of awe crept over me: I trembled; I felt my horse trembling between my thighs. He was covered with foam and sweat; so was I—the effects of the hard ride: but the cold perspiration of terror was fast coming upon me. The mystery was heavy and appalling!

THE MONTH:

SCIENCE AND ARTS.

FROM certain experiments recently made by Mr W. R. Grove, whose name is associated with the best of galvanic batteries, the way appears to be opening for new applications of electricity, and for investigations rich in promise alike to science and art. It was known years ago to some of the German savans, that a coin or medal placed on a smooth vitreous or metallic surface and electrised, would leave impressions on that surface which became visible when breathed on. From the latter peculiarity they were called 'roric figures'; and attempts were made to fix them by exposure to vapour of mercury or iodine, but without success. Where the Germans failed, Mr Grove has succeeded: 'believing, as I have for many years,' he says, 'that electricity is nothing else than motion or change in matter, a force and not a fluid, I have made experiments to ascertain whether similar effects take place in cases where electrical light is visible upon insulated surfaces only.'

We give a brief sketch of the experiments, adopting Mr Grove's description where it suits our purpose. Two plates of window-glass, about three inches square, were dipped in nitric acid, then washed, and dried with a clean silk handkerchief, and coated on the outside with pieces of tinfoil a little smaller than the glass. A piece of a printed hand-bill was laid between the plates thus prepared; the tinfoil coatings were connected with the secondary terminals of a Ruhmkorff's coil, and removed after a few minutes' electrification. Now, 'the interior surface of the glass when breathed on, shewed with great beauty the printed words which had been opposite it, these appearing as though etched on the glass, or having a frosted appearance; even the fibres of the paper were beautifully brought out by the breath, but nothing beyond the margin of the tinfoil.' These impressions were fixed by holding them over hydrofluoric acid—powdered fluor spar and sulphuric acid slightly warmed in a leaden dish.

'I now cut out of thin white letter-paper,' proceeds Mr Grove, 'the word VOLTA, and placed it between the plates of glass. They were submitted to electrification as before, and the interior surface of one of them, without the paper letters, was subsequently exposed in the hydrofluoric acid vapour; the previously invisible figures came out perfectly, and formed a permanent and perfectly accurate etching of the word VOLTA, as complete as if it had been done in the usual mode by an etching ground. This, of course, could be washed and rubbed to any extent without alteration; and the results I have obtained give every promise for those who may pursue this as an art, of producing very beautiful effects, enabling Silhouette designs, or even fine engravings, to be copied on glass, &c.'

We cite yet another experiment, as it brings photography into play. A plate on which the invisible image was impressed, was immersed in a bath of nitrate of silver, in the usual manner as for a photograph. 'It was then held opposite a window for a few seconds, and taken back into the darkened room; and on pouring over it a solution of pyrogallie acid, the word VOLTA, and the border of the glass beyond the limits of the tinfoil, were darkened, and came out with perfect distinctness, the other parts of the glass having been, as it were, protected by electrification from the action of light. The figures were permanently fixed

by a strong solution of hyposulphate of soda.'—Mr Grove has published an account of his various experiments in the *Philosophical Magazine*.

Professor Hansen of Seeborg, one of the foreign members of the Royal Society, and a renowned astronomer, has recently completed a series of elaborate calculations based on observations of the moon, which clear away some of the difficulties of the question as regards our satellite. His published results are for the most part abstruse and technical—appreciable only by astronomers: but among them occur certain matters of popular interest. He finds, for example, that the moon's centre of gravity is 59,000 mètres (about forty miles) from the centre of its mass, a difference sufficiently great to produce an effect. 'Hence,' he argues, 'we ought to consider the two hemispheres of the moon, of which one is visible and the other invisible for us, as essentially different with regard to their levels, their climates, and all that depends thereon. Seeing that the lines of level regulate themselves principally with reference to the centre of gravity, the hemisphere of the moon turned towards us, rises much more beyond the mean level than the opposite hemisphere; and although the former presents itself to us as a sterile region, void of atmosphere, and of animal life, we cannot conclude it the same for the latter. The mean level should prevail round the edge, as seen by us; and in truth we cannot say but that some traces of atmosphere do shew themselves.'

A paper 'On the Laws of the Strength of Wrought and Cast Iron,' by Mr W. Bell, has been read before the Institution of Civil Engineers. The subject is one eminently interesting to the profession. The author has taken all the trustworthy experiments hitherto made, and comparing them with each other, deduces certain laws conformable with the prevalent theory. The phenomena of tension, compression, and breakage of the several kinds of iron are examined and discussed, and exemplified by mathematical formulæ. Mr Bell considers the opinion, that in an overstrained and breaking beam 'the neutral axis is at or above the top of the beam,' to be erroneous, and cites as evidence some of Sir David Brewster's experiments in passing polarised light through a piece of glass subjected to transverse strain. Here we see optics brought to bear in a question of mechanics. Leaving aside the dry and difficult technicalities, we give the propositions established by the paper. '1. That in experiments where the materials are but slightly strained, theory and experiment coincide; 2. That where the ordinary theory applies to the rupture of beams, and especially large beams of wrought iron, theory and experiment practically coincide; and last, that the ordinary theory of the strength of materials is more trustworthy than is generally supposed.' The subject is one of first-rate importance. A somewhat similar paper 'On the Strength of Iron Pillars,' has been read before the Royal Society by Mr Eaton Hodgkinson, giving the results of a long series of experiments made with his usual care. The cost of these experiments has been defrayed by a portion of the Royal Society's government grant, and the liberality of Mr Robert Stephenson.

Mr Basford's new method of purifying gas is attracting notice; instead of lime, he uses charcoal saturated at red-heat with lime-water, by which all the sulphur and ammonia are effectually stopped, while, as we hear, the quantity of gas obtained per ton of coal is all but doubled. On the continent, great improvements have been made in the manufacture of gas from wood: at Zurich, Heilbronn, Munich, and other places, it is largely used; and, according to report, five feet of wood-gas give as much light as six feet of coal-gas.—Extensive beds of clay, rich in aluminum, have been discovered in the state of New Jersey, United States, where our enterprising cousins will doubtless turn them to profit.—So much has the process of extracting

the aluminum been simplified, that two kilogrammes of the metal are produced every day at a laboratory in the Rue St Jacques, Paris, at a cost of not more than 300 francs the kilogramme. The eagles on the standards of the French army are now made of aluminum, and with a considerable saving in the weight to be carried.—Chevreul has communicated to the Académie a paper setting forth researches made by him on certain ancient bronze statuettes brought from Egypt. We take one example. He placed a small completely oxidated effigy of Anubis in a porcelain tube, filled the tube with hydrogen gas, and raised it to a dull red heat. Presently, water, coloured green, was seen to condense in the bell-glass, and after letting the apparatus cool, 'I took out the statuette,' he says, 'completely revived; I place it before the eyes of the Académie, together with the water and chlorhydric acid which represent the oxygen and chlorine of Egypt, now transformed at Paris by hydrogen into water and acid.' This reminds us of the admirably ingenious restoration of the Ninevite ivories by boiling them in gelatine, as suggested by Professor Owen.

A species of concrete (*béton*) in which ashes are a principal ingredient, has of late been advantageously introduced for building purposes in Paris. We have heard of a manufacturing firm who utilise most of their waste in the working up of this new material. So rapidly has this artificial stone been improved, that slabs for floors are now made seven mètres long by six mètres wide, which, being laid all in one piece, no beams or vaulting are necessary underneath. M. Coignet states: 'I fabricate in *bétons agglomérés*, as hard as the best stone, all the parts of a house—cellars, drains, paving-slabs, sinks, walls, floors, roofs, exterior ornaments, without using wood or brick. By this process, the house, however large it may be, is a monolith; and this monolith equals, at least in solidity, masonry of hewn stone, and costs much less than the coarsest building in rubble.'

There is talk of adopting at Paris the process in use at Leicester for deodorising and utilising the sewage. The contents of the sewers being discharged into reservoirs, the solid matters are precipitated by means of lime, the water flows off clear, and the mud raised by an Archimedean screw, is dried in a centrifugal machine, and sold for manure in the form of bricks. A manufactory of *poudrette* has long existed at Paris, and it is believed that a handsome revenue may be derived from works on a larger scale, and a source of insalubrity at the same time neutralised.—Near Marseille, as we hear, an improved hydraulic-ram, beating on a cushion of water instead of a block of iron, has been found of great service in agricultural operations.

The selection of Professor William Thomson of Glasgow as one of the directors in the Atlantic Telegraph Company, is regarded as a satisfactory proof that the best scientific resources will be made available in the great submarine undertaking. In two short papers read before the Royal Society, the professor has thrown out new views on electro-telegraphy at long distances, developing a theory of signalling by pulsations. It is ingenious; but there remains to be seen how it will bear the test of practice.—At the meeting of German naturalists at Vienna last September, Gintl shewed that one telegraphic circuit will affect another which may happen to be near it, though the latter be altogether unconnected with the battery. Pass a current through the first, and the second, as demonstrated by the galvanometer, is visibly affected—in some as yet unexplained way through the earth. The cause will probably be discovered; meantime, the fact accounts for the confusion that sometimes arises in a net-work of telegraph lines, and suggests a means of simplification.

The dispute between Switzerland and Prussia has

given another opportunity for testing the merits of a portable military telegraph, invented by M. Hipp, chief of the federal telegraph construction department—a remarkably effective yet simple instrument. It prints after the manner of Morse's; but the armature is regulated by a single spring only, worked by pressing a small knob. Attached to any line of wire, messages can be received and transmitted, and indeed all the usual operations of telegraphy carried on as with fixed instruments. It, however, weighs no more than twelve pounds complete with its case, which measures ten inches in length, and five inches in breadth and height. Within this small space it contains the transmitting apparatus, a supply of paper, the tools necessary for mounting and dismounting the instrument, an alarm which may be brought into the circuit at pleasure, two drawers holding troughs of gutta-percha of twelve compartments each, furnished with a pile of charcoal and amalgamated zinc. When moistened with dilute sulphuric acid, the action is complete, and little liable to disturbance: an instrument sent from Berne to Paris by diligence and railway, was quite fit for use on arrival.

Among the meteorological phenomena which occurred during December, there fell at Ambleside five inches of rain in twenty-nine hours on the 7th and 8th, whereby a sudden flood was produced in the valleys.—M. de Tesson says in a communication to the Société Philomatique, that fogs, clouds, mists, &c., are not vesicular vapours—in which opinion he is not alone—and that a true study of these appearances would clear up some doubtful points in meteorology.—The Abbé Raillard has laid a paper before the Académie on the same subject. He denies the truth of the vesicular vapour theory concerning clouds, and contends that the phenomenon in question depends on minute division. As gold, when beaten into leaf, falls slowly, so the more the surfaces of water are increased, the more slowly will the water fall. The resistance of air to a drop divided into a thousand parts, is a thousand times greater than to a single drop. Hence clouds are borne up by the friction of the atmosphere. That clouds should consist of vesicular vapour is, in the abbé's opinion, simply impossible: for if it were vesicular, it would be condensed; and if air were contained within the vesicles, the viscosity of the husk or shell would have to be something very different from that of water. This is a subject of especial interest to meteorologists, many of whom entertain similar views; and considering the activity which now prevails in their branch of study, we may look for important advances towards establishing it as a science.

The great oceanic survey, which we have from time to time mentioned, is making satisfactory progress. Reports with tabular details have already been received from some of the ships employed, and these will be discussed and the results brought out under the superintendence of Captain R. Fitzroy, Marine Department of the Board of Trade. The work of this survey, as will be remembered, was begun by the United States government; and our Admiralty now undertake a class of observations not embraced by the Americans, and highly beneficial consequences are hoped for from this co-operation of the two nations.—Lieutenant Maury recommends that the routes for ships crossing the Atlantic should be set off into what he calls 'lanes,' or pathways some twenty-five miles wide, one to be used by steamers going, the other by steamers returning—following the law of the road to prevent collisions. The breadth of the route travelled by the Cunard steamers is 300 miles; and it is clear that a lane fifty miles wide might be followed on either margin, and the risk of vessels meeting entirely avoided.

For some years, tide-observations have been made round the coasts of Ireland, for the purpose of

discovering the various phenomena connected with the tides, currents, &c., and so facilitating navigation. Among the results obtained, there is one which at the first glance appears all but impossible. The Rev. Professor Haughton, of the Royal Irish Academy, has been enabled, by ingenious calculations based on those tide-observations, to infer the depth of the ocean. One of his conclusions, omitting fractions, is eleven miles; the other, five miles. The first is the depth of the vast central channel up which the great tidal wave rolls from the antarctic pole; the second is the mean depth of the whole Atlantic Ocean. We noticed some time ago a deep-sea sounding of seven miles, taken in the South Atlantic: this favours the professor's theory, and we shall perhaps learn, from the surveys and explorations now in progress, whether the deepest places have yet been sounded.

GOING TO THE PLAY IN CHINA.*

At the end of the street or alley we now entered, we observed a vast court surrounded with scaffoldings crowded with people, and at the further end, on a stage, the actors were to perform their parts—the river, forming the harbour of Canton, and its countless vessels, being the background of the picture.

To think of forcing our way through the crowd which encumbered the pit (the court), was perfectly useless; but thanks to the eloquence of M—, we entered a house, through which we were allowed to pass, on payment of half a *gourde* each; and in this manner succeeded in gaining one of the scaffoldings which was on a level with the first story of the house. Here we found several rows of benches, ranged one above the other, and selecting one of the highest, for the purpose of commanding a better view, we quietly took our seats.

The arrangement of the theatre was as follows:—An oblong enclosure was shut in on both sides by the boxes—covered galleries erected on wooden stakes—and here were assembled all those who paid for their admission. The stage, likewise supported on pillars, and covered, not with matting, like the gallery, but with painted cloth, formed one of the small corners of the right angle, and extended to the edge of the water; finally, a wall which joined the house through which we had entered, to another house opposite, completed the enclosure of the vast space, leaving only one door open for the crowd, who occupied the pit gratis.

At the moment of our arrival, a clever mountebank belonging to the *troups* was filling up the pause between the acts by passing his body through the rounds of a ladder, jumping backwards over chairs, &c. As this was not a very exciting spectacle, I bestowed all my attention on the assembly among whom we now found ourselves, and wherein we were the only Europeans. I remarked, first of all, that among all those grave Chinese heads, surmounted by black leather caps or conical hats, were some really pretty women, whose *coiffures* were ornamented with flowers and gold pins. Their costume, though simple, was nevertheless scrupulously neat; but although they possessed the most diminutive feet in the world, these beauties, with their oblique eyes, must have belonged to an inferior class of society, as the higher orders of women never shew themselves in public. On one side, but at the extreme end, there were also three or four girls, whose friends seemed apprehensive lest we should approach them. At our feet, on the

* This sketch is from the pen of a French naval officer, formerly stationed in the Chinese waters.

neighbouring benches, the good burghers of Canton, who had been probably sitting in the same place ever since the morning, were eating fruit and sweetmeats, which were supplied by ambulatory merchants; while others calmly smoked their metal pipes, whose narrow bowls will admit of only one pinch of tobacco at a time. A servant attends on each pipe, lighting it with a sort of phosphoric match; and this operation has constantly to be renewed, as a longer puff than usual is sufficient to exhaust the bowl.

All these people interested me very much; but the really exciting feature of the place, and of which we never grew tired, was the pit. Picture to yourself some thousands of Chinese stripped down to their waists, in order to save their clothes—their long queues rolled round their heads, lest these ornamental appendages should be laid hold of by the crowd—squeezing and pushing each other until they form a compact mass—a single block of human beings. There lies before you a sea of shaven heads, all of the same form and colour, as if it was the head of a single man repeated a thousand times in a multiplying mirror. Now calm, now agitated by an imperceptible movement, the surface of this sea presents the appearance of a brown cloth, dotted with flat noses, and eyes that wink with desperate excitement. Suddenly the waves, lulled for a time, become agitated by some unknown cause, dash forwards, then backwards, with irresistible force, and a deafening sound—a confused murmur of voices laughing, shouting, crying, and menacing. The heavy stakes which support the stage are scarcely strong enough to resist the repeated shocks of these rolling masses. In vain those who are nearest endeavour, by catching at the stakes, to make buttresses of themselves, to stay the impetuous flood—their arms at length drop, and they are speedily carried away under the scaffolding down to the river.

If everything in this strange theatre appeared to us curious and new, our presence produced assuredly the same effect on the assembly; for besides the investigations of which we were continually the subject, every burst of applause, as the play went on, was accompanied by the pretty Chinese girls, the beatified smokers, and even the unfortunate wretches forming the troubled sea of bald heads, all turning their eyes upon us, and seemingly endeavouring to discover the degree of interest we took in the spectacle.

After the mountebank had finished his tricks, the actors, whose dressing-room is a tent at the back of the stage, appeared, much to the satisfaction of the public. Ranged on each side of a high table, they wait until the manager has explained to the audience the nature of the piece they are about to witness. As soon as this formality—very rigorously observed in China—is completed, three or four personages, covered with magnificent robes, whose cost is said to be enormous, come forth majestically upon the stage. One of these individuals, in order to mark his supreme dignity, wears in his hat, in the manner of horns, the two long and beautiful feathers of the tail of a Barbary pheasant. He seats himself at a table, while the grantees of his court, the ministers of state, the literati, and the populace at large, remain respectfully standing in two rows before him. I was surprised to find in these costumes the exact reproduction of those I had been accustomed to see in Chinese designs—the rich dresses studded with gold and silver, the heavy wings attached to the head-dress, the flags issuing from all parts of the person, and, above all, the grotesque painting, the lines of black, white, red, and yellow, which render the human face a diabolical mask. I was informed that this was a representation of the earliest Chinese courts; that the costumes were scrupulously correct; and that the fashion of the period was for the nobles, according to their several ranks, to beamear their faces so as to render them unrecognisable.

The emperor or chief who sat at the table, in the course of conversation, appeared to accuse one of the great personages of his court of some crime. This man, who was dressed in black, and apparently belonged rather to the literary than the warlike class, immediately left his place on hearing this accusation, and falling on his knees, muttered in a distressing tone of voice a long prayer, frequently striking his head against the earth. The judge, however, was immovable, and pronounced sentence; and at intervals during his speech, the guards and assistants uttered in chorus a sharp discordant cry, which signified, as I was informed, acquiescence in the will of the prince. All at once, a woman in tears—a man plays the part—rushes on the stage: she is the wife of the prisoner, and throwing herself on her knees before the judges, implores their mercy. But her supplications and tears are all in vain.

So terminated one act of the piece, which appeared to interest very much the spectators; whose applause quite stifled the sound of the tam-tams, gongs, and other discordant instruments—instruments, however, far less discordant and piercing than the voices of the actors. Indeed, the efforts of these unhappy beings were distressing to witness; their eyes seemed starting out of their heads, and the veins of their necks were swollen to such a degree as to induce serious fears for their safety. Fatigued at length with the tumult, new and interesting as the scene was, I found that I had been quite long enough at the play; and as night was coming on, we soon afterwards retired on board our ship.

VIGILS.

A young and yet unbelted knight he seems
Watching his maiden armour by the well.
He standeth in the moonlight dim and gray,
With darkness round, on which his steady gaze
Is bent, expectant of some issuing foe.
The light of a great purpose seems to burn
In those bright, lucid eyes—and the young lips
Are white and stern with high expectancy.
So stands he silent in the silent light,
Pale, fixed, and eager—guarding those pure arms
Which Honour on the morn shall gird him with,
And send him forth on quests of high emprise
Her tried and loyal knight.

O ardent youth

On whom the mail of manhood hath not fallen,
Has not this scene a teaching good for thee?
Thou too hast arms to guard, God-given and fair.
Watch that no stain obscure their lovely sheen:
Watch through the night-hours for the envious foe
Whose birth is of the darkness, yet whose power
Harms not him standing in the gentle light
Of strong and glowing truth. Then hopefully,
With bright, unsullied armour, go thou forth,
To fight for Truth with many a world-born wrong
Which reigns supreme, and drinks of human tears
As monsters did of old. Go, and fear not;
Fight through the Night, till breaks the blessed Dawn—
When thou shalt see a shining Presence stand
To crown thee victor from thy arduous strife
In Life's great lists, and heir to glorious lands
Won by thy wounds, O soldier of the Cross!

PRICE 1½d.

THE BIRCH, ANCIENT AND MODERN.

WHEN Master Adolphus Smith, who has been detected in a suspicious situation in the school-orchard, is sentenced by the Rev. Kane M'Tawse of the academy, Birch Grove—who receives a limited number of young gentlemen at L.40 per annum—to a gentle titillation with a certain well-known instrument of juvenile torture, that apple-munching youth is not in the least aware of the very great antiquity of the punishment which his learned instructor delights to inflict. If young Smith but knew the ancient customs of the Lacedæmonians, and how boys like him were whipped for hours before an altar, making it a point of honour not to cry, there can be no doubt that the young gentleman could bear the sentence of M'Tawse with much greater equanimity than, we regret to say, is usually his practice. We may be permitted to hope that, as his classic knowledge extends, the veil of ignorance will be withdrawn, and the examples of these Spartan youths will ultimately take effect. But there are so many of this young gentleman's seniors in a state of ignorance on the subject as to demand inquiry, and we are astonished that some of our keen-eyed dealers in *Common Things* and *Things not Generally Known*, have not long ere this 'familiarily explained' the word Birch. Even in our most ponderous encyclopædias, we have to turn to the word 'Flagellant' before we can even partially satisfy our curiosity; and these learned repositories contain but a few dry sentences about 'a sect of religious fanatics.' This utter darkness as to such a thing as birch is most extraordinary; so extraordinary, that an ancient author recommends a work on the subject, and says that a time will sooner or later arrive when the discipline and flagellations which were in use for so many centuries, will be considered by the people so whimsical and absurd as to be unworthy of belief, although these same persons will be in the daily practice of other customs equally absurd and whimsical.

The origin and early development of flagellation is involved in great obscurity, and therefore it is hardly necessary to say that we have not the means of tracing the first whipping which was inflicted, or the name and address of him or her who administered it. The nature of the subject, too, is exceedingly repulsive, but we have a shrewd guess that the population of the world would not be very numerous when such a practice was instituted. We will not at present, however, venture into any inquiry as to antediluvian discipline, although in these times of book-reading we have occasionally had thoughts of doing a little to be entitled *Birch before the Flood*, illustrated

with cuts, but will confine ourselves to the subject in its more modern aspect.

'Once upon a time' that we have read about, a tremendous dispute agitated the learned world as to whether whipping as a penance, or whipping as a punishment, was first introduced. One author contended for one view of the case, and his opponent fought to establish an opposite theory. The learning of each was flashed in the face of the other, and, as usual, the dispute ended by each thinking the other wrong. The relation of facts evolved by the controversialists, is so clouded in words and lost in old Latin quotations, or so frittered away in notes and commentaries, as to make it a task of no small difficulty to separate the corn from the chaff. We need not further allude to the controversy than merely to say, that all the probabilities of the case are in favour of punishment as first giving occasion for the use of the rod, although a strong case has been made out on behalf of those who hold a different opinion. We may remark upon the fondness of some of the ancient saints for the penance of flagellation, as detailed by those writers who take this view of the subject; one saint in particular was so fond of it, as to inflict upon himself, at one performance, a complement of 183,000 stripes! As, however, his daily allowance was 80,000 lashes, this immense number need not be much wondered at: things are only great by comparison, and this gentleman, it is hinted, wore a cuirass!

The ancient Romans carried the practice of flagellation further, perhaps, than any other nation; and we have been so fortunate as to find several authors who refer to their use of the scourge. Flagellatic emblems were common in every house; and the judges of the nation, with a desire to strike all evildoers with terror, were surrounded with those instruments of chastisement. They had all different names: there was the *ferula*, a flat strap of leather, which was the mildest of all; then came the *scutica*, an instrument of twisted parchment, which was a degree more severe than the first named; after that there was the *flagella*, and the terrible *flagellum*, the severest of all, which was composed of plaited thongs of ox-leather. There were other instruments of punishment still more terrible than even these, such as balls of metal stuck full of small sharp points, and fastened to the end of long whips. So prevalent did the practice of whipping slaves become, that in course of time these unfortunates came to be named after the particular kind of flagellation they were made to undergo; in fact, the scourge was looked upon by the Romans as characteristic of dominion. The master or mistress of a Roman household in those days often exercised their terrible powers

with unrelenting severity, and the poor slaves were not unfrequently scourged to death from a mere caprice. It was quite a sufficient excuse among the Roman ladies to whip a slave, if, as Juvenal expresses it, their nose displeased them; in other words, if they were not satisfied with the state of their own charms. Their wantonness of power was carried still further, if we may credit the same Juvenal. It was a customary thing with some of them, when they proposed having their hair dressed with both nicety and expedition, to have the dressing-maid stripped to the waist, ready for flagellation should she be guilty of any fault or mistake in performing her task. The fair termagants at last carried these cruelties to such a pitch, that in the beginning of the empire it was found necessary to restrain their licence. During the reign of the Emperor Adrian, a lady was banished for five years for inflicting undue cruelties on her female slaves. The smallest faults, such as breaking glasses or over-seasoning dishes, exposed these wretched serfs to grievous whippings, which were generally inflicted in presence of guests who happened to be entertained at table, as a means of affording a little diversion.

In addition to the flagellating customs of the ancient Romans, we may allude to a ceremony which was common among the Lacedæmonians, and called the Day of Flagellation, on account of the ceremony of whipping, in front of the altar of Diana, a number of boys, who freely submitted to that painful treatment. Various authors mention this fact. Plutarch says: 'Boys are whipped for a whole day, often to death, before the altar of Diana the Orthian, and they suffer it with cheerfulness, and even joy; nay, they strive with each other for victory; and he who bears up longest, and has been able to endure the greatest number of stripes, carries the day. This solemnity is called the contest of flagellations, and is celebrated every year in presence of the parents.' The reward to these martyrs of the birch was a stone; and statues similar to those which we erect to our poets and men of learning, were erected to their memory in the public places of Sparta.

The madness of the *Luperci* is scarcely worth alluding to; they were simply a disgust: and it is surprising that their festival, as it was called, should have existed for several hundred years after the introduction of Christianity. Their orgies have been recorded in the works of different authors. They were performed on occasions of particular solemnities, when the actors in them, reduced to a state of nudity, ran about striking each other with great fury. The following brief account of the sect is from the latest edition of the *Encyclopædia Britannica*:—'The first recorded instances of self-flagellation are isolated cases which happened about the beginning of the fifth century of the Christian era. From this date, the practice began to spread till the middle of the eleventh century, when, by the precepts and example of Damian, it came to be regarded by many religious persons as a sort of duty. The custom was very warmly opposed by the more liberal minds among the clergy, but it continued to spread in despite of all opposition; and soon after the middle of the thirteenth century, the devotees of the system, no longer content to mortify themselves in private, began to do so in public. Societies were now formed by which the doctrine of flagellation was promulgated throughout Europe; and the excesses into which they were frequently hurried by the ardour of their enthusiasm, excited the astonishment even of their contemporaries.'

Leaving the days of ancient Rome and the festival of the Lupercalia, we may, by a bold leap over a few troublesome centuries, arrive at a period much nearer our own day, when King Birch reigned with terrible severity over the religious public; when flagellation as a penance was a rage, and as a punishment was

rigorously observed both in the king's palace and in meaner households. As an example of the discipline of the court, we may cite Brantome's quaint account of the misfortune which befell Mademoiselle de Limeuil, a maid of honour to the queen of Henry II. of France. This lady, as that author relates, was of high birth, great beauty of person, very handsome, very witty, and an adept in the use of her pen. She had been placed at court in the capacity of a lady-in-waiting, and she had been there but a few months when she tried her wit at the expense of the ladies and gentlemen by whom she was surrounded, and wrote a pasquinade in which all were made to appear. These verses, being ingeniously written, spread very fast, and people were curious to know who had composed such a satire. At last it was found out that Mademoiselle de Limeuil was the author; and as the queen, besides being a lady of serious temper, was grown disgusted with the great licence of writing that prevailed at court, and had determined at least to prevent any satire or lampoon from originating in her own household, orders were given, in consequence of which mademoiselle was rewarded for her verses by a whipping; and those young ladies in the suite of the queen who had been privy to the composition of the pasquinade, were likewise flagellated. The author we have cited thus moralises on the event: 'The instance of flagellation just now related, from which neither the beauty, nor the birth, nor the rank of the culprits, nor the brilliancy of their wit, their readiness at their pen, nor happy turn for satire, could screen them, clearly shews how much flagellations were in esteem in the times we speak of, and how much efficacy they were thought to possess for insuring those two great advantages—good order and decorum.' Such disciplines were not, however, confined in these noble houses to ladies: wholesome corrections of a similar kind were also frequently bestowed on the male retainers—the pages coming in for a large share of attention, and even strangers visiting the place were not exempted.

There has been a great deal of controversy on the subject of flagellation in nunneries, both as to such punishments being improper, and as to the right mode of infliction. We do not propose to enter at all into this very delicate part of the subject, but shall merely repeat a statement of Du Cange, who tells us of the different ceremonies observed in convents during the administration of discipline. He says that flagellations have to be suffered in the presence of the whole congregation—that in monasteries the discipline is administered by the hands of a 'vigorous brother'; and in the nunneries, by 'an elderly morose sister.'

It may be permitted us here to abridge from Delolme's *History of the Flagellants*, the following notices of the fathers of St Lazare, in Paris, whose school was known as 'the Seminary of the Good Boys.' These reverend fathers carried on an extensive business as general flagellators, the punishments being inflicted, as previously arranged, on parties carrying a recommendatory letter to this effect. Being situated in the metropolis, it was a most convenient place of punishment. Fathers or mothers who had undutiful sons, tutors who had unruly pupils, uncles who were intrusted with the education of ungovernable nephews, masters who had wickedly inclined apprentices, whom they durst not themselves undertake to correct, applied to the fathers of St Lazare, and had their wishes gratified. So regular was the trade carried on by the good fathers in that branch of business, that letters of the above kind were literally notes of hand payable at sight. Ludicrous incidents frequently arose out of their mode of doing business. Young culprits, who suspected what was in the wind, contrived to get some other person to take charge of their letter—with what result the reader may guess. Others who had letters to carry to the house of Lazare, the contents of

which they did not mistrust, would often enough undesignedly charge other persons to deliver them; and the unfortunate bearer had no sooner presented his card of introduction, than he was straightway collared, prepared for the discipline, and rewarded for his good-nature by having administered to him a most excellent flagellation. When a lady had been slighted by her lover, she brought all her wit to bear upon his punishment, and frequently contrived to have it inflicted by the fathers at the seminary of St Lazare. An artful scheme was contrived to get the unfortunate individual, under some pretence or other, to call at the place, and the reverend disciplinarians, having been previously advised and paid, took good care to make the faithless gallant yield ample satisfaction to the injured fair one. The system of St Lazare ultimately led to such abuses as to attract the attention of the government of the period, who caused the seminary to be abolished.

We have not sufficient space to relate all the anecdotes of flagellation which have been handed down to us from the remote monastic ages, but the following is one which deserves to be recorded: A certain jovial friar, who had a keen eye to the good things of this world, found the means of procuring a number of fine dishes and a quantity of rare wine which his vows expressly forbade his class to partake of. He invited a select number of his brethren to share in the feast; and as it would have been attended with certain detection, if it had been laid out in any of their cells, they selected one of the large brewing-tuns of the monastery as a dining-room. As the feasting was held on several successive days, the abbot began to wonder at so many of the monks mysteriously disappearing at a certain hour. Being unable to find them either in their cells or in the chapel, he went himself on a voyage of discovery, and descending to the vaults, the savoury perfume of the dishes at once betrayed the secret dining of the jolly friars. The abbot slyly took his measures, and at once made his entrance into the hidden apartment. As may be supposed, the brethren were prodigiously alarmed; but the abbot soon set them all at their ease, expostulated with them for making the feast a secret, begged leave to join their revelry, partook of the wine and the well-seasoned dishes, and spent the greater part of the afternoon in a most agreeable and convivial manner. At last the banquet terminated, and the monks dispersed, not without serious misgiving that something would come out of all this; and they were right. 'Next day,' says Delolme, 'a chapter having been summoned, the abbot desired the prior to fill his place, then standing forth, he accused himself of the sin he had committed the day before, and requested to be well flogged for it. The prior objected much to such a discipline being inflicted on the abbot, but the latter having insisted, his request was complied with. This proceeding greatly astonished his boon-companions, but there was no escape. They were compelled to follow the example of the abbot, and that astute individual had so arranged matters, as to insure each of the delinquents a sound flogging.'

There are many interesting anecdotes connected with the birch. In the French *Causés Celibes*, we find the reports of various trials—arising out of the practice of flagellation—one in particular, where a noble lady waylaid another high personage of the same sex, and had her whipped by her servants. In London, about three hundred years ago, a clergyman was tried for administering to his housemaid 'a discipline after the manner of a school-boy,' and he even defended his conduct in a quarto pamphlet. The old practice of birching all the children of a family every time an execution took place, may be also referred to. This was a common practice some centuries ago, and its object was to keep the sufferers in mind of what had occurred. The still more recent plan of flogging the

pauper children at the boundaries of the parish, in order that they might recollect them if disputes arose, seems a remnant of the same custom. One anecdote of 'penance' which we have heard is as follows: A lady, after having been to confession, was ordered to mortify her flesh, and to get some person to inflict upon her a hundred blows. The priest, however, forgot to say with what kind of instrument; and the lady, taking advantage of his oversight, caused her servant to flagellate her with a bunch of ostrich feathers. We may bid farewell to the ancient part of our subject by referring to the case of Clopinel, a court poet, who wrote a malicious libel on some of the ladies of the court. These beauteous maids determined to be revenged on the poet, and at a consultation which was held, it was unanimously determined that he should be flagellated. At a convenient time, he was seized and prepared for the rod, which the fair ones had determined to administer in person. He was saved, however, from the infliction by his presence of mind; 'piteously addressing the angry yet beauteous group around him, he humbly entreated that the first blow might be struck by the honourable damsel who felt herself the most aggrieved; and it is needless to add that not a lash was inflicted.'

A recent correspondence in the *Times* newspaper gives us the information that birch is not yet extinct in Great Britain, and that, having been banished from court, and almost fallen into disuse in our criminal code, it has found refuge in our great public schools, making Eton its head-quarters. We need not travel so far as Russia to laugh at flagellation in the nineteenth century, since we can have it at home. As the modern case has been made public through the columns of the London daily press, we need have no delicacy in alluding to it here. A gentleman, who had placed his two sons at Eton, heard that the eldest one had been flogged, and as this young man was eighteen years of age, the father thought the punishment very improper, and wrote to his boy instructions not again to submit to such a punishment. 'I consider such a humiliation as disgraceful both to the party receiving and inflicting it; therefore be on your guard how you expose yourself to so degrading an exhibition as that of your person on the whipping-block. It is fitting for the felon, but does not become a gentleman. Therefore, once more be on your guard, and should your love of fun or insubordination place you again in such a position, I desire that you will leave Eton, and not permit any one so to insult you and common decency as long as you can defend yourself. I am aware that Eton customs do not attach such disgrace to flogging as elsewhere, and it is one of the greatest objections to this practice that it actually deprives itself of its effect by its frequent repetition. Up to a certain age, flogging may be tolerated; but when the child approaches the period of manhood, such a mode of punishment is revolting to every mind which is capable of being actuated by manly and correct feelings. I wish you to shew this letter to your tutor, in order that he may be made acquainted with my views on this point, and, if he should think proper, communicate them to Dr Goodford.' Accordingly, about three months ago, the young gentleman having been found 'smelling of smoke,' and not choosing to tell an untruth, he did not deny that he had been smoking, and for this he was again sentenced to receive the rod, but in obedience to his father's instructions, he left Eton. This is modern birch—young men of eighteen, nineteen, and even twenty years of age, flogged *supra dorsum nudum* by the head-master of the school, who, from his position, must be a man of great learning and eminence, moving, of course, in the best society, and yet reduced by this tyrant custom to the level of a drummer in the army. We leave it to Mr Thackeray to class this modern

absurdity along with that other one which he so well describes in his 'Four Georges'—the lace-bedizened courtier walking backward, like a crab, before a certain great lady at the opening of the Crystal Palace.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XVIII.—THE PHANTOM HORSE.

I HAVE encountered dangers—not a few—but they were the ordinary perils of flood and field, and I understood them. I have had one limb broken, and its fellow bored with an ounce of lead. I have swum from a sinking ship, and have fallen upon the battlefield. I have looked at the muzzles of a hundred muskets aimed at my person, at less than thirty yards' distance, and felt the certainty of death; though the volley was fired, and I still live. Well, you will no doubt acknowledge these to be perils. Do not mistake me; I am not boasting of having encountered them; I met them with more or less courage—some of them with fear; but if the fears inspired by all were combined into one emotion of terror, it would not equal in intensity that which I experienced at the moment I pulled up my horse upon the prairie.

I have never been given to superstition; perhaps my religion is not strong enough for that; but at that moment I could not help yielding to a full belief in the supernatural. There was no *natural* cause—I could think of none—that would account for the mysterious disappearance of the horse. I had often sneered at the credulous sailor and his phantom ship; had I lived to look upon a phenomenon equally strange yet true—a phantom horse?

The hunters and trappers had indeed invested the white steed with this character; their stories recurred to my memory at the moment. I had used to smile at the simple credulity of the narrators. I was now prepared to believe them. They were true!

Or was I dreaming? Was it not all a dream? The search for the white steed—the surround—the chase—the long, long gallop?

For some moments I actually fancied that such *might* be the case; but soon my consciousness became clear again: I was in the saddle, and my panting, smoking steed was under me. That was real and positive. I remembered all the incidents of the chase. They, too, were real of a certainty; the white steed had been there: he was gone. The trappers spoke the truth. The horse was a phantom!

Oppressed with this thought, which had almost become a conviction, I sat in my saddle, bent and silent, my eyes turned upon the earth, but their gaze fixed on vacancy. The lazo had dropped from my fingers, and the bridle reins trailed untouched over the withers of my horse.

My belief in the supernatural was of short duration; how long I know not, for during its continuance I remained in a state of bewilderment. My senses at length returned. My eyes had fallen upon a fresh hoof-print on the turf, directly in front of me. I knew it was that made by the white steed, and this awoke me to a process of reasoning. Had the horse been a phantom, he would not have made a track? I had

never heard of the track of a ghost; though a *horse ghost* might be different from the common kind!

My reflections on this head ended in the determination to follow the trail as far as it led; of course to the point where the steed must have mounted into the air, or evaporated—the scene of his apotheosis.

With this resolve, I gathered my reins, and rode forward upon the trail, keeping my eyes fixed upon the hoof-prints. The line was direct, and I had ridden nearly two hundred yards, when my horse came to a sudden stop. I looked out forward to discover the cause of his halting; with that glance, vanished my new-born superstitions.

At the distance of some thirty paces, a dark line was seen upon the prairie, running transversely to the course I was following. It appeared to be a narrow crack in the plain; but on spurring nearer, it proved to be a fissure of considerable width—one of those formations known throughout Spanish America as *barrancas*. The earth yawned, as though rent by an earthquake; but water had evidently something to do with its formation. It was of nearly equal width at top and bottom, and its bed was covered with a débris of rocks rounded by attrition. Its sides were perfectly vertical, and the stratification, even to the surface-turf, exactly corresponded—thus rendering it invisible at the distance of but a few paces from its brink. It appeared to shallow to the right, and no doubt ended not far off in that direction. Towards the left, on the contrary, I could see that it became deeper and wider. At the point where I had reached it, its bottom was nearly twenty feet from the surface of the prairie.

Of course, the disappearance of the white steed was no longer a mystery. He had made a fearful leap—nearly twenty feet sheer! There was the torn turf on the brink of the chasm, and the displacement of the loose stones, where he had bounded into its bed. He had gone to the left—down the barranca. The abrasion of his hoofs was visible upon the rocks.

I looked down the defile: he was not to be seen. The barranca turned off at an angle at no great distance. He had already passed round the angle, and was out of sight. It was clear that he had escaped; that to follow would be of no use; and with this reflection I abandoned all thoughts of carrying the chase further.

After giving way to a pang or two of disappointment, I began to think of the position in which I had placed myself. It is true I was now relieved from the feeling of awe that, but a moment before, had oppressed me; but my situation was far from being a pleasant one. I was at least thirty miles from the rancheria, and I could not tell in what direction it lay. The sun was setting, and therefore I had the points of the compass; but I had not the slightest idea whether we had ridden eastward or westward after leaving the settlements. I might ride back on my own trail; *perhaps* I might: it was a doubtful point. Neither through the timber, nor on the open prairie, had the chase gone in a direct line. Moreover, I noticed in many places, as we glided swiftly along, that the turf was cut up by numerous hoof-tracks: droves of mustangs had passed over the ground. It would be no easy matter for me to retrace the windings of that long gallop.

One thing was evident: it would be useless for me to make the attempt before morning. There was not half an hour of sun left, and at night the trail could not be

followed. I had no alternative but to remain where I was until another day broke.

But how remain? I was hungry; still worse, I was choking with thirst. Not a drop of water was near; I had seen none for twenty miles. The long, hot ride had made me thirst to an unusual degree, and my poor horse was in a similar condition. The knowledge that no water was near, added, as it always does, to the agony, and rendered the physical want more difficult to be endured.

I scanned the bottom of the barranca, and tracked it with my eye as far as I could see: it was waterless as the plain itself. The rocks rested upon dry sand and gravel; not a drop of the wished-for element appeared within its bed, although it was evident that at some time a torrent must have swept along its channel.

After some reflection, it occurred to me that by following the barranca downward, I might find water; at least, this was the most likely direction in which to search for it. I rode forward, therefore, directing my horse along the edge of the chasm. The fissure deepened as I advanced, until, at the distance of a mile from where I first struck it, the gulf yawned full fifty feet into the plain, the sides still preserving their vertical steepness!

The sun had now gone down; the twilight promised to be a short one. I dared not traverse that plain in the darkness; I might ride over the precipitous edge of the barranca. Besides, it was not the only one: I saw there were others—smaller ones—the beds of tributary streams in times of rain. These branched off diagonally or at right angles, and were more or less deep and steep.

Night was fast closing over the prairie; I dared not ride further amid these perilous abysses. I must soon come to a halt, without finding water. I should have to spend the long hours without relief. The thought of such a night was fearful.

I was still riding slowly onward, mechanically conducting my horse, when a bright object fell under my eyes, causing me to start in my saddle with an exclamation of joy. It was the gleam of water. I saw it in a westerly direction, the direction in which I was going. It was a small lake, or—in the phraseology of the country—a pond. It was not in the bottom of the ravine, where I had hitherto been looking for water, but up on the high prairie. There was no timber around it, no sedge; its shores were without vegetation of any kind, and its surface appeared to correspond with the level of the plain itself.

I rode forward with joyful anticipations, yet not without some anxiety. Was it a *mirage*? It might be—often had I been deceived by such appearances. But no: it had not the filmy, gauze-like halo that hangs over the mirage. Its outlines were sharply defined by the prairie turf, and the last lingering rays of the sun glistened upon its surface. It was water!

Fully assured of this, I rode forward at a more rapid rate.

I had got within about two hundred paces of the spot, keeping my eyes fixed upon the glistening water, when all at once my horse started, and drew back! I looked ahead to discover the cause. The twilight had nearly passed, but in the obscurity I could still distinguish the surface of the prairie. The barranca again frowned before me, running transversely across my path. To my chagrin, I perceived that the chasm had made a sudden turn, and that the pond was on its opposite side!

CHAPTER XIX.

A PRAIRIE DREAM.

There was no hope of crossing in the darkness. The barranca was here deeper than at any point above; so deep that I could but indistinctly see the rocky boulders at its bottom. Perhaps with the daylight I might be able to find a crossing-place; but from that doubtful hypothesis I derived little consolation.

It had now grown quite dark, and I had no choice but to pass the night where I was, though I anticipated a night of torture.

I dropped to the ground, and having led my horse a few rods into the prairie, so as to keep him clear of the precipice, I relieved him of his saddle and bridle, and left him to browse to the full length of the lazo. For myself, I had but few preparations to make: there was no supper to be cooked, but eating was a matter of secondary importance on that occasion. I should have preferred a cup of water to a roast turkey.

I had but few implements to dispose of in my temporary camp. My rifle and hunting-knife, with horn and pouch, and the double-headed gourd, which served as water-canteen, and which, alas! had been emptied at an early hour of the day. Fortunately, my Mexican blanket was buckled on the croupe. This I untrapped, and having enveloped myself in its ample folds, and placed my head in the hollow of my saddle, I composed myself as well as I could, in the hope of falling asleep.

For a long time this luxury was denied me. The torture of thirst will rob one of sleep as effectually as the stinging pain of toothache. I turned and turned again, glaring at the moon; she was visible only at intervals, as black clouds were coursing across the canopy; but when she shone out, her light caused the little lake to glisten like a sheet of silver. Oh! how that bright water mocked me with its wavy ripple! I could comprehend the sufferings of Tantalus. I thought at the time that the gods could not have devised a more exquisite torture for the royal Lydian.

After some time, the pain of thirst was less intensely felt. Perhaps the cold damp air of night had the effect of relieving it; but it is more likely that fatigue and long endurance had rendered the sense less acute. Whatever may have been the cause, I suffered less, and felt myself yielding to sleep. There was no sound to keep me awake: perfect stillness reigned around; even the usual howling bark of the prairie-wolf did not reach my ear. The place seemed too lonely for this almost ubiquitous night-prowler. The only sign of life that told me I was not alone was the occasional stroke of my steed's hoof upon the hard turf, and the 'crop-crop' that told me he was busy with the short buffalo-grass. But these were soothing sounds, as they admonished me that my faithful companion was enjoying himself after his hard gallop, and strengthened my desire for repose.

I slept, but not lightly. No; my sleep was heavy and full of troubled dreams. I have a sort of half belief that the *role* we play in these dream-scenes wears the body as much as if we enacted it in reality. I have often awaked from such visions feeble from fatigue. If such be the fact, during that night upon the prairie I went through the toils of the preceding day with considerable additions. First of all, I was in the presence of a lovely woman: she was dark-eyed, dark-haired—a brunette—a beauty. I traced the features of Isolina. I gazed in her eyes; I was happy in her smiles; I fancied I was beloved. Bright objects were around me. The whole scene was rose-colour.

This was a short episode: it was interrupted. I heard shouts and savage yells. I looked out: the house was surrounded by Indians! They were already within

the enclosure; and the moment after, crowds of them entered the house. There was much struggling and confusion. I battled with such arms as I could lay hold of; several fell before me; but one—a tall savage, the chief, as I thought—threw his arms around my mistress, and carried her away out of my sight.

I remember not how I got mounted; but I was upon horseback, and galloping over the wide prairie in pursuit of the ravisher. I could see the savage ahead upon a snow-white steed, with Isolina in his arms. I urged my horse with voice and spur, but, as I thought, for long, long hours in vain. The white steed still kept far in the advance; and I could come no nearer him. I thought the savage had changed his form. He was no longer an Indian chief, but the fiend himself: I saw the horns upon his head; his feet were cloven hoofs! I thought he was luring me to the brink of some fell precipice, and I had no longer the power to stay my horse. Ha! The demon and his phantom horse have gone over the cliff! They have carried her along with them! I must follow—I cannot remain behind. I am on the brink. My steed springs over the chasm. I am falling—falling—falling!—

I reach the rocks at length. I am not killed: how strange I am not crushed! But no; I still live. Yet I suffer. Thirst chokes and tortures me: my heart and brain are aching, and my tongue is on fire. The sound of water is in my ears: a torrent rushes by, near me. If I could only reach it, I might drink and live: but I cannot move; I am chained to the rocks. I grasp one after another, and endeavour to drag myself along: I partially succeed; but oh, what efforts I make. The labour exhausts my strength. I renew my exertions. I am gaining ground: rock after rock is passed. I have neared the rushing water; I feel its cold spray sprinkling me. I am saved!

After such fashion ran my dream. It was the shadow of a reality, somewhat disorganised; but the most pleasant reality was that which awoke me. I found myself in the process of being sprinkled, not by the spray of a torrent, but by a plashing shower from the clouds! Under other circumstances, this might have been less welcome, but now I hailed it with a shout of joy. The thunder was rolling almost continuously; lightning blazed at short intervals; and I could hear the roar of a torrent passing down the barranca.

To assuage thirst was my first thought; and for this purpose, I stretched out my concave palms, and held my mouth wide open, thus drinking from the very fountains of the sky. Though the drops fell thick and heavy, the process was too slow, and a better plan suggested itself. I knew that my *serapé* was water-proof: it was one of the best of Parras fabric, and had cost me an hundred silver dollars. This I spread to its full extent, pressing the central parts into a hollow of the prairie. In five minutes' time, I had forgotten what thirst was, and wondered how such a thing should have caused me so much torture!

Moro drank from the same 'trough,' and betook himself to the grass again. The under side of the blanket was still dry, and the patch of ground which it had sheltered. Along this I stretched myself, drew the *serapé* over me; and after listening a while to the loud lullaby of the thunder, fell fast asleep.

CHAPTER XX.

LOST UPON THE PRAIRIE.

I slept sweetly and soundly. I had no dreams, or only such as were light, and forgotten with the return of consciousness.

It was late when I awoke. A bright sun was

mounting into the blue and cloudless sky. This orb was already many degrees above the horizon.

Hunger was the father of my first thought. I had eaten nothing since an early hour of the preceding day, and then only the light *desayuna* of sweet-cake and chocolate. To one not accustomed to long fasting, a single day without food will give some idea of the pain of hunger; that pain will increase upon a second day, and by the third will have reached its maximum. Upon the fourth and fifth, the body grows weaker, and the brain becomes deranged; the nerve, however, is less acute, and though the suffering is still intense, hunger is never harder to endure than upon the second or third days. Of course, these remarks apply only to those not habituated to long fasts. I have known men who could endure hunger for six days, and feel less pain than others under a fast of twenty-four hours. Indians or prairie-hunters were those men, and fortunately for them that they are endowed with such powers of endurance, often driven as they are into circumstances of the most dire necessity. Truly, 'God tempers the wind to the shorn lamb!'

As I have said, my first thought was of something to eat. I rose to my feet, and with my eye swept the prairie in every direction: no object, living or dead, greeted my sight; beast or bird there was none; my horse alone met my glance, quietly browsing on his trail-rope. I could not help envying him, as I scanned his well-filled sides. I thought of the bounty of the Creator in thus providing for his less intelligent creatures—giving them the power to live where man would starve. Who does not in this recognise the hand of a Providence?

I walked forward to the edge of the barranca, and looked over. It was a grim abyss, over a hundred feet in depth, and about the same in width. Its sides were less precipitous at this point. The escarpment rocks had fallen in, and formed a sort of shelving bank, by which a man on foot might have descended into its bed, and climbed out on the opposite side; but it was not passable for a horse. Its cliffs were furrowed and uneven; rocks jutted out and hung over; and in the seams grew cactus plants, bramble, and small trees of dwarf cedar (*Juniperus prostrata*).

I looked into its channel. I had heard the torrent rolling down in the night. I saw traces of the water among the rocks. A large body must have passed, and yet not a cupful could now have been lifted from its bed! What remained was fast filtering into the sand, or rising back to the heavens upon the heated atmosphere.

I had brought with me my rifle, in hopes of espying some living creature; but, after walking for a considerable distance along the edge, I abandoned the search. No trace of bird or quadruped could be found, and I turned and went back to the place where I had slept.

To draw the picket-pin of my horse and saddle him, was the work of a few minutes; this done, I began to bethink me of *where I was going*. Back to the rancheria, of course! That was the natural reply to such a question; but there was another far less easily answered: How was I to find the way? My design of the previous night—to follow back my own trail—was no longer practicable. The rain had effaced the tracks! I remembered that I had passed over wide stretches of light dusty soil, where the hoof scarcely impressed itself. I remembered that the rain had been of that character known as 'planet showers,' with large heavy drops, that, in such places, must have blotted out every trace of the trail. To follow the 'back-track' was no longer possible. I had not before thought of this difficulty; and now, that it presented itself to my mind, it was accompanied by a new feeling of dread. I felt that *I was lost!*

As you sit in your easy-chair, you may fancy that this is a mere bagatelle—a little bewilderment that one may easily escape from who has a good horse between his thighs. It is only to strike boldly out, and by riding on in a straight line, you must in time arrive *somewhere*. No doubt, that is your idea; but permit me to inform you that this depends very much upon circumstances. It would indeed be trusting to blind chance. You might arrive 'somewhere,' and that somewhere might be the very point from which you had started! Do you fancy you can ride ten miles in a direct line over a prairie, without a single object to guide you? Be undeceived, then; you cannot! The best mounted men have perished under such circumstances. It may take days to escape out of a fifty-mile prairie, and days bring death. Hunger and thirst soon gain strength and agony—the sooner that you know you have not the wherewith to satisfy the one, nor quench the other. Besides, there is in your very loneliness a feeling of bewilderment, painful to an extreme degree, and from which only the oldest prairie-men are free. Your senses lose half their power, your energy is diminished, and your resolves become weak and vacillating. You feel doubtful at each step as to whether you be following the right path, and are ready at every moment to turn into another. Believe me, it is a fearful thing to be alone and lost upon the prairies!

I felt this keenly enough. I had been on the great plains before, but it was the first time I had the misfortune to wander astray on them, and I was the more terrified that I already hungered to no common degree. There was something singular, too, in the circumstances that had brought me into my present situation. The disappearance of the white steed, although accounted for by perfectly natural causes, had left upon my mind a strange impression. That he should have lured me so far, and then eluded me in such a way! I could not help fancying design in it; and fancying so, I could attribute such design only to a higher intelligence—in fact, to some supernatural cause! I was again on the edge of superstition. My mind began to give way and yield itself to hideous fancies.

I struggled against such thoughts, and succeeded in rousing myself to reflect upon some active measures for my safety. I saw that it was of no use to remain where I was. I knew that I could make a straight path for a couple of hours at least—the sun was in the sky, and that would guide me—until near the meridian hours. Then I should have to halt, and wait a while; for in that southern latitude, and just at that time of the year, the sun at noon is so near the zenith that a practised astronomer could not tell north from south. I reflected that before noon I might reach the timber, though that would not insure my safety. Even the naked plain is not more bewildering than the openings of the mesquite groves and the chapparal that border it. Among these you may travel for days without getting twenty miles from your starting-point, and they are often as destitute of the means of life as the desert itself!

Such were my reflections as I had saddled and bridled my horse, and stood scanning the plain in order to make up my mind as to the direction I should take.

CHAPTER XXI.

A PRAIRIE REFEAT.

In gazing out, my eye was attracted by some objects. They were animals, but of what species I could not tell. There are times upon the prairies when form and size present the most illusory aspects: a wolf seems as large as a horse; and a raven, sitting upon a swell of the plain, has been mistaken for a buffalo. A peculiar state of the atmosphere is the magnifying cause, and it is only the experienced eye of the trapper

that can reduce the magnified proportions and distorted form to their proper size and shape.

The objects I had noticed were full three miles off; they were in the direction of the lake, and of course on the other side of the barranca. There were several forms—five I counted—moving phantom-like against the rim of the horizon. Something drew my attention from them for a short while—a period of perhaps three or four minutes' duration. When I looked out again, they were no longer to be seen; but by the edge of the pond, at less than five hundred yards' distance, five beautiful creatures were standing, which I knew to be antelopes. They were so close to the pond, that their graceful forms were shadowed in the water, and their erect attitudes told that they had just halted after a run. Their number corresponded with the objects I had seen but the moment before far out upon the prairie. I was convinced they were the same. The distance was nothing: these creatures travel with the speed of a swallow.

The sight of the prong-horns stimulated my hunger. My first thought was how to get near them. Curiosity had brought them to the pond; they had espied my horse and myself afar off, and had galloped up to reconnoitre us. But they still appeared shy and timid, and were evidently not inclined to approach nearer.

The barranca lay between them and me, but I saw that if I could entice them to its brink, they would be within range of my rifle.

Once more staking down my horse, I tried every plan I could think of. I laid myself along the grass upon my back, and kicked my heels in the air, but to no purpose: the game would not move from the water's edge.

Remembering that my serapé was of very brilliant colours, I bethought me of another plan which, when adroitly practised, rarely fails of success. Taking the blanket, I lashed one edge to the ramrod of my rifle, having first passed the latter through the upper swivel of the piece. With the thumb of my left hand I was thus enabled to hold the rammer steady and transverse to the barrel. I now dropped upon my knees, holding the gun shoulder-high, and the gay-coloured serapé spread out almost to its full extent, hung to the ground, and formed a complete cover for my person. Before making these arrangements, I had crept to the very edge of the barranca, in order to be as near as possible should the antelopes approach upon the opposite side. Of course every manœuvre was executed with all the silence and caution I could observe. I was in no reckless humour to frighten off the game. Hunger was my monitor. I knew that not my breakfast alone, but my life, might be depending on the successful issue of the experiment.

It was not long before I had the gratification of perceiving that my decoy was likely to prove attractive. The prong-horned antelope, like most animals of its kind, has one strongly developed propensity—that of *curiosity*. Although to a known enemy it is the most timid of creatures, yet in the presence of an object that is new to it, it appears to throw aside its timidity, or rather its curiosity overcomes its sense of fear; and, impelled by the former, it will approach very near to any strange form, and regard it with an air of bewilderment. The prairie-wolf—a creature that surpasses even the fox in cunning—well knows this weakness of the antelope, and often takes advantage of it. The wolf is less fleet than the antelope, and his pursuit of it in a direct manner would be vain; but with the astute creature, stratagem makes up for the absence of speed. Should a 'band' of antelopes chance to be passing, the prairie-wolf lays himself flat upon the grass, clews his body into a round ball, and thus rolls himself over the ground, or goes through a series of contortions, all the while approaching nearer to his victims, until he has them within springing distance!

Usually he is assisted in these manœuvres by several companions, for the prairie-wolf is social, and hunts in packs.

The square of bright colours soon produced its effect. The five prong-horns came trotting around the edge of the lake, halted, gazed upon it a moment, and then dashed off again to a greater distance. Soon, however, they turned and came running back, this time apparently with greater confidence, and a stronger feeling of curiosity. I could hear them uttering their quick 'snorts' as they tossed up their tiny heads and snuffed the air. Fortunately, the wind was in my favour, blowing directly from the game, and towards me; otherwise, they would have 'winded' me, and discovered the cheat, for they both know and fear the scent of the human hunter.

The band consisted of a young buck and four females—his wives; the nucleus, no doubt, of a much larger establishment in prospect—for the antelope is polygamous, and some of the older males have an extensive following. I knew the buck by his greater size and forking horns, which the does want. He appeared to direct the actions of the others, as they all stood in a line behind him, following and imitating his motions.

At the second approach, they came within a hundred yards of me. My rifle was equal to this range, and I prepared to fire. The leader was nearest me, and him I selected as the victim. Taking sight, I pulled trigger. As soon as the smoke cleared off, I had the satisfaction of seeing the buck down upon the prairie, in the act of giving his last kick. To my surprise, none of the others had been frightened off by the report, but stood gazing at their fallen leader, apparently bewildered.

I bethought me of reloading; but I had incautiously risen to my feet, and so revealed my form to the eyes of the antelopes. This produced an effect which neither the crack of the rifle nor the fall of their comrade had done; and the now terrified animals wheeled about and sped away like the wind. In less than two minutes, they were beyond the reach of vision.

The next question that arose was how I was to get across the barranca. The tempting morsel lay upon the other side, and I therefore set about examining the chasm in order to find a practicable crossing. This I fortunately discovered. On both sides, the cliff was somewhat broken down, and might be scaled, though not without considerable difficulty.

After once more looking to the security of my horse's trail-ropes, I placed my rifle where I had slept, and set out to cross the barranca, taking only my knife. I could have no use for the gun, and it would hinder me in scaling the cliffs. I got to the bottom of the ravine, and commenced ascending on the opposite side where it was steeper; but I was assisted by the branches of the trailing cedar that grew among the rocks. I noticed, and with some surprise, that the path must have been used before, either by men or animals.

The soil that lay upon the ledges was 'paddled' as by feet, and the rock in some places scratched and discoloured. These indications only caused me a momentary reflection. I was too hungry to dwell upon any thought but that of eating.

At length I reached the scarp of the cliff, and climbing out upon the prairie, soon stood over the carcass of the prong-horn. My knife was out, and next moment I was busy playing the part of butcher.

You will no doubt fancy that the next thing I did was to go in search of something to make a fire for the purpose of cooking. I did nothing of the sort; the next thing I did was to eat my breakfast. *I ate it raw*; and had you been in my situation, delicate as you are, you would have done the same.

It is true that, after I had satisfied the first cravings

of appetite with the tongue of the antelope and a few morsels of steak, I became more fastidious, and thought a little roasting might improve the venison. For this purpose, I was about to return to the barranca, in order to gather some sticks of the cedar-wood, when my eyes fell upon an object that drove all thoughts of cookery out of my head, and sent a thrill of terror to my heart. The object in question was a large animal, which I at once recognised as the *grizzly bear*, the most dreaded of all creatures that inhabit the prairie.

LETTERS OF JAMES BOSWELL.*

THE ripened fame and acceptance of that extraordinary book, Boswell's *Life of Johnson*, gives an interest to the personality of the author, which no one seems to have felt when he was alive. A series of characteristic letters by him, illustrated by biographic particulars, is therefore pretty sure of attracting public attention. At first, we suspected it to be a volume of forgeries; but, on inspection, we find the genuineness of the letters to be beyond doubt. They were addressed, throughout the course of thirty-seven years, to a bosom-friend of the writer, a certain Rev. Mr Temple, living in an obscure Cornish rectory. A most singular revelation of personal character they form—the outpouring of the feelings of a man not without talents, acquirements, and good aspirations, but altogether deficient in prudence, dignity, and suitableness for the world's ordinary affairs—one who was not much worse in essential respects than most of his neighbours, but who put himself at the feet of them all by his silly forwardness, love of notoriety, and the constant self-composure of a babbling tongue. For the first half of the book, we altogether doubted the use of its publication, beyond the gratification of those curious in literary history; while of the justifiableness of making such an exposé of the personal vices, weaknesses, and domestic circumstances of one who died only sixty years since, and who has left numerous descendants, there seemed to us to be—something more than doubts. But on reaching the end, our conception of the book underwent a change. We then found the life of the man shewing so impressively the futility of all hopes of happiness based on the mere gratification of vanity and sensual appetites, we found the ultra-gaiety of the clever combinatorial youth ending in such expressions of pain and sorrow, the natural fruits of a long course of dissipation, that we believed the book might prove to have been well worth publishing.

Boswell occupied a position in society of which Englishmen, knowing him only by his books, have in general an inadequate conception. He was, by birth and connections, emphatically a *gentleman*. The eldest son and heir of a landed man occupying the dignified position of a judge, and himself a member of the Scotch bar, he had the fairest prospects in life—might have looked to a great marriage, to entering parliament, to high state employment. We find that, even in his own time, the family estates were £1600 a year. In the ensuing generation, they were probably of considerably more than twice that value, and it seemed but in the fair course of things that a British baronetcy was then conferred on the family. All these advantages Boswell in a great measure forfeited by the literary and social tastes which led him to be the companion of London wits, and enabled him to pen the immortal book which bears his name. Perhaps it were impossible for any Englishman to imagine the *eccentricity* of Boswell as viewed in reference to the Ayrshire gentry and Edinburgh *noblesse de robe* amongst whom he sprung into existence, or those Calvinistic doctrines and sober maxims of life which ought in the course of nature to have descended to him.

* Bentley, London, 1857. 8vo, pp. 408.

The letters to Mr Temple first exhibit Boswell in youth, enthusiastic in study, but doubtful how to direct himself in life. He is constantly engaged in some affair of the heart, which comes to nothing. Already, he haunts the society of such literary men as then dwelt in Edinburgh. Before he was full one-and-twenty, he had dipped into the gneties of London, and found their congeniality. 'A young fellow,' he says, 'whose happiness was always centered in London, who had at last got there, and had begun to taste its delights, who had got his mind filled with the most gay ideas—getting into the Guards, being about court, enjoying the happiness of the *beau-monde* and the company of men of genius, in short, everything that he could wish—consider this poor fellow hauled away to the town of Edinburgh, obliged to conform to every Scotch custom or be laughed at—"Will you hae some jeel? oh fie! oh fie!"—his flighty imagination quite cramped, and he obliged to study Corpus Juris Civilis, and live in his father's strict family; is there any wonder, sir, that the unlucky dog should be somewhat fretful? Yoke a Newmarket courser to a dung-cart, and I'll lay my life on't he'll either caper and kick most confoundedly, or be as stupid and restive as an old, battered post-horse.'

His father early saw how much he was disposed to break bounds, and tried to control him with good counsel. 'Honest man!' says Boswell, 'he is now very happy: it is amazing to think how much he has had at heart my pursuing the road of civil life; he is anxious for fear I should fall off from my prudent system, and return to my dissipated, unsettled way of thinking; and, in order to make him easy, he insists on having my solemn promise that I will persist in the scheme on which he is so earnestly bent: he knows my fidelity, and he concludes that my promise will fix me. Indeed, he is much in the right; the only question is, how much I am to promise. I think I may promise thus much: that I shall from this time study propriety of conduct, and to be a man of knowledge and prudence, as far as I can; that I shall make as much improvement as possible while I am abroad, and when I return, shall put on the gown as a member of the Faculty of Advocates, and be upon the footing of a gentleman of business, with a view to my getting into parliament. My father talks of my setting out soon, but says he will soon write to me fixing my allowance; I imagine, therefore, that I shall go the week after next. I feel no small reluctance at leaving this great metropolis, which I heartily agree with you is the best place in the world to live in. My dear friend, I find that London must be the place where I shall pass a great part of my life, if I wish to pass it with satisfaction. I hope we shall spend many happy years there, when we are both settled as to views of life and habits of living; in the meantime, let me endeavour to acquire steadiness and constant propriety of conduct, without which we never can enjoy what I fondly hope for.'

He went to study law in Utrecht, and in 1766, when twenty-six years old, induced the gown of a Scotch advocate. For a time, he seems to have got some business, chiefly through the indirect effect of his father being on the bench. But Edinburgh was an alien scene, and the whim of the moment was always the guide of Boswell. With inconsistency in which he is, we fear, far from singular, he explicitly tells his clerical friend of a disgraceful connection he has formed, and in the same letter speaks with complacency of going to chapel, and 'looking up to the Lord of the Universe with a grateful remembrance of the grand and mysterious propitiation which Christianity has announced.' In the midst of the same circumstances, but writing from Auchinleck, his father's country-seat, he talks of a respectable marriage. 'What say you to my marrying? I intend, next autumn, to

visit Miss Bosville, in Yorkshire; but I fear, my lot being cast in Scotland, that beauty would not be content. She is, however, grave; I shall see. There is a young lady in the neighbourhood here who has an estate of her own—between two and three hundred a year—just eighteen, a genteel person, an agreeable face, of a good family, sensible, good-tempered, cheerful, pious. You know my grand object is the ancient family of Auchinleck—a venerable and noble principle. How would it do to conclude an alliance with the neighbouring princess, and add her lands to our dominions? I should at once have a very pretty little estate, a good house, and a sweet place. My father is very fond of her; it would make him perfectly happy: he gives me hints in this way:—"I wish you had her—no bad scheme this; I think, a very good one." But I will not be in a hurry; there is plenty of time. I will take to myself the advice I wrote to you from Naples, and go to London a while before I marry. I am not yet quite well, but am in as good a way as can be expected. My fair neighbour was a ward of my father's; she sits in our seat at church in Edinburgh; she would take possession here most naturally. This is a superb place; we have the noblest natural beauties, and my father has made most extensive improvements. We look ten miles out upon our own dominions; we have an excellent new house. I am now writing in a library forty feet long. Come to us, my dearest friend; we will live like the most privileged spirits of antiquity.'

He could also get drunk in drinking Miss Blair's health, for that was the name of his princess. But that, to be sure, was the fashion of the age. There are many letters containing little besides the details of this love affair. The lady seems to have penetrated the volatile superficial character of her lover. She never could be brought to the point. Tormented with her coolness, he in one letter congratulates himself on escaping from a coquette, and in the next, has resumed all his former admiration. He thus describes one of their interviews: 'On Monday forenoon I waited on Miss B. I found her alone, and she did not seem distant; I told her that I was most sincerely in love with her, and that I only dreaded those faults which I had acknowledged to her. I asked her seriously if she now believed me in earnest. She said she did. I then asked her to be candid and fair, as I had been with her, and to tell me if she had any particular liking for me. What think you, Temple, was her answer? "No, I really have no particular liking for you; I like many people as well as you." Temple, you must have it in the genuine dialogue.

'Boswell. Do you, indeed? Well, I cannot help it; I am obliged to you for telling me so in time. I am sorry for it.

'Princess. I like Jeany Maxwell (Duchess of Gordon) better than you.

'B. Very well; but do you like no man better than me?

'P. No.

'B. Is it possible that you may like me better than other men?

'P. I don't know what is possible.

'(By this time I had risen and placed myself by her, and was in real agitation.)

'B. I'll tell you what, my dear Miss Blair, I love you so much that I am very unhappy if you cannot love me. I must, if possible, endeavour to forget you. What would you have me do?

'P. I really don't know what you should do.

'B. It is certainly possible that you may love me; and if you shall ever do so, I shall be the happiest man in the world. Will you make a fair bargain with me? If you should happen to love me, will you own it?

'P. Yea.

'B. And if you should happen to love another, will you tell me immediately, and help me to make myself easy?

'P. Yes, I will.

'B. Well, you are very good (often squeezing and kissing her fine hand, while she looked at me with those beautiful black eyes).

'P. I may tell you, as a cousin, what I would not tell to another man.

'B. You may indeed. You are very fond of Auchinleck—that is one good circumstance.

'P. I confess I am. I wish I liked you as well as I do Auchinleck.

'B. I have told you how fond I am of you; but, unless you like me sincerely, I have too much spirit to ask you to live with me, as I know that you do not like me. If I could have you this moment for my wife, I would not.

'P. I should not like to put myself in your offer though.

'B. Remember, you are both my cousin and my mistress, you must make me suffer as little as possible, as it may happen that I may engage your affections. I should think myself a most dishonourable man if I were not now in earnest, and, remember, I depend upon your sincerity; and whatever happens, you and I shall never have another quarrel.

'P. Never.

'B. And I may come and see you as much as I please?

'P. Yes.

'My worthy friend, what sort of a scene was this? It was most curious. She said she would submit to her husband in most things. She said that to see one loving her would go far to make her love that person; but she would not talk anyhow positively, for she never had felt the uneasy anxiety of love. We were an hour and a half together, and seemed pleased all the time. I think she behaved with spirit and propriety. I admire her more than ever.'

He at length considered himself as off with Miss Blair, and at liberty to pay his vows to a pretty young cousin, a Miss Montgomerie, the daughter of an Irish counsellor, who was visiting near him in Ayrshire. What a curious revelation of a human heart! In August, 'I was allowed to walk a great deal with Miss —; I repeated my fervent passion to her again and again; she was pleased, and I could swear that her little heart beat. She promised not to forget me, or marry a lord before March.' This was 'all youthful, warm, natural—in short, genuine love.' Soon after, he learned that Miss Blair was still within reach. He revisited her, and relapsed into the former fever. 'I walked whole hours with the Princess; I kneeled; I became truly amorous; but she told me that she had a very great regard for me, but did not like me so as to marry me.' Then came a kind letter from my amiable Aunt Boyd in Ireland, and all the charms of sweet Mary Anne revived. Since that time, I have been quite constant to her, and as indifferent towards Kate as if I never had thought of her.' The problem came to a solution next year by his marrying Miss Montgomerie.

The cares and responsibilities of matrimony never had any effect in steadying Boswell's giddy course. At five-and-forty, after comparatively falling at the Scotch, he entered at the English bar. The change of position only expanded his indulgences, not his fortunes. We find him confessing that he had all his life been straitened for money. Can we wonder at it in one who made the following of his whims and the indulgence of his tastes and appetites the rule of his life? Poor Boswell! It is melancholy to find that, while preparing his wonderful book, the disappointment of his professional failure, the pinch of genteel poverty, and the rough railery of the Northern

Circuit, all pressed sore upon his spirit. Reared amongst an intemperate set, he gradually became more and more addicted to liquor—was constantly resolving to abstain—but always relapsing. For a long time, he had hopes of getting a government place; looking to parliamentary influence in Ayrshire as a purchase against the minister; but all ended in disappointment. By some influence with the Earl of Lonsdale, he did obtain the situation of Recorder of Carlisle; but it does not seem to have brought an income, and the connection came to a painful termination, the noble lord and his dependant having a violent quarrel, as thus recorded: 'Upon his seeing me by no means in good-humour, he challenged it roughly, and said: "I suppose you thought I was to bring you into parliament; I never had any such intention." In short, he expressed himself in the most degrading manner, in presence of a low man from Carlisle, and one of his menial servants! The miserable state of low spirits I had, as you too well know, laboured under for some time before, made me almost sink under such unexpected insulting behaviour. He insisted rigorously on my having solicited the office of Recorder of Carlisle; and that I could not, without using him ill, resign it, until the duties which were now required of it were fulfilled, and without a sufficient time being given for the election of a successor. Thus was I dragged away, as wretched as a convict; and in my fretfulness, I used such expressions as irritated him almost to fury, so that he used such expressions towards me, that I should have, according to the irrational laws of honour sanctioned by the world, been under the necessity of risking my life, had not an explanation taken place. This happened during the first stage. The rest of the journey was barely tolerable: we got to Lancaster on Saturday night, and there I left him to the turmoil of a desperate attempt in electioneering. I proceeded to Carlisle last night, and to-day have been signing orders as to poor's-rates. I am alone at an inn, in wretched spirits, and ashamed and sunk on account of the disappointment of hopes, which led me to endure such grievances. I deserve all that I suffer.'

What a lesson on the sorrows of slothful dependence, as contrasted with honest independent hard work and self-denial!

The letters of the last five years tell us of little but illness and depression of spirits—a sad contrast to the frivolous gaiety of those written in youth. Boswell sank, to all appearance under the consequences of dissipation, at the too early age of fifty-five (May 1795).

NATURAL HISTORY OF MY POND.

IN TWO PARTS.—PART I.

Not far from my residence is a little sunny pool—not one of those dirty, green, stagnant ponds which breathe pestilence, but a clear bright pool, with a pure stream of water flowing through it, white in the spring-time with flowers of the water-crowfoot, and in summer, gay with blossoms of the flowering-rush and the purple loosestrife, whilst a few water-lilies float like a group of royal bridesmaids on its surface. My Pond does not extend over quite half an acre of ground; on one side it is bounded by a few stunted willow-trees, which bend their boughs gracefully toward it; while on the other, many of the common water-plants grow at the margin, and give occasional shelter to a vagrant water-hen. None of these have, however, to my knowledge, become permanent residents in my pool. Though my domain is not extensive, yet it is to me a perfect vivarium; and, in gratitude for the pleasure it has often given to me, I have determined to write the story of its inhabitants; not the occasional rarities, but the well-known familiar faces who may always be met with in the right

times and seasons. It must be only a very slight sketch, though a folio volume might be written on them; so this little memoir must be taken by the reader rather as an introduction, a card allowing him to call and make the acquaintance of my friends at his leisure.

Firstly, there are giants in the pool—there are vertebrate animals, quadrupeds, reptiles, fish. Of the fish there is not, indeed, much to say; it is difficult to see much of them, and the only approach to familiarity between us is when a carp rises to take a crumb of bread thrown upon the water for him. There are, besides, the minnow and the common stickleback; and a legendary story exists of a pike having been seen there, but this is not given upon good authority, and the splash witnessed by my informant was more probably caused by a water-rat diving from the bank. Of the fish, the one which to me possesses most interest is the stickleback, the male becomes such a beau in spring-time; and, besides this, they have more wit than fish in general, for the female does not leave her eggs to the chance mercy of the winds and waves, but builds a nice compact little nest amongst the water-plants; and over this the male keeps watch, as a good and true husband should, and no water-beetle or dragon-fly larva dare venture within his reach: he is ever ready, lance in hand, to do battle with all comers.

Great favourites of mine are the newts, both the larger and smaller species. Gorgeous fellows are the males in their wooing-dress, with their orange breasts and crested backs; and very amusing are they to watch. One of these Adonises of My Pond may be often seen escorting some fair dame, and shewing his agility by every means in his power, doing his utmost to make himself agreeable; and when the nuptial-time is over, the interest does not cease, for the offspring also are much to be admired: they are not, like the vulgar tadpoles, pertaining to the toads and frogs, but evidently an aristocratic race, adorned with large feathery branchiæ, fringing their necks like those goodly collars that were worn by our great-great-grandmothers in the glorious days of Good Queen Bess. Frogs and toads are there also; the former jump nimbly enough into the pool at my approach. Poor beings! they seem to have been made for the physiologist as sheep for the butcher; and it is to be feared that mine are not always safe from this their usual fate; yet the supply never fails, and in the spring the pool is ever musical with their love-notes: the first sounds which tell us of the coming of warm weather. However unpoetical such an opinion may be, it is yet true that these tender murmurings of the frogs are the earliest harbingers of spring; they are heard long, long before the swallow, before even the wild-bee and the primrose make their appearance; and the snow-drop is rather the offspring of winter than the promise of its departure.

But there are higher vertebrates dwelling in My Pool than frogs and newts; the splash of the water-rat as it leaps from the bank may be heard frequently; and if you watch, the furrow on the surface will soon point him out, dimly visible, immersed beneath the water, yet swimming along bravely; or he may be seen, when he has gained the opposite bank, making his way stealthily up to his hole. But the name of rat, like the idle gossip of a country-town, sticks to him; and though he does not deserve it, and the rat of the town bears little relationship to the rat of the country, yet it prejudices him in the eyes of all, and it must be confessed, he is no favourite of mine. There is another little animal which ranks especially high in my opinion; he comes gently down from the bank towards the evening, and begins his aquatic sports, looking, as he swims in and out amongst the water-lily leaves, not unlike a great water-beetle; but the glossy hair glistening with air-bubbles will soon detect him, and his

sharp muzzle marks him to be a shrew-mouse. By keeping perfectly quiet, you may watch his gambols for a long time—now swimming on the surface, now diving beneath it, or sporting among the water-weeds. There is nowhere to be found a more engaging animal than this little shrew: he is one of the greatest ornaments of My Pond, or rather, it should be said, they are, for there are generally a pair to be seen playing together. Nor is it, indeed, always play, for the earnest way in which they push their long snouts amongst the water-plants shews that there is a purpose in their movements. No wonder they are favourites of mine, for they give me much amusement in the calm summer evenings. The shrew used to participate in the ill-feeling that appertained to 'witches, warlocks, and all lang-nebbit things,' and the land species was deemed the cause of many an evil by our simple ancestors; but our amphibious friend was probably then unknown.

It is not, however, vertebrate, but articulated or jointed animals which My Pond yields in the greatest plenty. It is easy to obtain several species of the crab-kind, or crustaceans, two or three spiders, very many insects, and several of the less-organised examples of the group. Of the crustaceans, the most conspicuous example is a small shrimp (*Gammarus pulex*), looking like a sandhopper. He need scarcely be described, for every one must know him, as he is probably a denizen of almost every pool in the kingdom. He is active, and chases about the smaller animals in a relentless manner; and he may boast, also, of being my largest crustacean, for the others are much smaller, scarcely exceeding a pin's-head in size. The commonest of these (*Cyclops quadricornis*) is known easily by the two egg-bags which the female carries by the side of her tail. No wonder that this species is abundant, for Jurine calculates that at the end of one year a single female would have become the progenitor of 4,442,189,120 young! And this is probably too low an estimate. The young are produced in a state very unlike the parent, and it is some days before they assume the adult form, the time changing with the warmth of the weather and with the light admitted to them. The specimens found in My Pool vary much both in colour and size; some are black, others olive-green, whilst the most frequent are of a yellowish white. They are very active, and move deftly through the water, but may be easily seen with the naked eye. Under a common magnifying-glass, all their parts can be distinctly noted, and especially the peculiarity which has gained them their name—the fact of their having only one eye. There is another species (*Daphnia pulex*) rather larger than this, which may be often seen in swarms among the water-plants, especially in sunny weather. All of this little being, except the head, is enclosed within the valves of a delicate shell; these valves have no hinge, but are open in front, and simply soldered together along the posterior edge; the animal possesses, however, some power of opening or shutting them at will: this is the water-flea, a merry, harmless little being, having of course no right or title whatever to the name of flea, except for its activity. Donovan gives an amusing, though very unfavourable account of it: he says, 'by numerous filaments which it darts forth, it causes such a motion in the water as to attract unresistingly the insects floating into its mouth. Thus it exists in a life of rapine and destruction, enjoyed at the expense of the lives of thousands; and as the objects of its ravenous disposition are defenceless, so are they the sport of their conqueror. The few moments of intermission its craving appetite grants them are occupied equally in the spoil, first pressing them to death, and then tossing them undevoured into the fluid. But should a more powerful insect oppose him, he immediately contracts his parts, and nothing more than the external covering is open to his antagonist's violence, and he will sooner die ignobly than offer the least opposition!' There is a curious

provision with regard to the multiplication of this little being: the female lays two kinds of eggs—the one in summer, which soon produces young; but the other just before the approach of winter. This lies for some time upon the back of the animal like a saddle, and has hence been called the ephippium; it contains two eggs. These are able to resist the cold of winter, which is fatal to the perfect animal. 'This ephippium floats on the surface of the water, and remains with the two eggs enclosed till next spring, when the young are hatched by the returning warmth of the season.' These two kind of eggs shew that the preservation even of the most insignificant of beings is abundantly provided for. There is in the pond a far prettier species (*Cypris vidua*) than either of the two mentioned. Draw a plant of callitriche to land, and there will probably be found a specimen of this little crustacean entangled in it. It has a shell very much like that of a bivalve mollusk, of a white colour, with a slight tinge of green, and on this shell are three black stripes. It not only swims with great activity, but runs actively along the leaves of the water-plants, or along the bottom of the pool. The shell differs from that of the water-flea before described in being open, except in the middle third of the dorsal surface, where there is a true ligamentous hinge and muscles, by which the animal can open or shut the shell at its pleasure. In appearance, it much resembles a very small muscle, but of course can be known at once from any bivalve shell by its movements and by its four legs. There is more than one species of this elegant little shell in My Pond; but the one described is the most frequent, and also the most beautiful. We shall finish the 'first fyte' of our history with it, and commence the next with the spiders.

The only species of spiders which My Pond contains all belong to one genus (*Arachnida*); they seem like overgrown mites of a reddish-brown colour (*Hydrachna globulus*), and about the size of a sweet-pea seed; but they are rapacious enough, and undergo, in the early stages of their life, some strange metamorphoses. Being then parasitic upon the large water-beetles, they are rather amusing to keep and watch, from the variety and agility of their movements. Their respiration is, like that of insects, by air-tubes, which ramify in the body. Of the ordinary pulmonary or lung-breathing spiders, My Pond has no example.

Next to these come the insects, and of these, firstly, the beetles; and here it is not possible to enumerate one-quarter of the examples of this tribe found in My Pond. Size gives the precedence to the Dytisci (*Dytiscus marginalis*)—large oval beetles, nearly two inches in length, of a bronze-black colour, but light-brown on the reversed side. They may be always seen swimming among the water-weeds, urging themselves on by the aid of their powerful hind limbs, which they use as oars. I kept one of these for a long time. During the day, he remained quietly in the water; but at night, he would make excursions round the room, and seemed to have a particular penchant for flying in the faces of those who entered his apartment. He was fed upon wasps, and on these he thrived well, until one day a specimen not quite dead was put into the vase in which he lived, and he was stung, and died in consequence. Curious beings are the larvæ of these water-beetles: they have six legs at the front-part of a long fishlike body, and the odd, flat, square head is armed with powerful jaws. They swim rapidly along by aid of the tail, and are, like the perfect insect, very voracious in their habits. Besides these larger water-beetles, there are many of lesser size, some extremely like the Dytisci: these are Colymbetes; and there are several species in the pond. There are many other genera; but space will only allow us to notice the whirligig-beetles (*Gyrinus natator*). These are probably

familiar to all lovers of angling; indeed, they have gained a classic fame through the mention made of them by old Izaak Walton. On the surface of the pond they are to be always seen, dressed in shining blue-black coats. They keep up a constant quadrille, making their ball-room out of some quiet little bay in the pool: there is one spot especially, fringed by rushes, and with a large pond-weed shutting it out from the external world, that they seem particularly fond of. It is very pleasant to watch them. They are the idlest beings in My Pool, the veriest triflers in existence, dancing away all their lives; and yet other beings might more easily be spared from my aquarium than these merry whirligigs.

The dragon-flies, and the species allied to them, must be noticed next to the beetles; and though it must be confessed that they do not live in the water during their adult life, yet they haunt the pool so much that it is perfectly just to class them as denizens of it. The flies themselves must be first described. There is one of a sky-blue colour, with only a few rings of black; its body is scarcely thicker than a large pin, and its wings are of the most delicate gauze (*Agrion furcatum*). Surely there is nothing dragon-like in this. The French term them, with far more politeness, *petites demoiselles*. There is another species (*A. minium*) much like this in figure, but with the body of a deep-red colour; and there is a third kind also common here, smaller than these, with a body nearly approaching to black, except a single broad band of blue near the tail (*A. zonatum*); this is a very common, but a very pretty and delicate little dragon-fly. One of the red species has just vindicated its title to the name by seizing on one of the little brassy green flies (*Dolichopus aneus*) so frequent on the herbage by the pool. It has borne him off safely to the leaf of a water-plantain, to devour at leisure. Let us leave him in quiet possession of his meal, and take a walk round by the willow-trees; we shall not fail there to find another species (*Calepteryx virgo*), with a body of glossy purple, and dark purple wings, the lady being, however, green, and with wings of a more sober brown colour. This is one of the most lovely of our native species; not very active, however, flitting rather than flying from leaf to leaf, and rarely taking long flights. There is one larger species (*Libellula depressa*) also, which must be noticed, whose habits are the very reverse of this. It may always be seen at the pool on a sunny day in summer. The body is of a slaty-blue colour, and flattened; and the wings, though transparent, are shaded with dark-brown at the base. This is a perfect tyrant, darting round the pool with the speed of lightning, and having the swiftest flight of any of the dragon-flies. He lords it over the whole pool, only settling just for a moment on some decayed twig or broken bough at the water's edge, and then, probably, because he has made a capture of some unfortunate victim. He makes his prey not only on gnats and lesser flies, but on caddis-flies of large size, or even on a wandering butterfly. Other dragon-flies come as occasional guests; but these are true inhabitants, and may always be met with. The interest is not confined to the perfect fly, for they can easily be caught in their previous stages of life, which gives them more than ever a right to claim the citizenship of My Pond, for this early life is passed beneath its waters. The larva is a busy, active, and rapacious creature, propelling himself forward by sucking water in at the tail, and then forcing it out violently: this answers the double purpose of supplying his system with the oxygen from the air dissolved in the water, and of forcing him onwards. The pupa is chiefly remarkable for the jointed lower-lip which is used to take its prey in the manner of a hand, and which covers the face like a mask. It is like the larva, active and voracious; but before its final change, comes out of the water on one of the

broad leaves of the plants near, there casts its slough, spreads its wings to the sunshine, and flies off as one of the glorious beings we have been watching. See! this burst of evening sun has brought out one of the flat-bodied species we were talking of just now: he has settled for one moment, with outspread wings, on the summit of one of the flag-leaves; now he is off again, darting round the pool; his supper does not 'yet run a-foot,' but it is flying somewhere, and has to be earned before he can get it.

We will now turn to the more peaceful ephemera or day-flies. Poor creatures! their perfect life is but a brief one. There are in the pool more than one species, but the commonest is a large fellow (*Ephemera vulgata*), a bashaw of three tails, and with curiously mottled wings. He dances up and down for a few hours in the summer evening, and the next morning you find him with outstretched wings floating on the pool. Has my reader ever been to the Rhine in summer?—he will then know well what an ephemeron is. As soon as evening comes, myriads of a snow-white species of these *wasser-fliegen* haunt you everywhere; incessant swarms pass by you on the steamers, so that you always seem sailing through some long cloud of flies. They come to your lights in swarms, until literally heaps of them lie dead upon your table; they are in your tea, in your milk; your butter is covered by a delicate layer of them; they are everywhere; turn where you will, you are surrounded by these emblems of the frailty of life. Our ephemeron often dances in merry groups over the water; but swarms like these are quite unknown. The larvæ of these flies are very beautiful; the tufts of branchiæ, or appendages for breathing, which are arranged down each side, are most elegant in form, and in constant play. They are best met with in the spring-time. Like the dragon-fly, the pupa comes out of the water to undergo its change; but even when the perfect insect appears, it is for about an hour clothed with another tunic, which has to be cast off before it is quite complete.

Nearly allied to these, we have the group of caddis-flies. Their wings are four, covered with hairs instead of being gauze-like and transparent. We shall not fail to find some species on the stumps of the willow-trees. The commonest of the group is a large brown fellow (*Phryganea grandis*), with long antennæ. We have many species on the pool. The larvæ are always to be found; they construct for themselves cases, made out of fragments of stick and sand, open at both ends. They walk along the bottom of the pond in rather an awkward manner, carrying their houses on their backs, into which they retreat in case of danger. Some of the cases are constructed with great regularity. There are many species inhabiting the pool, but the one mentioned is certainly the commonest.

Look! here is one of the next tribe (*Hydrometra*) which must fall under our notice. He glides over the surface of the water as quickly in proportion as any six-oared gig in a boat-race; his body is pointed before and behind like a London wherry; and his two middle legs urge him on much as a pair of oars would do. There are more than one species in the pond. Their gambols are very amusing, though there is a degree of awkwardness in the movements of their long legs. Sometimes they attempt a dance, as the whirligig, but they have not the same graceful ease in their movements; sometimes, but rarely, they are provided with wings.

Belonging to the same group, but to a different section, are the water-boatmen (*Notonecta glauca*). These always swim upon their backs: they rest on the surface of the water, or rather with their tails at the surface, basking in the sunshine; but let your hand approach, and a stroke of their powerful oars takes them away speedily amongst the water-

plants. They are very amusing beings—in the daytime swimming about the pool, in the night, making aerial excursions into the neighbourhood. Nearly allied to these is the brown water-scorpion (*Nepa cinerea*), so called from its anterior pair of feet bearing a very distant resemblance to the mandibles of the real scorpion, to which, it need scarcely be said, it bears no true relationship.

There are some moths even which must be claimed as citizens. If one of the floating pond-weeds be drawn to the banks, we shall not fail to find on it a number of curious shields cut out of the leaf, oval in shape, and looking somewhat like the case of the caddis-fly. These (*Hydrocampa potanogota*), which thus pass their lives in these little tents, come out in July as the pretty moths commonly known by the name of China-marks, from their wings being marked with a curious and beautiful pattern of a brownish-yellow colour. There is another species to be found upon the water-lilies (*H. nymphaea*); and another, still commoner, which makes a long cylindrical case out of the fronds of the lesser duckweed (*H. lemna*).

The only remaining insects which can be said to be true natives of the pond, are a few two-winged flies; and of these the gnats are the species which have the most right to the privileges of citizenship, since, like the dragon-flies, their early life is passed in the water. There are abundance of kinds which haunt the margins: these are only guests; but the gnats live there by far the greatest portion of their lives. It is curious to see the female deposit her eggs: she alights carefully and steadily upon the water, and, guiding herself by the hind feet, builds a perfect little canoe of eggs, which floats off upon the surface of the pond; and sometimes a large fleet of these may be seen sailing along together. From these the well-known larva emerges; this breathes by its tail, and therefore is often to be seen head downwards, suspended at the top of the water. The pupæ have not legs like those of the dragon-flies, and therefore the change takes place in the pond, the insect emerging from its shell as it floats upon the surface: this requires great caution, and is a period of great danger to the insect, a passing breeze often consigning many to a watery grave. Myriads, however, still exist, and are, it must be confessed, rather troublesome friends, being frequently too kind in their attentions. With them, the account of my insect acquaintance must be concluded, hoping my reader may be preserved from their attacks, whether as gnats or mosquitoes, until we meet again.

MATRIMONIAL CORRESPONDENCE.

THE art of getting married is practised in many different ways in different parts of the world. This statement, admitting of no dispute, need not be illustrated with examples. I will not detail to a well-informed public, whose ear has been bored, figuratively speaking, with numerous particulars of the same kind, the manner in which the Cingalese and the Chinese, and other hes, take wives unto themselves. It is generally known that, among barbarous nations, and occasionally among some that are not barbarous, the marriage-ceremony is but the clenching of a bargain, the arrangement by which certain goods—item one bride, item one marriage-portion, &c.—are assigned and delivered over to the purchaser. It is also to be gathered from the pages of history, that the same ceremony, performed between royal personages, has been more frequently an alliance between nations than individuals, a *gage*, not so much *d'amour* as *d'amitié*; that the daughter of a royal house has been sent as a peace-offering to a dangerous neighbour, and that the fair hostage has received the title of queen with the name of a wife, her position being less fitly represented

by the golden circlet on the finger, than by that on the head.

These are subjects on which, as a moralist, I conceive that the less said the better. Nor will it be considered that the art of getting married, as practised in our own country, requires much elucidation. Much learned disquisition and many bad jokes have been brought to bear upon that question. I refrain from venturing on a topic which has been elaborately treated of in various works in three volumes. But the art is now practised elsewhere in a manner so entirely distinct from former experience, that it seems to claim a little attention.

The method in question has lately come into use in America, and is intimately connected with the discovery of photography. There is an illustrated periodical published in New York, called the *Ledger of Romance*, which allots a portion of its space to what is called 'Matrimonial Correspondence.' Under this head, ladies and gentlemen who desire to enter into the bonds of wedlock, insert descriptions of themselves and of the paragon they are in search of. Occasionally a portrait is sent—usually a photograph—which is engraved above the description. Sometimes a name is given, but more commonly an initial, the address being confided to the editor, who 'mails' all letters, sent by way of reply, to the respective parties.

It may be said that this is only a variety of the matrimonial agency said to exist in Paris, and not entirely unknown in our own country. There is, however, this important distinction between the two—that whereas in France the negotiation is conducted with some degree of privacy, and is known only to the persons interested, or supposed to be so, in America the candidate publishes his offer to the world at large. It is not very difficult to imagine how the system is found to operate. Cœlebs, who goes little into society, or whose tastes are fastidious, takes up this valuable paper, say at breakfast, and straightway his eye falls upon that pink of perfection which he has sought for in vain. The hand, with its piece of buttered cake, is stayed on its way to his mouth, he bends eagerly over the description, his coffee perhaps grows cold, but no matter—he thinks she would suit him! Presently he draws up an account of his own advantages, and forwards it to the editor. Perhaps a photograph goes with it; but engraved portraits do not admit of being highly coloured, while those of the pen do: usually, therefore, he prefers the latter. The rest is darkness and silence. The imagination of the uninitiated reader must supply the dénouement. In the observation of scientific phenomena, we note effects the causes of which are frequently concealed, but in this experimental philosophy of matrimony, the causes lie on the surface, while the effects are left to conjecture.

The 'gentlemen's department' of this correspondence is likely to be the more amusing to the general reader, shewing as it does the several candidates to be possessed of every merit, except perhaps that of modesty. If we may take the various statements *au pied de la lettre*, we shall be surprised to find men of all ranks and very different ages coming forward to find wives. In the number which I hold in my hand, one column is appropriately headed by a military officer, whose portrait represents him in full costume, and who is introduced by the editor with the following flourish of trumpets:

'Col. T. B. M——e has called at our sanctum with one of Brady's best photographs of himself, and begs that we will present his claims to the fair readers of our paper as a candidate for matrimony. We know the colonel intimately, and can say, that although a few hairs of iron-gray are sprinkled among his raven locks, yet they were caused by exposure among the glades of Florida, and the well-fought fields of Mexico, where he distinguished himself by his valour, and are not sown there by years, for he is but thirty. He holds

a commission in the U. S. army, and his family is one of the oldest in the country. His youthful escapades are pretty generally known among his acquaintance, and hence he is looked upon with some distrust. But we know him to be the very soul of honour, and have advised him thus publicly to confess the error of his past ways, and throw himself upon our fair readers' mercy, in the full confidence that some bright eye may be captivated by his manly beauty, and love and marry him.'

The reason given for the colonel's public appeal is rather novel, and it may be doubted whether the fair readers of the paper would be disposed to extend their pity to a man who is in such bad odour with the ladies who know him, as to be compelled to seek a wife among those who don't.

Next appears the portrait of a gentleman whose hair has been singularly well curled by the artist, and who introduces himself in rhyme:

To all fair ladies who may view this page,
A gentleman of six-and-twenty years of age
Politely begs to make his wishes known.
He would not live—or rather—live alone.
His form and features let the portrait tell,
On these his modesty forbids him dwell.
He needs a lady with a pretty face,
A modest fortune, and a winning grace,
A temper suited to an honest mind,
Which to her slightest wish shall be inclined.
A mercenary wretch he may be branded,
But his best wishes are to be most candid:
She must have money; though indeed at present
He fears no poverty, still 'tis not pleasant
To dream or think a day of want may come
To the young lady whom he leadeth home.
And yet to prove no sordid ends combine
To make him pen the seeming selfish line,
He hereby covenants, agrees, engages
To settle on herself and the sweet pledges
Of her affection, all that she may own,
And asks for *his* love but *her* heart alone.

GUSTAVUS EDWARDS.

The ladies will hardly fail to appreciate the charming air of candour, which, like a transparent varnish, shines over this announcement. To dread that 'a day of want may come to the young lady whom he leadeth home'—what could be more amiable, more considerate?

The next correspondent describes himself as a merchant doing a successful business, and alludes to his affairs by asking, 'what a paltry 8000 dollars a year can be to the great house of A——n Brothers & Co.' (the lady he is addressing being in possession of that sum). Then we have an author who candidly says that 'his fortune may be best expressed by an indefinite number of ciphers, with the unit at the left' (meaning the right probably). If, however, he spends his money, he works for more, and has enough to afford a wife every comfort.

Many of these applications appear to be unavailing; nobody comes to be married, nobody comes to be wooed. Others are more fortunate, and I observe one case in which a candidate receives more than one reply. A certain Mr George Hubbard, who describes himself as a widower, and whose portrait represents a pleasant-looking man of middle age, says he would be glad to marry again. Next week, two ladies send their portraits and compliments to him, which are duly presented in the journal. The contrast between the fair rivals is very striking. The first, with the signature of a 'Strong-minded Woman,' describes herself in these terms:

'I am possessed of little sentiment, and do not believe in love in a cottage, and think pork and beans are more necessary to human existence than moonlight rambles or serenades. I am unable to boast of numerous

conquests over the gentlemen, but assure you I am none in making pumpkin-pies. I do not understand the glorious art of painting, but my whitewashing will surpass competition. My modesty will not allow a description of my personal appearance, but I will say that I have neither red hair nor freckles. Wishing my various accomplishments may suffice, I beg you will address

STRONG-MINDED WOMAN.'

The second writes in a strain so simple and sincere, that anywhere out of print I should call it charming:

'MR HUBBARD—I notice in the *Ledger* a picture of yourself; it pleases me exceedingly. I would be happy to open a correspondence with you.

'My age is twenty-two. I don't know how you would be pleased with me, but I truly wish you might, for I feel a deep interest in your picture. I should be happy to write further particulars.—Affectionately yours,

JENNIE WIGGERS.'

The portrait which accompanies this letter gives a very favourable representation of the writer, but it produced no effect. The ladies may be interested to know that the pumpkin-pie carried the day, and that next week Mr Hubbard wrote a long reply to the Strong-minded Woman, in which he congratulated himself on his good-fortune in having attracted her notice.

The question what the ladies like must always be of deep interest to a large majority of the other sex. That question—the difficulties of which have hardly been diminished by the imaginative powers of writers of fiction—is to some extent elucidated in this correspondence. If any confidence may be placed in the evidence, it appears that prospective husbands are not required to have money; wit is seldom wanted, and good looks can scarcely be said to be at a premium. An amiable disposition is indispensable, and so is youth; a good family very desirable; a manly and honourable nature much in request. Those qualities are required which, in America as here, are comprised in the emphatic word *gentleman*. Tobacco is in general objected to; but cigars, if required, are tolerated. Surely the age of chivalry is indeed gone, when a lady is compelled to endure the 'weeds' on taking a husband, as commonly as to wear them on losing him.

The gentlemen are much more fastidious; one and all of them want something very nearly angelic. They usually take credit to themselves for magnanimously relinquishing some one attribute of perfection. Books on female education condemn the pursuit of surface accomplishments in preference to the more solid acquirements which are really valuable to the mistress of a household. It would appear, however, that the latter are attractive rather to persons of the age of Mr Hubbard, than to younger men.

One young lady, of the interesting name of Lola, appears to have advertised herself in a sheet we have not seen, and to have met with very considerable success; the editor informing her that he had mailed four letters to her this week, keeping back the rest 'because the writers neglected to pay the postage.' Lola exposed her portrait to public competition, and here is in one case the result.

'CHICOPPEE, July 1856.

DEAR SIR—Last week, while perusing your *Ledger of Romance* for August 2, my attention was attracted to a very beautiful picture of Miss Lola C—I of Springfield, Mass. Her picture strikes me exceedingly, and should like very much to cultivate her acquaintance with a view of matrimony. I am a young man twenty-two years old, and most exemplary character; my figure is good, five feet nine inches in height; hair and eyes are black; I am considered handsome by most of the young ladies. I am of good family, and have a good profession. With respect to matrimony, I have always considered it the only thing necessary to complete a man's happiness on this earth, and would most

readily with her enter that state of bliss.—Yours with kind regard,

DANIEL RAYMOND, Chicopee.'

Another gentleman of the same age is also taken with Lola's picture, and would be happy to make her acquaintance with a view to matrimony; but he adds—or the acquaintance of any other young lady. His chief object is to find a conjugal companion for a tour in Europe.

All this may be amusing to read about—and I hope it is—but in practice it wears a very different aspect. It will not do to judge the manners of a distant though kindred people by our own standard of unconquerable reserve; but the custom of wearing one's heart not on one's sleeve, but in the morning paper, can hardly be regarded in a very favourable light. The purity and delicacy which encircle with a glorious halo the head of young womanhood, seem somewhat imperiled by a process which is little else than a public auction. Even the fortunate man who in personal qualifications outbids his competitors, cannot reflect with much satisfaction on the fact, that she who sits by his side has been the subject of public advertisement. If Cælebs cannot find courage to pay his addresses to a lady in the ordinary way, it would surely be better that he should pay his court like Window Wat, without the door, than through the newsmen.

EMIGRATION TO AMERICA MADE EASY.

THE difficulty an emigrant from Europe finds is not in getting to America. The middle-passage has no horrors for him; but no sooner does his foot touch the soil of republican freedom, than his progress is arrested, and if he should have the good-fortune ever to reach his destination at all, it is not till loss of time, money, and peace of mind has left him half frantic and half a beggar. We are now of course alluding specially to the more ignorant class of emigrants, and to the system of private swindling of which they are the victims; though all classes find more or less difficulty and delay in reaching the part of the continent they are bound for: we are alluding to what the *Toronto Colonist* calls 'the monstrous villainies practised upon emigrants at New York, New Orleans, and other ports—villainies which have hitherto baffled all the ingenuities and all the energies of the many humane societies which have sprung up in New York and other places to protect the unsuspecting and friendless emigrant.'

This great evil, however, from present appearances, seems about to cease; for the acute mind of Mr S. P. Bidder, the general manager of the Grand Junction Railway of Canada, has seen the malignant influence it would exercise against that noble work, and against the tide of emigration to British America. He has devised a plan of *through-booking* in the great seaports of Europe, by which the emigrant, or traveller, will take his ticket at once to the place of his ultimate destination on the American continent, and will thus avoid the risk of being fleeced or trepanned in the port where he arrives. 'Agreements have already been made by Mr Bidder, with all the leading railways of the United States, by which passengers, whether emigrants or otherwise, will be passed to any part of Northern and Western America upon tickets issued to them in Europe. Thus, passengers who purchase through-tickets from the agents of the Grand Trunk Railway at Havre, Antwerp, Rotterdam, Bremen, and Hamburg, as well as at Liverpool, Hull, Glasgow, Aberdeen, Belfast, Dublin, Cork, Galway, or any other port which trades with Boston, Portland, Quebec, or Montreal, will be conveyed to any point in Canada to which a railway runs, or to any place in the United States where a leading railway has a station, without the trouble of making even an inquiry, or the delay of a single unnecessary moment. Each passenger will be supplied with a ticket—authenticated by the

signature of a duly authorised chief-officer of the Grand Trunk Company—a map of his route, and even a timetable, which, while he will be secured against all imposition, vexations, and delays after he lands, will tell him almost the very hour at which he will arrive at his destination.'

There can be no doubt that this extensive project is one of the greatest utility, and that, if properly carried out, it will have important effects upon the emigration from Europe to America. The Toronto paper, however, looks specially to the Canadian share of the benefit, and not, we think, without cause. 'We need hardly point out the advantage to Canada of the best class of emigrants being conveyed upon its railways, and in view of its splendid soil and settlements. Even supposing that a large number will have made up their minds to go to the far west, many—and these the most wealthy and valuable—will determine to settle where comfort and civilisation mark the people, and the soil and climate unexceptional. It need hardly be said that the whole face of Upper Canada is one wide advertisement of such characteristics. The farmhouses, the fences, the stock, the villages, the churches and school-houses, the horses and carriages, and the dresses and well-to-do appearance of the Canadian agriculturists, speak at every turn, in favour of their country to every man who desires a comfortable residence for himself and a future home for his children. So that, apart from the emigrants who may come with the direct intention of settling in Canada, we are sure to get many who, not understanding America, or probably with mistaken notions of the British provinces, may have determined to settle elsewhere. The through-ticket system will, in short, allow Canada to advertise herself; and she wanted no better advertisements at the London and Paris Exhibitions, and will require none better to the intending settlers of North America.'

Sir Cusack Roney, the secretary of the Grand Trunk Company, is co-operating with Mr Bidder in the European part of the arrangements; and when all is ready, in addition to his present duties, he will retain the superintendence of the through-booking system. If judiciously carried out, as we doubt not it will be, the best results will follow for all parties. The benefit will not be confined to Canada. By the system of railways now in full operation, emigrants can be carried direct from Quebec, or from Portland in Maine, to the banks of the St Clair in the extreme west of Canada, and thence pursue railway routes through Michigan to Wisconsin, and other attractive places of settlement in the north-western regions of the United States. In short, in a day or two after landing on American soil, and with no kind of trouble, the emigrant will find himself at his new home. Such a prodigious convenience, robs emigration of its terrors, and must set hundreds of timid families wandering. As the notices of this through-ticket system will probably excite inquiry, we recommend that the authorised places for procuring tickets should be made well known by advertisements.

THE FUGITIVE SLAVES.

OUR wrongs were countless as the sands
Of that dread soil whereon we stood :
With thongs they bound our plighted hands,
They scourged us—even to blood ;
They smote our first-born midst his play,
They seized and sold him far away.
I looked upon his mother's face ;
'Twas blank as is a starless night
When the round moon has left her place,
And there is no more light ;
And cold upon her blighted cheek
Lay the strong grief she might not speak.

I said : ' In yonder dreary swamp

Afar shall we two hide our wo ?'

Then first her eye with tears grew damp,

She said : ' My love, we'll go ;

For thy lost sake, my child, my child,

We'll go and madden in the wild !'

We had no home from which to part,

As through the blooming rice we stole ;

Our home was in each other's heart,

And in the God-sent soul

Which dared the wrath of man to brave,

Though groaning in a tortured slave.

The long night-shadows veiled our flight

As, breathless, we pursued our way ;

But dreadful as the white man's sight,

So dreadful was the day :

If God's blest light our path revealed,

Too well we knew our doom was sealed.

And daylight broke : the hunt was up !

We caught their shouts upon the gale ;

And we must drain the bitter cup

If once our limbs should fall :

Delirium in our every tread,

For life—for death, on—on we sped.

The swamp was gained ; and, crouching low,

We dared to breathe the poisoned air.

Behind us, stretched a waste of wo ;

Before, the wild beast's lair ;

Yet paused we now, or shrank we back,

The Cuban dogs were on our track !

Beyond, upon the thicket's verge,

A lake of stagnant waters lay :

We plunge ; our fainting limbs we urge ;

We cleave the watery way.

Less than the white man did we dread

The alligator's slimy bed.

A strange relief our bosoms crossed :

The terrors of pursuit were past ;

In the dank ooze the trail was lost,

And we were safe at last—

Safe !—midst the horrors of the brake,

The mockeson and the rattlesnake !

I had no fears ; the bitter flood

Of wo had drowned each life-born care ;

And one beside me breathed, who stood

Between me and despair ;

Though that keen anguish which she bore,

Had passed not, shall pass never more.

It seems to bear a spell which holds

The fiercer monsters from their prey :

The serpent with his coiling folds

Will shrink and glide away ;

Her eye each deadlier reptile charms,

And I lie safe within her arms.

And we are free !—free ! God in heaven

Who caused that word to sound so sweet,

Save those to desperation driven

Beneath the white man's feet ;

Who makes, to mar Thy glorious plan,

An outcast of his brother-man !

E. L. H.

'A TILT AT MR GOSSE.'

MR P. H. GOSSE does us the honour to write in reference to an article in our number for October 11, 1856, in which some particulars of an anecdote of the killing of a crocodile, given in his *Naturalist's Sojourn in Jamaica*, are called in question. We do not think it necessary to print Mr Gosse's letter or the documents he transmits to us, but content ourselves with remarking, that he has adduced what seems fair evidence of the correctness of the principal facts reported in his narrative.

MY NIGHT IN THE HOUSE.

A MAN with a wife and eleven children farming some of his own land, with a little house-property to look after, besides being guardian of the poor, parish vestryman, and perpetual chairman of the Anti-county-rate Movement, has quite enough on his hands to keep him at home. But my country—or rather my county—called me, and with the spirit of an old Roman, I resigned myself to my duty.

It happened in this wise. The supply of gas to our town had been for many years a disgraceful monopoly in the hands of the old company, as it was called. Last year some patriotic citizens, of whom, without vanity, I may say I was one, projected a new association for the purpose of providing Trixbridge with the means of illumination. Everything was done properly and in order. We issued prospectuses, held board meetings, allotted shares, and presented a bill to parliament for the 'Grand Trixbridge Gas, Coke, and Railway Company.' Of course, our bill was opposed tooth and nail by the old monopolising company. When the time came for parliament to decide upon the controversy, I was invited to bear testimony on our side of the question. As the new company intended to buy some of my land, and rent some of my houses for their works, I was naturally well qualified to speak of the excellence of their plans and the indescribable advantages which the bill would confer upon Trixbridge. There was another point. Mr Aspinall, the buff member for our borough, was suspected of favouring the old company. Now when he came down for his election, the honourable member—he was really an honourable—and myself were on the most friendly terms. So attached, indeed, had he shewn himself to me, and so domestically delighted with the society of Mrs Burtonshaw and our family altogether, that I had not only voted for him myself, but had contrived to secure him the votes of two sons, three nephews, one brother-in-law, and half-a-dozen electors with whom I happened to be connected in business. Our board, therefore, thought that if I were on the spot, and put the matter in a proper light to the honourable member, he might be induced to help us forward with our bill.

Thus it was that, after much solicitation, for the good of my country, I came up to London. There I stayed some weeks, passing much time in the committee-room of the House of Commons, but also not omitting to visit every place which was mentioned to me as worth seeing in or near the metropolis. My various observations upon these tours of inspection are far too numerous to be here related. On the whole, I found the journey very pleasantly, even though away from

my home and Mrs Burtonshaw. Everybody was exceedingly polite. My accommodations were excellent, and, what I had not expected, the eatables and drinkables supplied by the London hotel-keepers, really not amiss. About their cost, I am not able to speak, as the company paid the bill; but I never heard of any complaint on that score.

As for the other bill, the expectations of the board were completely realised. The Honourable Mr Aspinall, after a little conversation with me, shewed himself really enthusiastic on behalf of our project. 'The Grand Trixbridge Gas, Coke, and Railway Company was,' he said, 'a magnificent example of the benefits resulting from the great principle of association, and the whole scheme justified the character of England as the greatest commercial country in the world.' His admiration went further than mere words. He helped us famously with our bill in the committee, and made a fine speech about us in the House upon the 'second reading,' of which I was sorry to find, next day, that the stupid chatter going on in the House all the time prevented the reporters from hearing a single word.

In spite of this, however, we got our bill; and this glorious triumph was the occasion of my passing a 'night in the House' such as I shall never forget.

It was on the evening when the 'bill'—of course I mean the Grand Trixbridge Gas, Coke, and Railway Company's Bill—finally passed the House of Commons. Our excellent member had got me a seat in the Speaker's Gallery; he came and sat beside me there, and pointed out the celebrities of the House. I saw the premier, Lord John, Mr Диззи, and other people, ministerial and oppositional, whose names I already knew. Besides these, I was lucky enough to see Lord Octavius Fitzhugh, our county representative, and his colleague, Mr Wire Cartridge, whose presence on this occasion was the more important, seeing that they so rarely attend the House. For half an hour and more I sat still, trying to hear what was said amidst the gabble going on upon all sides, and the noise made by members coming, going, and circulating like ants in a hillock, though not quite so silently, and possibly without doing so much work. Presently a member, whose face I knew—it was our other representative—stood up near the Speaker, flourishing a paper in his hand.

'That's our bill,' said Mr Aspinall—'to be "read a third time."'

I listened with all my ears, but could not even catch the title; all I heard were the words 'do pass.' But my companion, who knew the ways of the place, rose with a satisfied air and said:

'So that's all right, and now we can go to dinner.'

To celebrate our anticipated success, Messrs Pouncey and Co., our parliamentary agents, had invited the whole batch of us—members, directors, witnesses, solicitors; every one, in short, connected with the bill and the company—to a grand spread. Whether the cost figured in their account, I never heard, but believe not, at all events in that identical shape. But this was no concern of mine. The viands were excellent, and so was the wines. We did ample justice to both. The dinner came off in one of the handsome members' refreshment-rooms in the new palace of legislation. All the appointments, even to the plates and dishes, had 'House of Commons,' written in the black-letter which Mr Barry is so fond of, stamped upon them. The massive silver forks and spoons were thus marked, and bore, besides, the gridiron—or portcullis, as Mr Aspinall called it—the arms of the city of Westminster. This made them, he told us, national property; and any thief who carried off a single spoon would be guilty of high treason, and punished like Colonel Blood, who stole the king's crown some hundred years ago.

We had a jolly dinner, but broke up early, as everybody but myself seemed to have business to do. The House, we learned, had got into a debate, which promised to be long. As we left the dining-room, Mr Aspinall politely proposed to shew me some of the curiosities of the edifice, which I was most anxious to see. Barry's palace is nearly as big as a town; and one might go to the lobby, or the committee-room, or anywhere else that business called one for a year together, without guessing at a tenth part of the vast size and contents of the pile. So we went on, and up, and round, and down again, through a series of halls, ante-chambers, galleries, and winding staircases that seemed endless and countless. I saw a great deal of painting, and a great deal more carving, and heard a number of curious stories about both from my guide, who was exceedingly affable, and seemed to know everything. Yet I cannot say I remember much of what passed. The truth is, that between the corkscrew staircases and the blazing gas, and seeing so many things at once, my head grew quite dizzy, until I scarcely knew where I was. It was quite a relief to me when, as we were passing down another long corridor, a sharp rattle of bells broke upon us, apparently from all sides at once, and kept ringing away in volleys with extraordinary perseverance.

'By Jove,' said Mr Aspinall, 'there's the division-bell! I must rush off, or they will have locked the doors. Wait here for me a few minutes, and I'll come and fetch you when it is over. A thousand pardons.'

With this brief apology, he made a dash at a small door, leading, I suppose, by some short-cut, into the House, and disappeared. I sat down on a bench in a windowed recess, and felt glad of the opportunity to rest a little and clear the cobwebs from my brain. How long I sat there, I don't know; it seemed only a few minutes, but I fancy I fell asleep. When consciousness returned, it was still some time before I could recollect precisely where I was, or how I came there. The gallery seemed to stretch an almost infinite distance right and left. The lights were burning dim, and a pale gleam was thrown across at intervals from the sky outside, for the night was clear and moonlight. I felt shivering and a little frightened. Perhaps, I thought, I had no business there. My guide was gone, and if caught trespassing, what account could I give of myself? Yet I did not know which way to turn for an outlet.

Just then, I saw some dark figures in the distance coming down the gallery. They carried lanterns, and one of them had what looked like a huge black snake coiled up under his arm. As I learned afterwards, they were firemen carrying leathern hose, which were placed every night close at hand to the water-plugs distributed

over every part of the building. It was the precaution regularly adopted to prevent the recurrence of such a catastrophe as that which befell in 1834.

As the men passed, I shrunk up in my recess, and thought it lucky they went by without seeing me. After they were out of sight, I made a desperate effort to escape from my questionable position, and tried at the door through which, as I believed, my friend the member had previously passed. The door opened to my hand, but was the wrong one. I went through nevertheless, and found myself in a lofty and handsome room, quite filled with the moonlight that streamed through an expansive casement opposite the entrance. I walked to the window, and saw that it overlooked the Thames. The moon was high and bright. I could distinguish the bridge on the left, where the repairs were still going on, and the gray towers of Lambeth Palace on the other side of the river. All at once it flashed across me that I had been in the room before. It was a committee-room—the very one where we fought our bill so often, or else a facsimile. Now I knew where I was.

Before I had time to act on this knowledge, however, a step approached the door. I heard the handle tried, but no one entered. Then came the sharp click of a lock. Some vigilant watchman had found the door unfastened, and turned the key without looking in. I was too frightened to call out at the moment; but in a minute afterwards went and tried the door myself. It was too true—I was locked in. What made the case worse, it was Friday night. To-morrow was the legislative holiday. Not a soul was likely to come near the place until committee-time on Monday. Here, then, I thought, am I shut up, starving for forty hours, and, when released, may be arrested for a burglar.

The prospect was not reassuring. I went to the window again, but there was no escape that way. The casement was high up, and fastened besides. Far below, I saw the brown belt of mud left by the tide, which was at ebb, and a tier of barges lying aground in it. But no human being was visible, nor, if I shouted for help, could I have made myself heard at that distance. I did not like the look of things at all.

Coming back into the room, I sat down in the chairman's well-padded seat before the committee-table, and fell into a brown study. The thought then passed across me, that perhaps there were other doors to the place, some one of which might be unfastened. I got up and groped round the wall, particularly in the shady corner where the moonlight could not reach. Before long, I found what I sought. A door there was—a handle—it turned in my grasp—the means of exit were clear. The door, I concluded, led to one of those privileged entrances marked 'Private: for members only.' However, I was too glad to escape to stand on punctilios. I passed out into a sort of ante-chamber leading into a lobby, and thence into a short corridor almost dark, but I managed to find my way to the end which opened upon a well-staircase. Far down a single gaslight was burning, which threw its rays up the shaft. The place grim and lonesome enough; but I was fairly in for it, so down I went.

Down, and still downwards, the well-staircase led me. I reached and passed the gaslight; the place grew gloomier as I sunk further below its influence; yet I went on hoping to get at last into the central hall, or at anyrate to find myself somewhere whence I could emerge from the trap. At last I reached a ponderous iron-bound door, which I pushed boldly open, and went through. Now, thinks I, we must have reached *terra firma*.

A few steps more shewed my mistake. I stood on the brink of another flight of stairs, leading down to some vast and black abyss. Some straggling rays of light, coming I knew not whence nor how, served partially

to reveal the extent and profundity of the cavern, into which I peered with a shudder. From its depths a chill, damp vapour floated heavily up. I scarcely ventured more than a glance into the yawning chasm before me, but drew back hastily to regain the upper air.

At this moment the door above me closed with a thundering clang! The sound reverberated in a long subterranean roll through the vault, and seemed to lose itself at last in infinite space. At that moment, however, escape was uppermost in my thoughts, and I felt my way to the door, and was horrified to discover that it had shut close, and remained fastened by its own massive weight. There was no handle or key in the inside: its smooth surface presented nothing for the grasp.

After a while, I left off trying to open it, and ceased shouting for help. By that time, I had got more accustomed to the gloom, and looking below, saw that there was light enough there to make a sort of darkness visible. Escape by the way I had entered was clearly impossible; so I descended the few steps still left, which landed me at the bottom. I found myself apparently in the very centre of a vast and interminable cavern. The staircase, down which I had come, was built within a massive dwarf pillar that rose from the floor to the ceiling. In front, a long row of similar pillars stretched in endless succession; to right and left other avenues, also flanked by columns of dark stone, extended as far as the eye could reach. Behind me, as I passed round the shaft through which I had descended, the series was still prolonged with no visible termination. Starting out, here and there, from the pillars, were tongues of gas flame, which flickered in the night-wind, and threw a ghastly sepulchral light over the vault. These lights seemed to burn without human interposition. They had evidently burnt through night and day, through session and recess, ever since the edifice was erected. Their presence seemed rather to increase than diminish the intense feeling of solitude, of supernatural gloom and vastness, which weighed upon me as I gazed around.

Then it flashed upon my mind that I must have got to the basement story of the palace of legislation, of which I had heard so many legends. The subterranean area, I knew, contained the vaults beneath St Stephen's Chapel, which were the scene of Guy Fawkes's conspiracy; but they now comprised much more. There were tales concerning the place in modern days—how that men had lost their way in its interminable recesses, and left nothing but skeletons, discovered months after their disappearance, and recognised only by the marks inside their boots. The very notion threw me into a cold perspiration, and I sunk back on the steps, down which I had just come, to recover breath and presence of mind.

Sitting there was not the way to escape, as I presently bethought myself. I started up, determined upon prosecuting an eager and methodical voyage of discovery. Surely there must be some means of exit from the huge dungeon which might be found by searching. I blessed the authorities who maintained the gaslights, dim though they were, in every part of the cavern: if it had been completely dark, I were lost indeed.

I walked down the stone avenues and round the huge columns; they seemed innumerable and interminable. The roof was arched between the pillars, and on every side were carvings of Gothic design, but roughly and imperfectly executed. It seemed like an embryo creation of the sculptures which had arrived at such redundant maturity above. The ceiling was low, and the huge columns with their vast diameters looked particularly massive from the want of height. I had heard often of the 'pillars of the constitution,' but never saw them before. But the lowering roof, stretching away on every side into such vast expanse,

oppressed me with its weight; it seemed constantly about to fall on my head. I stood still more than once, with an awful sensation, as if the constitution were on the point of tumbling in.

While these ideas passed through my bewildered brain, I was traversing through and round a monstrous succession of pillars. In several of them were doors, some of which proved to be fast; others opened upon winding flights of steps, like that I had descended into this world underground. Up, then, I went, with a dogged sort of persistence, turn after turn, groping in the dark and twisting round and round, to find myself invariably stopped at length by another door which I could not pass. I went up so many stairs, and they were all so like one another, that at last I grew quite puzzled. I remembered hearing that there were ninety-six staircases in the palace of Westminster; but it seemed to me at the time that I must have tried at least a hundred and fifty.

The next I attempted gave me a glimpse of hope, lost through my own folly. I got up without obstacle much higher than before, cheered by a light half-way. There was a door as usual, but luckily open. I passed on and up again, and reached a narrow corridor leading evidently to some inhabited district of the place. Before me, as I turned a corner, there suddenly flashed the apparition of a huge fire burning brightly in a wide grate. This formed the background of the picture. Nearer were shelves displaying a goodly array of crockery, and dressers glistening with plate. I was in the kitchen of the House. Before I had time to think, an approaching footstep struck on my ear. At that moment I felt so like a thief, that I fancied I should be taken for one. Recollections of the stories told us at dinner about Colonel Blood and the crown jewels came into my mind with a sort of thrill. In a panic, I turned and fled down the steps, like one escaping from a guilty conscience, and it was not until I had gone some distance among the turnings and windings of the pillars, that I recovered from my fright; then, indeed, I repented my absurd alarm, and sought to regain my way to the kitchen, but found I had lost the clue. I went round and round a hundred columns, and groped up many stairs, but could not discover the one I was looking for. Wearied at last with these perpetual clamberings, I threw myself upon a stone bench, and, as I fancy, slept.

I woke up shivering, hungry, desperate, and frightened. My nervous system was shaken by my sufferings in gloom and solitude. I longed, and yet dreaded, to hear a voice or meet with a fellow-being. In this state of trepidation I wandered on again; presently I came upon a singular scene, which did not tend to reassure me. The floor of the vault opened into a huge circular chasm, whence arose, in grim and fantastic outline, the shapes of wheels, and bars, and cylinders, glimmering in the dim light with most spectral aspect. Looking aloft, I saw the roof also pierced with a circular opening, in which was a vast apparatus of vanes, like a colossal smoke-jack, or wind-mill turned horizontally. On one side was another congeries of mechanism, which I recognised as a steam-engine. But everything was still, and dusty, and rusty. It looked as if unused for years, and passing rapidly into the ghostly state of existence. The concern was, as I afterwards learned, the old 'ventilator' of the House of Commons, long since abolished as a nuisance.

From this point I again roamed on, without guide or purpose, I cannot say how far or how long; my brain had got into a dreamy condition, and the only impression remaining was one of terror and loneliness. It seemed as if I had been buried in this cavern for twenty years. What next restored me to full consciousness was the breath of fresh air, bringing with it a dull murmur of winds and waters; I looked up, and saw a patch of sky bright with moonlight.

I had reached the river-end of the subterranean vault. Above me was a barred grating, opening upon the outer world; some loose heaps of broken stone and brick lay piled against the wall. I climbed up, and grasping the bars, placed my face close against them, inhaling with inexpressible delight the warm and balmy air from the river. The scene was the same which I had gazed upon some hours before from the committee-room; but I viewed it now from below. The moon by this time had fallen and the water risen; the Thames was now brimful between its banks; heavy barges were floating and 'wabbling' about at their moorings. The moonbeams brought out into strong relief the Lambeth Palace towers and riverside buildings on the other side, and drew a pathway of light across the dancing waters, almost up to my grating. For some minutes I clung desperately to the bars, and gazed out like one just emerging from the tomb.

Again I was disturbed and frightened by steps and voices. Two men approached with measured tread; I knew they were policemen, and my terror returned. I fell away from the grating, and in reaching the ground, knocked over a rumbling pile of stones from the heap. The policemen were startled as well as myself at the noise, and came up to the grating hoarsely shouting their customary challenge to trespassers. I slunk up close to the wall below the range of the bull's-eye lantern. As they passed the light along the grating, the shadows of its bars were thrown into colossal relief upon the pillar opposite, and trooped past like a file of black giants in solemn procession.

'There's nothing there, Simmons,' said one of the men at last: 'it must have been the ghost of Guy Fawkes. He haunts the old cellar still, they say.'

'More likely,' replied his companion, 'it was some rats out of the sewer. I'll speak to the clerk of the works to have the holes trapped again.'

'Why, there's plenty of rats up above in the House, let alone those in the sewer,' rejoined the first speaker.

The men laughed, and walked away; when they had passed out of hearing, I got up to renew my efforts at extrication. The brief glimpse I had obtained of the free world had inspired an irrepressible longing for air and liberty.

At length I was cheered by prospects of success. I came to a region of the cavern where several arches were built up with wooden partitions, forming what looked like store-rooms or offices. Here and there were windows, through which I could see big piles of paper. I found a door or two, but they were locked. Around were sundry packing-cases, a dismantled printing-press, and other signs of human frequentation. At anyrate, I was in the neighbourhood of my fellow-creatures.

After a little more wandering, I came to another doorway and flight of steps. I had been up a hundred before without avail; but this time the symptoms were more encouraging: the stairs were wood instead of stone, and lighted from above. I ascended, with a desperate resolve to escape; the time was past for fearing detection: let the worst happen, people are not sent to the Tower in these days.

It was all right. I reached the top without obstruction. Then came a long vaulted corridor, and at the end a double swing-door with glass panels, protected by a fretted grille of brass-work. Through this door, as I opened it, there came a gush of hot air, which, loaded with gas and breath as it was, seemed to me the most delightful breeze I had ever inhaled.

On passing through, I found myself in a vast and lofty hall, so brilliant with lights, that for the moment I was dazzled. I saw only a single figure, quaintly dressed, and with a sword by his side, who shouted in sonorous tones as I entered: 'Who goes home!'

The words thrilled through me. For hours I had

been doubting whether I should ever see my home again! By an irresistible impulse I rushed forward and caught him by the arm: 'I will,' I said; 'for God's sake, take me home!'

The man looked scared, as well he might. But at this moment there came forward a procession, headed by a solemn-looking personage in flowing robes and full-bottomed wig, marching on with all the attributes of grave authority and respect. I recognised the dignified functionary whom I had seen early in the evening occupying the chair of the House. Behind him came an irregular throng of members. It was Mr. Speaker. The House was just up, and the invitation to which I had responded so unexpectedly, was only that unabolished formula, derived from times when a guard of representatives was sometimes necessary to convoy the Speaker safely to his home.

My appearance caused a momentary pause. It was no doubt sufficiently singular. Covered with dust and cobwebs, my dress soiled, my hat battered, my hair dishevelled, with the haggard hang-dog look derived from my long anxiety and subterranean wanderings, I must have looked anything but the respectable character I have always tried to maintain. Mr. Speaker laughed distinctly; the man with the sword caught me by the collar, and looked for a policeman.

At this crisis, a well-known and welcome voice cried: 'Why, 'tis Burtonshaw, by all that's wonderful! Where, on earth, did you come from, my good fellow? and what have you been doing with yourself?'

It was Aspinall, my member for Trixbridge. He released me from a very awkward scrape; and a few words from me explained all necessary particulars.

'And so you have been roaming in darkness and cold for these six hours in the regions below,' he said at last; 'but come along, 'tis hardly two o'clock yet. A brush and cold water will put you to rights; and, egad, we'll make a night of it yet!'

I know that we did not get home till morning, and that the next few hours were spent far more pleasantly than the last half-dozen had been. But nothing occurred either then or since to efface the recollection of the sufferings and sensations I had experienced during My Night in the House.

GLIMPSES OF AFFAIRS IN AMERICA.

THE KANSAS-NEBRASKA AFFAIR.

It will be recollected that on the occasion of constituting the state of Missouri, in 1820, there was a compromise among parties to the effect that, in all the territory which had been ceded by France north of 36° 30', the state of Missouri excepted, slavery should be for ever prohibited; and the act which admitted the state to the Union bore a clause of this kind. Here was a law settling the question so far, one would think. Events proved that this was not so certain. Missouri having edged itself in as a slave state, there the affair rested; and when, in 1836, a slice of fresh free territory was added to this slave state, the compromise-clause does not appear to have been agitated. It was reserved for Mr. Pierce's first congress to be troubled with the resurrection of a measure which the bulk of the members—and Pierce to boot—had probably begun to hope was past being brought to life. On the 15th of December 1853, a bill was submitted to the senate to organise the territory of Nebraska; and on this occasion the unhappy compromise rises from the dead. Let us look at our maps, and see where lies the region which was to provoke one of the severest contests that has ever occurred in or out of congress.

Nebraska was the name at first given to a large

tract of country, having on the east Missouri, Iowa, and Minnesota, and stretching from 36° 30' or thereabouts, to 49° on the border of Canada. Its limits on the west were New Mexico, Utah, Oregon, and Washington. The more eastern portion of this vast territory, was fertilised by the rivers Platte, Kaw or Kansas, and other tributaries of the Missouri, and its only occupants were certain tribes of Indians. The rich lands on the borders of the rivers, and beyond them the rolling and flowery prairies, were, however, becoming so attractive to be much longer exempted from the over-operating law of Anglo-American migration. The federal government had begun to cause regular explorations west of Missouri, about 1838, but on so imperfect a scale, that fresh and much more extensive investigations were ordered in 1842; the commander of the scientific explorers on this occasion being Lieutenant John Charles Fremont. The history of this journey of discovery to the shores of the Pacific is full of romantic incident, and as affording accurate accounts of that great western wilderness which will shortly afford a home for millions of civilised men, is deserving of more notice than it has generally obtained in Europe. Fremont, 'the pathfinder,' was eminently successful in his explorations through the obscure passes of the Rocky Mountains. On one of the topmost peaks of this lofty range, upwards of 13,000 feet above sea-level, he gallantly waved in triumph the national flag, where, as he says, 'never flag waved before.'

The discoveries of Fremont opened the way for settlements, but none, except in an irregular manner, could take place till the territory was organised and surveyed; and these final measures were pushed on by Missourians and others personally acquainted with the capabilities of the unappropriated lands. Among the parties who urged forward the bill for organising the territory, there could hardly fail to be a consciousness that, as Nebraska lay directly north of 36° 30', it was exempted from the contamination of slavery, in virtue of the compromise. But, then, was this compromise of abiding effect—was it a compromise at all? All admitted, what was undeniable, that there was a statute which guaranteed that all lands north of the line 36° 30', should be consecrated to freedom. This awkward difficulty was got rid of by declaring that the statute was unconstitutional, an interference with the rights of squatter sovereignty. As for there having been a compromise, where was it seen in any valid obligation? It was only a fond tradition, of no binding effect whatsoever. There may have been some mutual concessions among parties when the Missouri bill was passed, more than thirty years ago; but what had the present generation to do with the parliamentary stratagems of a past age? Besides, the compromise measures of 1850 affirm and rest upon the proposition, 'that all questions pertaining to slavery in the territories, and the new states to be formed therefrom, are to be left to the decision of the people residing therein, by their appropriate representatives, to be chosen by them for that purpose.*' According to this view of the subject, the Missouri compromise of 1820 was over-ridden by Clay's omnibus measure of 1850, which was said to obliterate the line 36° 30' from the map. Neither branch of congress unanimously adopted so sweeping a doctrine. The progress of the bill, which speedily assumed a form for organising two territories, Kansas and Nebraska, was opposed at every step.

Again, expostulation was useless. The bill passed both branches of the legislature in May 1854, the majority, as customary on similar questions, being swayed by northern Whigs. An act was accordingly framed for organising Kansas and Nebraska as separate

territories, with the whole apparatus of local government and legislation; and giving to the inhabitants the right to introduce or reject slavery, on the true squatter-sovereignty principle. The two territories being now fairly established, that kind of rush of settlers ensues which has been previously pictured. In their choice, Nebraska appears to have been passed over in favour of Kansas, which, lying to the south, on the parallel 36° 30', immediately adjoining Missouri, drew crowds towards it; and, as is well known, became the object of a keen and disorderly competition between the southern slaveholding party and the free-soilers of the north. There was little time to spare. In the old world, kingdoms and principalities have taken centuries to mature. The greater number, after a thousand years of social organisation, have not yet acquired so much as the capacity to keep order at a public meeting, let alone the power of self-government. Even the British monarchy, with all its appliances, seems to be unable to ripen its ordinary run of colonies under a period of some years—indeed, several of the more elderly of these communities are now, after long tutelage, only beginning to walk alone. The United States contrive to arrive at this maturity in a few weeks or months. Kansas was organised on the 30th of May 1854, and on the 29th November following, it was to elect a delegate to represent it in congress. In the short intermediate period, cities, towns, and voting-places were to be established; though, as the materials of architecture were principally deals and canvas, this feat was perhaps no great stretch of genius.

Previously to its organisation, Kansas had become a hopeful field of labour to several missionaries connected with one of the divisions of the Methodist body, which is known to have done good service in carrying a knowledge of religion into remote quarters of the Union. Among those who had set up their tabernacle in Kansas, was a somewhat renowned personage, the Rev. Tom Johnson, who is described as ultra coarse and presuming—a violent pro-slavery partisan, and a ready tool of those planters in Missouri who had an eye to the fertile plains of the territory. This worthy, whose head-quarters were at a place called the Shawnee Mission, a short way from the frontier, held slaves long before the organisation of Kansas—a circumstance which helped materially forward the plan of introducing and holding slaves on a large scale. Of the Rev. Tom's clerical accomplishments, we possess no record. All we know is, that, located in a hulking brick-building at Shawnee Mission, he was a leading man among those who charged themselves with enlightening the Shawnees, Delawares, Kaws, Sacs, Foxes, and other tribes of Indians; some of whom, as our authority states, already possessed in an 'eminent degree the marks of whisky civilisation.*' We do not learn that Tom kept a barrel to aid him in his labours; but that is of no consequence. There were barrels at hand, and they were doing their usual horrid work on the unhappy Indians—a doomed race. The bill opening the territory to white immigration, provided that the natives should not be illegally deprived of their reserves; but no arrangement, however humane, short of the annihilation of whisky, could sustain them in their possessions, and, unless removed, they were evidently destined to become beggars and plagues to society. A number, wisely ceding their lands on reasonable terms, were transferred to localities at a suitable distance, where they remain till a fresh wave of white immigration overtakes them.

As the aborigines, half demoralised, gloomily clear out, the whites pour in; land-offices are opened; 'claims' begin to dot the face of the country; and the

* Report of Senate's Committee on Territories, in Reference to Nebraska, January 1856.

* The Conquest of Kansas by Missouri and her Allies. By W. Phillips. Boston. 1856.

cluster of ugly buildings at Shawnee Mission, becomes a rallying-point for the settlers. We are to view Kansas in this transition state in July 1854, when the contest between pro-slavery and anti-slavery emigrants comes distinctly into notice. According to the account of the pro-slavery Missourians, they were stung by newspaper reports that great bands of New Englanders would soon be on their way to introduce free institutions into Kansas. About this time, several joint-stock concerns were formed in the free states for this avowed purpose. One of them, called the New-England Emigrant Aid Company, with a capital stock of 5,000,000 dollars, was legalised by an act of incorporation from the legislature of Massachusetts. The plan proposed by the company was this: Agents were to buy lands in Kansas, and sell them in lots to immigrants, until the territory was organised as a free state; then, all funds being realised, and a dividend declared, the agents were to select a fresh field of operations in order to organise another free state. In short, it was a grand device to give free institutions to all the new territories, one after the other; and if unopposed, there could have been little doubt of its success. These projects alarmed the Missourians—at least, such is their story. It is, however, quite as clear that the pro-slavery men were, from the first, equally on the alert; and we are to conclude that both parties had some time previously determined to run a race for the territory. The committee of congress which afterwards investigated the matter, states in its report, that 'within a few days after the organic law was passed, and as soon as its passage could be known on the border, leading citizens of Missouri crossed into the territory, held squatter meetings, and then returned to their homes. Among the resolutions are the following: That we will afford protection to no abolitionist as a settler of this territory: that we recognise the institution of slavery as already existing in this territory, and advise slaveholders to introduce their property as early as possible.' Then, early in July, a meeting of an association, having the same object in view, takes place at Westport, and resolves that it will hold itself in readiness to remove any and all emigrants who go into Kansas under the auspices of the Northern Emigrant Aid Societies. Thus, two opposite parties were distinctly pitted against each other. Had the Missourians confined themselves to the peaceful settlement of planters and slaves, no fault could be found with them *under the constitution*, however much, on moral grounds, we might have lamented their aggressions. But the pro-slavery men went a step beyond their constitutional rights. Not contenting themselves with a plan of peaceful emigration, they resolved, as we have seen, to gain their ends by violence. One excuse for their outrages is, that in giving a charter of incorporation to the New-England Emigrant Aid Company, the legislature of Massachusetts committed a trespass on the constitution; because no state is warranted in doing anything which will operate on the institutions of another state. For anything we can tell, this may have been an indiscreet and federally unlawful act; but, if such were the case, there was surely legal redress before the supreme courts of the Union. Nothing, in a word, can justify the Missourians in having armed themselves to oppose the settlement of the northern emigrants; and for this they stand condemned in the estimation of all right-thinking persons in Europe and America.

A number of quietly disposed emigrants had begun to spread themselves on the banks of the Kaw, when they heard that they were to be attacked. They were discomposed, but not frightened, and stood their ground. It seems to be customary to give the inhabitants of many of the states certain nicknames, by which they are generally known. The natives of Illinois are called *Suckers*; those of Indiana, *Hoosiers*;

and the Missourians receive the unpleasant name of *Pukes*. Well, the story ran in Kansas that the Pukes were coming, and soon a squad of them did make their appearance. Phillips, whose work presents the only intelligible narrative of the Kansas troubles that has fallen in our way, gives a graphic account of the Pukes, or 'border ruffians.' They are of several kinds. Those of the unadulterated type, are decided characters. 'Most of them,' he says, 'have been over the plains several times; if they have not been over the plains, the probability is, they have served through the war in Mexico, or seen "a deal of trouble in Texas," or at least run up and down the Missouri river often enough to catch imitative inspiration from the cat-fish aristocracy. I have often wondered where all the hard customers on the Missouri frontier come from. They seem to have congregated here by some law of gravity unexplainable. Perhaps the easy exercise of judicial authority in frontier countries may explain their fancy for them. Amongst these worthies, a man is estimated by the amount of whisky he can drink; and if he is so indiscreet as to admit he "drinks no liquor," he is set down as a dangerous character, and shunned accordingly. Imagine a fellow, tall, slim, but athletic, with yellow complexion, hairy faced, with a dirty flannel shirt, red, or blue, or green, a pair of common-place, but dark-coloured pants, tucked into an uncertain altitude by a leather belt, in which a dirty handled bowie-knife is stuck rather ostentatiously, an eye slightly whisky red, and teeth the colour of a walnut. Such is your border ruffian of the lowest type. His body might be a compound of gutta-percha, Johnny-cake, and badly smoked bacon; his spirit, the refined part, old Bourbon, "double rectified;" but there is every shade of the border ruffian. Your judicial ruffian, for instance, is a gentleman; that is, as much of a gentleman as he can be without transgressing on his more purely legitimate character of border ruffian. As "occasional imbibing" is not a sin, his character at home is irreproachable; and when he goes abroad into the territory, for instance, he does not *commit* any act of outrage, or vote himself, but after "aiding and comforting" those who do, returns, feeling every inch a gentleman. Then there are your less conservative border-ruffian gentlemen. They are not so nice in distinctions, and, so far from objecting, rather like to take a hand themselves; but they dress like gentlemen, and are so after a fashion. Between these and the first-mentioned large class, there is every shade and variety; but it takes the whole of them to make an effective brigade; and then it is not perfect without a barrel of whisky. The two gentlemanly classes of ruffians are so for political effect, or because they fancy it is their interest. The lower class are pro-slavery ruffians, merely because it is the prevalent kind of rascality; the inference is, that they would engage in any other affair in which an equal amount of whisky might be drunk, or as great an aggregate of rascality be perpetrated. Such was the kind of customers who presented themselves to the astonished gaze of the early citizens of Lawrence, while it spread its tent-like butterfly wings, just emerging from its chrysalis state, on the banks of the Kaw.'

The two principal officers appointed by the president to initiate the territorial government, were A. H. Reeder, as governor, and S. D. Lecompte, as chief-justice. Reeder was evidently not the man for the situation. He arrived in October, and the election of a delegate to congress took place, as has been said, on the 29th of November. At this election, Whitfield, the pro-slavery candidate, was returned; but the majority in his favour was swelled by 1729 illegal votes, given by bands of men who crossed the frontier from Missouri—another act totally unjustifiable, and the immediate effect of which was to further excite the people of the northern states, induce acts of

retaliation, and exasperate the actual settlers against their neighbours in Missouri.

Dire events followed, but we must leave an account of them to a future number. W. C.

AT THE HÔTEL DESSIN.

What, will you walk with me about the town,
And then go to mine inn and dine?

Comedy of Errors.

'To the Hôtel Dessin,' said I, putting the book in my pocket.

I deny that I am romantic; I deny, unequivocally, that I am influenced by fictitious sympathies. I never was an idealist in my life; I never mean to be one; and yet I told the coachman to drive me to the Hôtel Dessin.

The fact was, that I had been reading the *Sentimental Journey* all the way from St Omer; and when I reached Calais, and jumped into a *fiacre*, the name rose to my lips almost before I was aware of it. So away we rattled through a tangle of gloomy little streets, and into the court-yard of 'mine inn.'

An aristocratic-looking elderly waiter, with a ring and a massive gold watch-chain, sauntered out from a side-office, surveyed me patronisingly, and said in the blandest tone:

'What is it that monsieur desires?'

'A private room to begin with. At what hour is your table d'hôte?'

'We have no table d'hôte at the Hôtel Dessin,' replied the waiter languidly; 'our visitors are served in their apartments.'

'Then let me have a dinner as speedily as possible, and a good one, remember.'

He looked at me again, as if implying that my tone was not sufficiently deferential—yawned, rang a feeble little bell, and sank, exhausted, upon a bench beside the door. A pretty chamber-maid attended the summons.

'Marie, conduct monsieur to one of the vacant rooms on the corridor by the garden. And, Marie, on thy return, my child, bring me a glass of absinthe and water.'

Leaving this gentleman extended on the bench in an ostentatious state of ennui, I followed the neat little feet and ankles of my conductress up stairs and along a passage full of doors. One of these bore an inscription which at once arrested my attention and my footsteps—**STERNE'S ROOM.**

'Stay, mademoiselle!' I exclaimed; 'can I have this one?'

Marie smiled and shrugged her shoulders. 'Certainly,' she said, unlocking the door. 'The chamber is at monsieur's service. The English adore it. And why? Because somebody or other slept in it many years ago. How droll they are these English! Comment! is monsieur English? Ciel! what a mistake I have committed. Monsieur will never forgive me.'

It needed, however, no great amount of protestation on my part to convince Mademoiselle Marie that I was not in the least affronted; so she drew up the blinds, dusted the table in a pretty ineffectual sort of way with the corner of her little apron, hoped that monsieur would ring if he required anything, and tripped gaily out of the room.

As for me, I threw myself into a chair and surveyed my new quarters. A portrait of Sterne hung over the fireplace. It was painted on panel, oval-shaped, dark with age and varnish, and looked as though it had been taken during his visit to Calais—if one might judge by the cracks and stains of it. The cheek rested on the hand; the eyes were turned full upon me with

that expression of keen penetration which characterises every one of his portraits. I sat for a long time looking at it, till the waiter came and prepared the table.

'And now, garçon,' said I, after a considerable interval, during which I had been very satisfactorily employed—'and now, garçon, do you really mean to tell me that this is Sterne's room?'

'Upon my honour, monsieur,' replied the waiter, laying his hand upon his heart.

'But how can you be certain after three-quarters of a century, or perhaps more, have gone by?'

'The event, monsieur,' said the waiter, 'has been preserved in the archives of the house. We pledge ourselves to the veracity of the statement.'

I surveyed the man with admiration. He was the grandest waiter I had ever seen in my life, and I had had some little experience, too.

'What wine does monsieur desire for his dessert?'

I hesitated. Under ordinary circumstances, I should have said port or champagne; but his sublimity abashed me. I ordered a bottle of Johannisberger.

To my right lay a delicious garden, radiant with beds of verbeas and scarlet geranium, and flooded with the evening sunlight. The great trees nodded and whispered, and the windows at the opposite side of the quadrangle shone like burnished gold. I threw open the *jalousies*, wheeled my table up, plucked one of the white roses that clustered outside, and fancied I could smell the sea-air.

'And so,' said I, complacently peeling my peaches, 'this is actually Sterne's room! He once sat beside this casement where I am now seated; looked out into this garden, where— But who knows? Perhaps the opening scenes of the *Sentimental Journey* were even written in this chamber, and here am I with the book in my pocket. Now, this is really delightful! Yorick'—and I poured out a glass of the amber Johannisberger, and addressed myself to the portrait over the fireplace—'Yorick, your health!'

I took the volume out, and turning the leaves idly, came to the chapters that treat of the *désobligeante*. I was decidedly in a soliloquising mood.

'Now, if I were beginning, instead of ending my journey,' said I, 'there's nothing I should have preferred to the *désobligeante*. No doubt, there is one to be had somewhere. What if the identical vehicle be still in the stables! That's nonsense, of course; and yet, I should just like to make the inquiry. Yorick, your health again, and let me tell you, sir, that it's not every man who, fifty years after his decease, gets toasted in wine at seventeen francs the bottle!'

There was a tap at my door.

'A thousand pardons,' observed the waiter, looking in. 'Monsieur is alone?'

'Go to the mischief!' said I savagely. Fortunately it was in English, so he did not understand me.

'There are two gentlemen here, monsieur—two milords, your countrymen, who desire particularly to be permitted to see this apartment for a moment.'

'"An Englishman does not travel to see Englishmen,"' I muttered to myself, quoting page nineteen of the *Sentimental Journey*.

'Am I honoured with monsieur's permission to shew them up?'

I was forced to say yes—not very graciously, I fear; and he ushered them in accordingly.

The first was a spare, eager-looking man, with keen quivering nostrils, and a brow furrowed with thought and expressive of immense determination of character. The appearance of the second was still more remarkable. I could not remove my eyes from his face, and yet I could scarcely have told you what it was that so attracted me. His forehead was broad and high; his mouth open and eloquent; his hair black, glossy, and falling in smooth pendulous masses almost to his

shoulders. His eyebrows were prominent and bushy, and the eyes beneath them animated by a living radiance, alternately dreamy and tender, wild and energetic. I have since heard them compared to 'the rolling of a sea with darkened lustre,' and I can think of no words which better express their changefulness and their depth.

He entered last, but stepped before his friend, and stood looking up at the portrait. The other bowed and apologised to me in a few brief hesitating words for their intrusion.

Presently the second comer turned round, and without any previous recognition of my presence, said:

'I see that you two have been dining together. Has the worthy prebend been an agreeable companion?'

The oddity of the address pleased me.

'I cannot say that I have wanted for amusement,' I replied smiling, 'since the *Sentimental Journey* has been lying beside my plate all the time. Will you be seated?'

He needed no second invitation, but dropped indolently into an easy-chair, and lay back with his eyes still fixed on the picture; while his companion walked over to the window, and stood there, looking out, with a fidgety uneasy countenance, as if he had seen quite enough of the room, and was more anxious to go than stay.

'I do not admire the *Sentimental Journey*,' said he in the easy-chair. 'It is poor sickly stuff; and the oftener you read Sterne, the more clearly will you perceive its inferiority to *Tristram Shandy*. There is truth and reality in the one, and little beyond a clever affectation in the other. But Sterne's morals were bad. His heart was bad; his life was bad. He dallied with vice, and called it sentiment, or combined it with wit, drollery, and fancy, and served it up for the amusement of the fashionable world, whose idol he was. His mind oscillated ever on the confines of evil, and from this dangerous element he drew his "effects," his clap-trap, and his false whimpering sensibility. There is not a page of Sterne's writings undefiled by some hint of impurity; and yet he approaches the subject with a mixture of courage and cowardice, as a man snuffs a candle with his fingers for the first time; or, better still, like that trembling darning with which a child touches a hot tea-urn—only because it has been forbidden. He is a hypocrite, because he affects to be the ally of virtue, and entertains all the while a secret sympathy with the enemy. At the same time, I don't think his hypocrisy can do much harm, or his morals either, unless to those who are already vicious.'

The gentleman at the window faced round, and shook his head.

'You are seldom just to authors for whom you have no liking,' he said in harsh quick tones; 'and it seems to me that in this instance you jump too hastily at conclusions. It does not follow that a man is a hypocrite because his actions give the lie to his words. If he at one time seems to be a saint, and at another a sinner, he possibly is both in reality, as well as in appearance. A person may be fond of vice and of virtue too, and practise one or the other according to the temptation of the moment: a priest may be pious, and at the same time a sot or a bigot; a woman may be modest, and a rake at heart; a poet may admire the beauties of nature, and be envious of those of other writers; a moralist may act contrary to his own precepts, and yet be sincere in recommending them to others. These are indeed contradictions, but they arise out of the contradictory qualities of our nature. A man is a hypocrite only when he affects to take delight in what he does not feel, and not because he takes a perverse delight in opposite things.'

'An admirable piece of metaphysical defence,' said the other, whom, for the sake of distinction, I shall call the philosopher; 'but one that, after all, does not

go far to prove your case. Remember Sterne's neglect of his loving wife, and the heartlessness of his flirtations, and then judge how sincere may have been those tears which he snivelled so plenteously over a dead donkey at Nampont. Pahaw! 'tis the very mockery of virtue!'

'And a compliment to it at the same time,' retorted the metaphysician. 'Come, you are severe to-day, and misjudge him from an excess of manner here and there. The profoundest wisdom is sometimes combined in his pages with an outward appearance of levity; and many passages which have to bear the charge of coarseness, contain, nevertheless, a sterling view of love and charity. Think of Uncle Toby!'

'Who pitied even the devil!' said the philosopher, extending his hand indolently for the bottle of Johannisberger which I had just pushed towards him.

'Who is one of the finest tributes ever paid to human nature!' exclaimed his friend. 'Why, this I will say, that Shakspeare himself never conceived a character so genial, so delicious, so unoffending! Then, again, turn to the story of Le Fevre: it is perhaps the finest in the English language. I cannot conceive how Goldsmith could call Sterne "a dull fellow." The author of the *Vicar* should have known better.'

'Perhaps,' said I, venturing for the first time to mingle with their conversation, 'the tone of Goldsmith's mind was too thoroughly English to appreciate the glancing transitions, the poignant though artificial wit, and the extraordinary variability of Sterne. It has always appeared to me that, although his style was so racy, so rapid, so idiomatically English, his genius and disposition inclined more towards the characteristics of the French writers.'

'You mean Rabelais,' said the philosopher; 'and Rabelais he was, only born in a happier age, and gifted with sentiment.'

'I was not alluding particularly to Rabelais,' I rejoined. 'I believe I was thinking more of the modern French school—of the Balzacs, Karrs, and Paul de Kocks, who can scarcely be supposed to have imitated a half-forgotten English writer of the last century.' Both of my visitors looked interested, and I went on: 'It is in his abrupt variations of feeling that this resemblance forces itself upon me. I find in the writers I have named, and in fifty others who are their pupils and contemporaries, the same antithetical propensity which delights in giving a comic turn to a serious passage—the same implied satire and half-expressed double-entendres—the same unfinished sentences, and the same hysterical mingling of smiles and tears. Compare, for instance, *Tristram Shandy* and *L'Amoureux Franci*. A Hindoo would swear that the soul of Laurence Sterne had taken up its present abode in the body of Paul de Kock. Again, let us consider his power of turning trifles to account, and evolving from the least promising incidents the most exquisite combinations of feeling and fancy. Apropos of a pin, he fills a page with wisdom on humanities; and from his barber's recommendation of a wig-buckle, deduces an admirable analysis of the French national character. Is not this one of the leading traits of modern French authorship? Place in the way of one of these witty and imaginative *feuilletonists* the most barren and uninteresting of objects, and he will enrich it with all the embroideries of art, clothe it in the rainbow hues of his own fancy, and, though it were but an old pair of ruffles or a market-barrow, end by making you laugh or cry according to his pleasure. In this manner, an ingenious French writer has elaborated a charming volume on no more extensive a subject than a journey round his room; and from so simple an incident as a flower springing up accidentally within the confines of a prison, another has contributed to our modern European literature the most touching, the most humanising, the most philosophical of moral stories.'

Thus, in his gaiety and his gravity alike, in his treatment of minutæ and his natural temperament, I find myself irresistibly reminded of the French style whenever I open a volume of Sterne. Do you follow me?"

"Perfectly," replied the philosopher; "and I admit the justice of your remarks. He has all the volatility, as well as all the seriousness of the French character—that seriousness which he was the first as well as the last traveller to discern. "If the French have a fault, Monsieur le Comte," he says in the chapters on the passport, "it is that they are too serious."

The metaphysician smiled. "Not the last traveller," he said; "for in those notes that I made on my late journey through France and Italy, I particularly observed this exception to their generally fluttering and thoughtless disposition. These last are the qualities that strike us most by contrast to ourselves, and that come most into play in the intercourse of common life; and therefore we are generally disposed to set them down as an altogether frivolous and superficial people. It is a mistake which we shall do well to correct on further acquaintance with them; or, if we persist in it, we must call to our aid an extraordinary degree of our native blindness and obstinacy. Why, the expression of a Frenchman's face is often as melancholy when he is by himself as it is lively in conversation. The instant he ceases to talk, he becomes "quite chop-fallen."

"It is strange," observed the philosopher, "how little this contradiction in their character has been noticed. They have never had the credit of it, though it stares one in the face everywhere. You can't go into one of their theatres without being struck by the silence and decorum that reign throughout the audience, from the scholar in the stalls to the workman in the galleries."

"This results in part, perhaps, from their studious inclinations," said the other. "The French are fond of reading as well as of talking. You may constantly see girls tending an apple-stall in the coldest day in winter, and reading Voltaire or Racine. Such a thing was never known in London as a barrow-woman reading Shakspeare. Yet we talk of our wide-spread civilisation and ample provisions for the education of the poor!"

"To be read thus by the lowliest as well as the loftiest, should be the highest ambition of the poet," exclaimed the philosopher enthusiastically. "Do you not remember, William, during that pedestrian excursion which you, Wordsworth, John Chester, and I once made from Nether Stowey to Linton, we stayed at an old-fashioned inn near the Valley of Rocks, breakfasted deliciously on tea, toast, eggs, and honey, and found a little worn-out copy of the *Seasons* lying in the window-seat? I took it up, and with a feeling that I cannot describe to you, exclaimed aloud: "That is true fame!"

"Yes," replied the metaphysician with a sigh; "I remember it perfectly. I was but a lad at the time, and I listened as if in a dream to every syllable that fell from the lips of either Wordsworth or yourself. Fame, thought I, with a sinking heart—alas! to me it is but a word: I shall never possess it; yet will I never cease to worship and to pursue it. At that time, I thought to be a painter; and while I lost myself in admiration of a fairy Claude, or hung enraptured over a Titian dark with beauty, I despaired of the perfection I worshipped. And I was right: I should never have made a painter."

His friend smiled, and shook his head. "And yet," said he, "you are content, I should think, with the share of renown that has fallen to your lot. Do you still hold that fame is but a word?"

"I hold it to be a glorious reality," replied the metaphysician; "but one which, least of all others, should

be defaced by the petty considerations of our worldly vanities and selfish personalities. Fame is the inheritance not of the dead, but of the living. It is we who look back with lofty pride to the great names of antiquity—who drink of that flood of glory as of a river, and refresh our wings in it for future flight. Fame, to my thinking, means Shakspeare, Homer, Bacon, Raphael. Fame can attach itself only to the past. Reputation is the property of the present."

"A subtle distinction," said the philosopher, emptying the last glass of my Johannisberger; "but one which"—

The door of the chamber opened.

"Your carriage, gentlemen, is ready," said the waiter.

We all rose simultaneously.

"I am sure," said the philosopher, with an air of high-bred courtesy—"I am sure we must have fatigued and interrupted you, sir, in a most unpardonable manner. I am ashamed"—and here he glanced regretfully towards the empty bottle and the comfortable *fauteuil*—"to have intruded so long upon your patience and your hospitality; but if you should ever chance to wander in the neighbourhood of Nether Stowey, Somersetshire, I will endeavour to atone for my present thoughtlessness, by making you acquainted with our green and hilly country, and our wild seashore. Do not suppose that I say this through a forced politeness. I invite few visitors, and those whom I do ask, I welcome heartily. I am but a hermit in a cottage, however, and cannot promise to give you such vintages as this!"

He took a card from his waistcoat pocket, and advancing with an undulating step, laid it down beside me on the table.

"Samuel Taylor Coleridge!" I exclaimed involuntarily, as my eyes fell on the superscription.

The philosopher extended his hand to me.

"You will not forget to come and see me," he said, "if you visit my county; and I trust you will forgive me for introducing myself. It is a bad habit that one acquires abroad—above all, when one meets a fellow-Englishman."

"I consider," said I, "that I am indebted to Yorick for this piece of good-fortune;" and I pointed to the portrait over the mantel-piece.

Coleridge plucked his companion by the sleeve. "Come, Hazlitt," he said, "we have no time to lose."

"How!" I exclaimed—"is it possible that—that your friend is"—

"William Hazlitt," replied the poet, making the metaphysician known to me with a serio-comic gesture—"William Hazlitt, the dreaded critic—the redoubtable reviewer—the terrible essayist!"

I endeavoured to stammer out something appropriate as they took leave of me; but at that time I was little used to society, and I believe I had never seen a real live author in my life before, so I fear I was not very successful.

Coleridge hurried his friend from the room, and went out last. Just as he reached the door he turned back.

"Have you read my translation of *The Visit of the Gods*?"

I replied eagerly in the affirmative.

"Then you will remember the opening lines," he said gaily:

"Never, believe me,
Appear the Immortals,
Never alone!"

The door closed directly, and he was gone. Then I heard his genial laugh upon the stairs, and presently the rattling of the wheels that bore them away. I never visited Nether Stowey, and I never saw either of my guests again. Both have since passed away, and left only their fame and their undying thoughts behind

them; but I shall never forget that brief acquaintance-ship which began and ended one autumnal afternoon in Sterne's Room, at the Hôtel Dessin.

A NEW BRIGADE.

WHAT are we to do with our ticket-of-leave men? To hang them, or reform them? That is the question that might with propriety occupy the attention of some modern Hamlet: whether 'tis nobler in the mind to suffer the slings and arrows of outrageous fortune—in the shape of handkerchiefs and life-preservers—or to take arms against a sea of troubles—namely, burglary, garrotting, and murder, and, by opposing, end them.

One party indignantly asserts, that having been taken prisoners in the act of making war on society, they are entitled to no quarter, and should be strung up without mercy; the other mildly argues, that they should be let out on parole, and the honour that is proverbially known to exist among thieves, taken as a moral guarantee for their better behaviour. The former would treat them as vermin, and crush them with a strong hand once and for ever; the latter would train them up to useful occupations, as the industrious fleas were taught to go in harness and draw carriages.

Neither plan meets with my approbation. I may occasionally, when speaking of these pests of society, exclaim in a mild ejaculatory tone: 'Hang 'em!' but I am not by any means an advocate for their wholesale extermination. Neither do I overflow with the milk of human kindness to such a ridiculous extent as to say: 'Let them go free, and trust to human nature and the tracts they have read while in prison to prevent them falling into their evil courses again.' I believe that the greater part of them can no more keep from thieving than a cat can keep from cream. They have served their apprenticeship to crime, and can get their livelihood in no other way. They recur as naturally to *their* profession on getting out of prison, as a doctor would to *his*, supposing that the practice of physic were made an indictable offence, which in some instances it certainly should be. No, no; hanging and reformation are not to be thought of: one is impracticable—the other impossible. Transportation I am equally averse to. I have a plan of my own that settles the question at once. I am the *Cædipus* of the nineteenth century, that has solved this great political enigma. With one stroke, as it were, of my feathered sword do I sever the Gordian-knot of modern civilisation. Thus—Use them!

Collect all the ticket-of-leave men now at large into one body, and, instead of allowing them to exercise their ingenuity on ourselves, let them devote their acknowledged skill and talents to the molestation of our enemies. They are formidable enough in twos and threes, as we know to our cost; but what a tremendous engine of destruction should we possess, if all the licensed ruffians now prowling about England were concentrated into one large force! It would be an infernal machine, scattering devastation among all those that had the ill-luck to be opposed to it. On a campaign, the services of such a body would be invaluable. What short work a gang of London housebreakers would have made of Sebastopol, and what a magnificent burglary it would have been! How silently and effectually a company of garroteers would clear away a chain of advanced outposts! A sentry with a pitch-plaster on his mouth would be as helpless as a turtle on his back, and a charge made by a body of men armed with sponges full of chloroform, would be perfectly irresistible. Only imagine the annoyance that would be caused to an enemy by a select band of experienced thieves. They would literally steal into his camp, and carry off everything they could lay their hands on. It is

evident that an army deprived of their cooking-utensils, must surrender at discretion.

But it is impossible, in my limited space, to enumerate the manifold advantages of such a plan. It is a noble idea. It occurred to me while reading the naval and military intelligence contained in the columns of the *Times*. It appears that a number of ticket-of-leave men have enlisted in the Royal Artillery, and that the monotony of barrack-life at Woolwich is occasionally relieved by the daring exploits of these prison-heroes. It is not likely that the artillery is the only regiment thus honoured. Doubtless, large numbers are distributed throughout the whole army. This, in my opinion, is a mistake that should at once be remedied. Artists skilled in the use of skeleton-keys and jemmies will find a *Minie*-rifle but an awkward implement; and the beauties of the manual and platoon exercise will fail to be appreciated by hands accustomed to the more delicate manipulations required for picking pockets.

Now, to let my plan more fully develop itself. Let these ingenious warriors be taken from a sphere where their talents are not properly estimated—some of the poor fellows have even been flogged at Woolwich—and formed into a separate service. This force, into which all the ticket-of-leave men now following their professional avocations in London and the provinces should be draughted, might be organised like the regular army, and called the Brigade of Black-guards. This, again, could be subdivided into regiments of *Ruffians*, of various classes and denominations. Thus, we might have the Royal Riflers, the Smashers, the Dirty Half-hundred, the Roughs; and so on. As in the regulars, there is a company of grenadiers and light infantry attached to each regiment, so, in the irregulars, every corps might possess its garroteers and light-fingered company. National regiments might easily be formed, such as the Irish Black-guards, or the Connaught Stranglers; others might be called after the places where they were raised, for instance, the Notting Hill Burglars, the Petticoat Lane Pickpockets, &c. In the line, regiments occasionally bear the name of some distinguished soldier: the 33d is the Duke of Wellington's Regiment; the 18th is Prince Albert's Own Light Infantry; in the Black-guard Brigade, Jack Sheppard and other celebrities in the Newgate calendar might be similarly honoured. Instead of Sappers and Miners, a body of Pickers and Stealers could be formed; and any members of the Brigade who have been convicted of receiving stolen goods, might with propriety be converted into Fencibles. A corps of marines would, of course, comprise all those whose offence has been mutiny, piracy, and crimes committed on board ship. The days of highwaymen are unfortunately gone by, or a body of cavalry might have been attached to the force, and called the Mounted Riflemen, or Dick Turpin's Own Light Dragoons. The civil department of the service can be administered by members of the swell mob; while the duties of orderly-room clerks, and the office-work generally, will naturally fall to the share of fraudulent bankers and dishonest officials of every description.

The uniform of the Brigade might consist of the elegant gray-cloth suit and muffin-cap peculiar to the inmates of our hulks and dock-yards; and, as a further mark of distinction, the men might be permitted to wear the *recherche* style of *coiffure* fashionable in the various prisons and houses of correction throughout the kingdom. Instead of such devices as lions, tigers, and white horses of Hanover, common in the regular service, each corps of the brigade might wear, as a regimental badge, a magpie, fox, vulture, or other dishonest and rapacious animal; and such mottoes as '*Astutus non animo, Toujours arriére, Humani nihil alienum, Malo fœdari quam mori*,' would be both classical and appropriate. If colours were permitted, those of the

Petticoat Lane regiment might consist of a pair of handsome silk pocket-handkerchiefs. At parades and inspections, each man, instead of the 'small book' shewn in the line, would be expected to produce his ticket-of-leave. Every branch of the service would of course be armed in the way best suited for the display of its peculiar gifts: thus, the Garotteers would be provided with the customary handkerchief and life-preserver; and the battalion of Burglars with crowbars, files, and the various other implements necessary for their particular vocation. Chloroform would be served out to those who have been in the habit of stupefying their victim before proceeding to business; but the Riflers, and Pickers, and Stealers would be naturally expected to find their own arms. The Brigade might be encamped upon Bagshot Heath, which, from old associations, is eminently fitted for the purpose. Should any gibbets still remain in that renowned locality, so much the better; they will be pleasing mementoes of departed heroes, who, had they lived in these days, would have done honour to the force which I hope shortly to see incorporated.

I have merely given the outline of the magnificent design; the details can be arranged hereafter. Like all great reforms, the plan will doubtless have its opponents; but I feel convinced mine is the only practical solution of the great question of the day. If we are tired of being knocked on the head in our parks, choked in our streets, murdered in our houses, and robbed everywhere, the remedy is in our own hands—all we have to do is to organise the Black-guard Brigade.

[There are some little matters in this *jeu d'esprit* not altogether to the taste of the *Journal*; but we may perhaps take our revenge upon our eccentric friend by treating more gravely at another time the position of the unfortunates he makes the butt of his humour.—Ed.]

NATURAL HISTORY OF MY POND.

IN TWO PARTS.—CONCLUSION.

THE next creature we must notice is a blood-sucker upon rather a larger scale, though he operates for the common good; and although no one is proud of his acquaintance, there are few of us who have not at times profited by his kind offices. This friend is the leech (*Hirudo medicinalis*). He is common in the pond, and is really, prejudice apart, a handsome-looking fellow: his back is olive-green, with long red stripes, and his under-surface is yellow, thickly spotted with black. If he is rather a hungry being, and too fond of crying 'Give, give,' he still works for weal, and not for woe. All honour, therefore, to the leech; he is under my special protection. Not so, however, the less organised beings which are nearly allied to him; they are *uncanny*, and are the cause of more mischief than we perhaps know. The commonest of these Planariæ, for so we must term them—(their specific name is unknown to me)—is a small black species, abundant on the leaves of the water-lily, apparently a vegetable feeder, and always herding together in great numbers. But there is another kind, far more elegant, though not quite so plentiful; much larger; of an ovate instead of a linear form, and with a beautifully crenated margin. It is of a white colour, delicately shaded with gray. This may often be drawn to shore with the water-plants. These are beings to be regarded with suspicion: the metamorphoses they undergo are strange, and as yet imperfectly understood; and if they are innocent, yet their first-cousins, the Distomata, can be proved to be guilty enough, causing the disease in sheep known by the name of the rot: a disease which sometimes attacks man also. There is another being in My Pond whose character is

no whit better—a long thread-like worm (*Gordius aquaticus*), often several inches long, curiously coiled up, yet not thicker than a cotton thread. He is not in his perfect state; he means mischief; and is, depend upon it, only an evil spirit in disguise.

The only remaining articulate animals to be mentioned are the pretty little wheel-animalcules; and to make their acquaintance we must call in the aid of the microscope. The little group are, however, quite worth the trouble. The curious wheels with which their mouths are furnished have gained them their name, *Rotifera*. These wheels are often to be seen in full action; the cilia or fringe of minute lashes on them being at such a time in constant motion. The little being then fixes itself firmly to some small stalk or leaf of an aquatic plant, and by the aid of the current so set up, its food is procured. Below this wheel-apparatus is a powerful armament of teeth, arranged so as to look like a cross. The commonest of these is called *Rotifer vulgaris*; but there are many kinds in the pond. They are, for the most part, just visible to the naked eye, but cannot be seen properly without the microscope. The play of the wheels is most curious, and well worthy of notice. At the will of the animal, however, the wheels can be withdrawn, and the little being can crawl along, first fixing the hinder extremity, then bending its body after the manner of a geometric or looping caterpillar, and fixing the upper, or head—then making this the fulcrum, and proceeding as before. This little being is the last to be mentioned of the articulata, though its curious apparatus of wheels make it not the least interesting.

From the jointed or articulate animals, we pass to the mollusks; and of these, by far the most numerous section in the pond are those which resemble the snail in shape and structure. They have a distinct head, and a large foot on the lower surface of the body, by which they walk along the plants on whose leaves they feed. They are water-snails, and there are several species; there is one with the whorls arranged in a perfectly flat coil, like a 'Catherine's wheel,' and from this it has its name, *planorbis*. Of this genus there are two or three species on the pond, as indeed there are also of the next group, or true water-snails, where the spiral is, as it were, drawn out, so as to form a cone. Of these shells, there is one, more than an inch in length, of a brown colour, and very pointed at the apex (*Lymnæus stagnalis*); it is abundant on the leaves of the pond-weed. There is also a lesser species (*L. pereger*), about a quarter the size, and which is rather found along the banks and amongst the water-grasses which fringe the pool; both, however, are plentiful. If these are examined, it will be seen that they all breathe by a large sac, just as the snail does, serving them for a lung; they breathe, therefore, through the agency of the air. There is, however, another shell in My Pond, of a less conical form, and wider in proportion to its length, with an indistinct spiral band winding round the shell. This species (*Paludina vivipara*) breathes through the means of the oxygen dissolved in the water, as many creatures previously examined by us have also done; the breathing is therefore by branchiæ—that is, a row of comb-like gills, over which the water plays.

Unfortunately, the pond does not contain any of the polype-like mollusks or Bryozoa, as they are termed—that is to my knowledge—and no bivalve shells, so that the stock of this class in my preserve is very small.

Of radiated beings, which gain their name from the star-like form in which their parts are usually arranged—the starfish being the most familiar example—there is only one species in the pond (*Hydra viridis*), the pretty little green fresh-water polype. This is not rare upon the submerged stems of various plants. It is a sea-anemone on a very small scale, with long tentacles, and with a much simpler structure, for it is all stomach.

Eight arms surround the mouth, and these arms are used to seize upon creatures larger even than the polype itself. It is very bold, and does not much seem to care what it attacks; and perhaps it has such power of surviving accidents, that it may brave many dangers with impunity. Cut it in two, you only multiply it; turn it inside out like the finger of a glove, and the animal feels no difference—the skin serves for stomach, and the stomach for skin. It walks nimbly along as the rotifers were previously described to do, and may often be seen with numerous young budding forth from the side, each with its tentacles ready; so that it then presents the spectacle of one animal with many mouths, and all searching for food, all eager for prey. The hydra, though small, is extremely rapacious, and seizes very eagerly all things coming within its grasp: even a brother-hydra is sometimes caught and devoured; but he has the privilege of free entry, and escapes undigested from his apparently perilous abode. The poor water-flea is not so fortunate; he is a frequent prey. There is some power resident in the arms of the hydra by which it can destroy its victim. Once in its fatal grasp, there is no escape; and it has been stated by Trembley, that even a young minnow will sometimes be thus caught and devoured by this walking stomach.

And now, last of all, we come to those earliest forms of life grouped together under the name of animalcules or Protozoa, many of which are almost daily making their way from the animal into the vegetable kingdom. My poor little favourite, the volvox, which rolled about under the microscope in such a regular and marvellous manner, is now degraded into a plant. The pretty Diatomaceæ, with their elegantly sculptured skeletons of flint, are also looked upon as vegetables. The most beautiful of those left to me are those living bells, set like flowers upon long stalks, which twist and writhe about with every passing current. These Vorticellæ, as they are called, are lovely objects under a low power of the microscope, and may be seen with the naked eye, looking like mildew on the stem of one of the water-plants. Sometimes, as we watch them, a bell-shaped head escapes from its stalk, and swims, by means of its cilia, actively about through the water. Perhaps my pretty little sun-shaped animalcule (*Actinophrys sol*) is only one of the stages in the development of this vorticella; but this is yet unproved. There are also to be found that proteus of animalcules whose shape is never fixed, now stretching out one portion of its body as an arm, and now another (*Amoeba proteus*): there are also plentifully the flask-shaped *Euclesia*, and of course hundreds of infusorial animalcules. There is indeed almost sure to be some object of microscopic interest surrounding every decaying fragment of leaf, and in every portion of mud brought from the bottom of the water.

Now we have gone together through the various groups of animal life found in a pond not larger than an ordinary mill-pond; and indeed there are few mill-ponds in the kingdom which would not supply every one of the creatures mentioned, except, perhaps, the water-shrew, which is, however, more frequent than is often thought: nay, more than this, all the invertebrate portion can be kept in one of the bowls used for gold-fish, and will make a very pretty vivarium on a small scale. The plants that should be taken are the *Vallisneria spiralis*, which, though not an English plant, can always be readily procured; the callitriche; or, better still, if it grows in the neighbourhood, the water-violet, *Hottonia palustris*, and a few fronds of the pretty *Lemna trisulca*, the ivy-leaved duck-weed. For the living beings, I would recommend the common stickle-back; two or three of the smaller water-beetles, especially those of the genus *Colymbetes*; some of the larvæ of the dragon-fly; the water-scorpion also, and the *Notonecta* before mentioned; plenty of the crustaceous

animals described here, which will serve not only for amusement, but also for use, as they will supply the larger beings with food; and in addition to these, one or two species of the larger snails, of which the genus *Planorbis* or *Paludina* is to be preferred, and some of the smaller kinds of *Lymnæus*, *L. stagnalis* being rather too voracious for so small an aquarium; then, though last, not least in importance, the *Hydra viridis*; and the experimenter will find more amusement in so small a compass than he could have deemed possible before the trial. One word also of caution: every one making such a collection should avoid the Vorticellæ, for they attach themselves to weakly animals, and cause them to die at all events more quickly than they otherwise would have done. To an inhabitant of London, the additional information may be given, that an afternoon's excursion to Hampstead Heath would supply him with all the species here mentioned.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXII.—CHASED BY A 'GRIZZLY.'

THE bear was one of the largest of his kind; but it was not his size that impressed me with fear, so much as the knowledge of his fierce nature. It was not the first time I had encountered the grizzly bear; and I knew his habits well. I was rather surprised at seeing the *Ursus ferox* in that region. The range of this species is more to the west, among the defiles of the Rocky Mountains; but individuals occasionally wander as far east as the meridian of the Mississippi. The one before me was of a yellowish-red colour, with legs and feet nearly black; but colour is no characteristic among these animals, scarcely two of them being alike in this respect. I was familiar with the form and aspect, and could not be mistaken; I recognised the long shaggy pelage, the straight front, and broad facial disk, which distinguishes this species from the *Ursus Americanus*. The yellow eyes, the huge teeth, but half concealed by the lips, and, above all, the long-curved claws—the most prominent marks of the species, as they are his most formidable means of attack—were all identified.

When my eyes first rested upon this monster, he was just emerging out of the barranca at the very spot where I had climbed up myself. It was his tracks, then, I had observed while scaling the cliff!

On reaching the level of the prairie, he advanced a pace or two, and then halting, he reared up and stood upon his hind-legs; at the same time he uttered a snorting sound, which resembled the 'blowing' of hogs when suddenly startled in the forest. For some moments he remained in his upright attitude, rubbing his head with his fore-paws, and playing them about after the manner of monkeys. In fact, as he stood fronting me, he looked not unlike a gigantic ape.

When I say that I was terrified by the presence of this unwelcome intruder, I speak no more than truth. Had I been on horseback—on the back of Moro—I should have regarded the creature no more than the snail that crawled upon the grass. The grizzly bear is too slow to overtake a horse; but I was on foot, and well knew that the animal could outrun me, however swift I deemed myself.

To suppose that he would not attack me would have been to suppose an improbability. I did not count upon such a thing; I knew too well the disposition of the enemy that approached. I knew that in nine cases out of ten the grizzly bear is the assailant—that no animal in America will willingly risk a contest with him; and I am not certain that the lion of Africa would wear his laurels after an encounter with this fierce quadruped.

Man himself shuns such an encounter, unless

mounted upon the friendly horse; and even then, where the ground is not clear and open, the prudent trapper always gives 'old Ephraim'—the prairie sobriquet of the grizzly—a wide berth, and rides on without molesting him. The white hunter reckons a grizzly bear equal in prowess to two Indians; while the Indian accounts the destruction of one of these animals a great feat in his life's history. Among Indian braves, a necklace of bear's claws is a badge of honour, since these adornments can be worn only by the man who has himself killed the animals from which they are taken.

On the other hand, the grizzly bear fears no adversary; he assails the largest animals on sight. The elk, the moose, the bison, or wild-horse, if caught, is instantly killed. With a blow of his paw, he can lay open the flesh, as if it had been gashed with an axe; and he can drag the body of a full-grown buffalo to any distance. He rushes upon man, whether mounted or on foot; and a dozen hunters have retreated before his furious assault. A dozen bullets—say, nearly twice that number—have been fired into the body of a grizzly bear without killing him; and only a shot through the brain or the heart will prove instantaneously mortal. Gifted with such tenacity of life and sanguinary fierceness of disposition, no wonder the grizzly bear is a dreaded creature. Were he possessed of the fleetness of the lion or tiger, he would be a more terrible assailant than either; and it is not too much to say that his haunts would be unapproachable by man. He is slow, however, compared with the horse; and there is another circumstance scarcely less favourable to those who pass through his district—he is not a tree-climber. Indeed, he does not affect the forest; but there is usually some timber in the neighbourhood of his haunts; and many a life has been saved by his intended victim having taken refuge in a tree.

I was well acquainted with these points in the natural history of this animal, and you may fancy the feelings I experienced at finding myself in the presence of one of the largest and fiercest upon the naked plain, alone, dismounted, almost unarmed! There was not a bush where I could hide myself, not a tree into which I might climb. There was no means of escape, and almost none of defence; the knife was the only weapon I had with me; my rifle I had left upon the other side of the barranca, and to reach it was out of the question. Even could I have got to the path that led down the cliff, it would have been madness to attempt crossing there; although not a tree-climber, the grizzly bear, by means of his great claws, could have scaled the cliff more expeditiously than I. I should have been caught before I could have reached the bottom of the ravine, had I made the attempt.

The bear was directly in the path. It would have been literally running 'into his arms' to have gone that way.

These reflections occupy minutes of your time to read; I thought them in less than moments. A single glance around shewed me the utter helplessness of my situation; I saw there was no alternative but a desperate conflict—a conflict with the knife! Despair, that for a moment had unnerved, now had the effect of bracing me; and, fronting my fierce foe, I stood ready to receive him.

I had heard of hunters having conquered and killed the grizzly bear with no other weapon than a knife, but after a terrible and protracted struggle—after many wounds and sore loss of blood. I had read in the book of a naturalist, that 'a man might end a struggle with a bear in a few instants, if one hand be sufficiently at liberty to grasp the throat of the animal with the thumb and fingers externally, just at the root of the tongue, as a slight degree of compression there will generally suffice to produce a spasm of the glottis, thus will soon suffocate the bear beyond the power of

offering resistance or doing injury.' Beautiful theory! Sagacious naturalist! How would you like to try the experiment? Have you ever heard of birds being caught by the application of 'salt to the tail?' The theory is as correct as yours, and I am certain the practice of it would not be more difficult!

But I digress among these after-thoughts. I had no time to reflect upon 'compressions of the tongue' or 'spasms of the glottis.' My antagonist soon finished his reconnaissance of me, and, dropping upon all fours, he uttered a loud roar, and rushed towards me with open mouth.

I had resolved to await his attack; but as he came nearer, and I beheld his great gaunt form, his gleaming teeth, and his senna-coloured eyes flashing like fire, I changed my design; a new thought came suddenly across my mind; I turned and fled.

The thought that prompted me to adopt this course was, that the bear might be attracted by the carcass of the antelope, and pause over it—perhaps long enough to give me a start, or enable me to escape altogether. If not, my situation could be no worse than it then was.

Alas! my hope was short-lived. On reaching the antelope, the fierce monster made no halt. I glanced back; he was already past it, and closing rapidly upon my heels.

I am a swift runner—one of the swiftest. Many a school-day triumph can I remember; but what was my speed against such a competitor! I was only running myself out of breath. I should be less prepared for the desperate conflict that must soon come off; better to turn, and at once face the foe!

I had half resolved—half turned, in fact—when an object flashed before my eyes that dazzled them. Inadvertently, I had run in the direction of the pond; I was now upon its shore. It was the sun gleaming from the water that dazzled me. The surface was calm as a mirror.

A new idea—a sort of half-hope—rushed instantaneously into my mind. It was the straw to the drowning man. The fierce brute was close behind me; another instant, and we must have grappled. Not yet, not yet, thought I. I should fight him in the water—in the deep water: that might give me an advantage. Perhaps, then, the contest would be more equal; perhaps I might escape by diving!

I sprang into the pond without a moment of hesitation. The water was knee-deep. I plunged onward, making for the centre; the spray rose round me; the pond deepened as I advanced; I was soon up to the waist.

I glanced around with anxious heart; the bear was standing upon the edge. To my surprise and joy, I saw that he had halted, and seemed disinclined to follow me.

I say, to my surprise I saw this, for I knew that water has no terrors for the grizzly bear; I knew that he could swim; I had seen many of his kind crossing deep lakes and rapid rivers. What, then, hindered him from following me?

I could not guess, nor, indeed, did I try to guess, at the moment; I thought of nothing but getting further from the shore, and waded on till I had arrived near the centre of the lake and stood neck-deep in the water. I could go no further without swimming, and therefore came to a stand, with my face turned towards my pursuer.

I watched his every movement. He had risen once more upon his hind-quarters, and stood looking after me, but still apparently without any intention of taking to water.

After regarding me for some time, he fell back upon all-fours, and commenced running round the border of the pond, as if searching for a place to enter.

There were not over two hundred paces between us,

for the pond was only twice that in diameter. He could soon have reached me, had he felt so disposed; but for some reason or other, he seemed disinclined to a 'swim.' For a full half-hour he kept running back and forwards along the shore.

Besides the apprehension in which his presence held me, my situation was far from comfortable. Although there was a warm sun overhead, the water was as cold as ice, and my teeth began to chatter like castanets. I knew not how long the scene was to last. I well knew the vengeful disposition of the grizzly bear, and the untiring pertinacity with which he follows any one who may have roused his resentment. Fortunately, I had neither wounded nor molested him, and I was in hopes that my innocence in this respect might save me from a very protracted siege. I had no other hope of being rescued from my perilous situation.

He appeared to have made up his mind to wait until I should come out; though once or twice I thought he was about to swim towards me; for he halted upon the very edge, craned his head over the water, oscillating the forepart of his body, as if going to plunge in. After manoeuvring in this way for some seconds, he turned his side, and continued to pace along the bank.

What he thought of our relative situations, I cannot tell. A third party, in the position of a spectator, would have regarded the tableau as comic in the extreme. Up to my neck in the middle of the pond, with only my head appearing above the water, I must have presented a ludicrous spectacle; and now that I think of it, I cannot help smiling at the figure I must have cut in the eyes of the bear. I did not laugh at it then; I was too badly frightened for that. There was no laughter in me at that hour.

For a long while—full half-an-hour, I should judge—the bear remained near the edge of the pond. Now and again, he made short excursions out into the prairie; but always returned soon, and regarded me afresh, as though determined not to lose sight of me for any length of time. I was in hopes that he might stray round to the other side of the pond, and give me the chance of making a rush for the ravine; but no; he continued on that side where he had first appeared, as though he suspected my design.

I began to despair. I shivered. The pond must have been a spring, so chill were its waters. I shivered, but kept my place; I dared not move out of it. I even feared to agitate the water around me, lest by so doing I might excite my fierce enemy, and tempt his onset. I shivered, but stood still.

My patience was at length rewarded. The bear, making one of his short tours into the prairie, espied the carcass of the antelope. I saw that he had halted over something, though I could not tell what, for my eyes were below the level of the plain. Presently, his head was raised again, and in his jaws were the remains of the prong-horn. To my joy, I now perceived that he was dragging it towards the barranca, and in another minute he had disappeared with it behind the cliff.

CHAPTER XXIII.

THE TOUGHEST STRUGGLE OF MY LIFE.

I swam a few strokes, and then wading gently and without noise, I stood upon the sandy shore. With shivering frame and dripping garments, I stood, uncertain what course to pursue. I was upon the opposite side of the lake—I mean opposite to where I had entered it. I had chosen that side intentionally, lest the bear should suddenly return. He might deposit the carcass in his lair, and come back to look after me. It is a habit of these animals, when not pressed by immediate hunger, to bury their food or store it in their caves. Even the eating of the antelope would have been an affair of only a few minutes' time.

The bear might still return, more fierce that he had tasted blood.

I was filled with irresolution. Should I fly off to the plain beyond the reach of pursuit? I should have to return again for my horse and rifle. To take to the prairie on foot would be like going to sea without a boat; but, even had I been sure of reaching the settlements in safety without my horse, I could not think of such a thing. I loved my Moro too well to leave him behind me: I would have risked life itself rather than part with that noble creature. No; the idea of deserting him was not entertained for a moment.

But how was I to join him? The only path by which I could cross the barranca, had just been taken by the bear. He was no doubt still upon it, in the bottom of the ravine. To attempt passing over, would be to bring myself once more under the eyes of the fierce brute; and I should certainly become his victim.

Another idea suggested itself—to go up the barranca, and find another crossing, or else head it altogether, and come down upon the opposite side. That was clearly the best plan.

I was about starting forward to execute it, when, to my dismay, I again beheld the bear; this time, not upon the same side with myself, but upon the opposite one, where Moro was picketed! He was slowly climbing out of the ravine, and, when I first saw him, was dragging his huge body over the escarpment of the cliff. In a moment, he stood erect upon the open plain.

I was filled with a new consternation; I saw too surely that he was about to attack the horse!

The latter had already observed the bear's approach, and seemed to be fully aware of his danger. I had staked him at the distance of about four hundred yards from the barranca, and upon a lazo of about twenty in length. At sight of the bear, he had run out to the end of his trail-rope, and was snorting and plunging with affright.

This new dilemma arrested me, and I stood with anxious feelings to watch the result. I had no hope of being able to yield the slightest aid to my poor horse—at least none occurred to me at the moment.

The bear made directly towards him, and my heart throbbed wildly as I beheld the fierce brute almost within clawing distance. The horse sprang round, however, and galloped upon a circle of which the lazo was the radius. I knew, from the hard jerks he had already given to the rope, that there was no chance of its yielding and freeing him. No; it was a raw-hide lazo of the toughest thong. I knew its power, and I remembered how firmly I had driven home the picket-pin. This I had now cause to regret. Oh, what would I have given to have been able to draw the blade of my knife across that rope!

I continued to watch the struggle with a painful feeling of suspense. The horse still kept out of reach by galloping round the circumference of the circle, while the bear made his attacks by crossing its chords, or running in circles of lesser diameter. The whole scene bore a resemblance to an act at the Hippodrome, Moro being the steed, and the bear taking the part of the ring-master!

Once or twice, the rope circling round, and quite taut, caught upon the legs of the bear, and, after carrying him along with it for some distance, flung him over upon his back. This seemed to add to his rage, as, after rising each time, he ran after the horse with redoubled fury. I could have been amused at the singular spectacle, but that my mind was too painfully agitated about the result.

The scene continued for some minutes without much change in the relative position of the actors. I began to hope that the brute might be baffled after all, and finding the horse too nimble for him, would give over his attempts, particularly as I had noticed the latter

administer several kicks that might have discomfited any other assailant; but these only rendered the bear more savage and vengeful.

Just at this time the scene assumed a new phase, likely to bring about the *dénouement*. The rope had become more pressed against the bear; but this time, instead of trying to avoid it, he seized it in his teeth and paws. I thought at first he was going to cut it, and this was exactly what I wished for; but no—to my consternation I saw that he was crawling along it, constantly renewing his hold, and thus gradually and surely drawing nearer to his victim! The horse now screamed with terror!

I could bear the sight no longer. I remembered that I had left my rifle near the edge of the barranca, and some distance from the horse; I remembered, too, that after shooting the antelope, I had carefully reloaded it. I ran forward to the cliff, and dashed madly down its side; I climbed the opposite steep, and clutching the gun, rushed towards the scene of strife.

I was still in time; the bear had not yet reached his victim, though now within less than six feet of him.

I advanced within ten paces, and fired. As though my shot had cut the thong, it gave way at the moment, and the horse with a wild neigh sprang off into the prairie!

I had hit the bear, as I afterwards ascertained, but not in a vital part, and my bullet had no more effect upon him than if it had been a drop of snipe-shot. It was the strength of despair that had broken the rope, and set free the steed.

It was my turn now, for the bear, as soon as he perceived that the horse had escaped him, turned and sprang upon me, uttering, as he did so, a loud cry. I had no choice but fight. I had no time to reload. I struck the brute once with my clubbed rifle, and flinging the gun away, grasped the readier knife. With the strong keen blade—the knife was a bowie—I struck out before me; but the next moment, I felt myself grappled and held fast. The sharp claws tore up my flesh; one paw was gripped over my hips, another rested on my shoulder, while the white teeth gleamed before my eyes. My knife-arm was free; I had watched this when grappling, and with all the energy of despair, I plunged the keen blade between the ribs of my antagonist. I sought for the heart at every stab.

We rolled together to the ground, over and over again. The red blood covered us both. I saw it welling from the lips of the fierce monster, and I joyed to think that my knife reached his vitals. I was wild—I was mad—I was burning with a fierce vengeance—with anger, such as one might feel for a human foe!

Over and over the ground in the fierce struggle of life and death. 'Again I feel the terrible claws, the tearing teeth; again goes my blade up to the hilt. Gracious powers! how many lives has he? Will he never yield to the red steel? See the blood!—rivers of blood—the prairie is red—we roll in blood. I am sick at the sight—sick—I faint—'

CHAPTER XXIV.

OLD COMRADES.

I fancied myself in a future world, battling with some fearful demon. No; those forms I see around me are of the earth. I still live!

My wounds pain me. Some one is binding them up. His hand is rude; but the tender expression of his eye tells me that his heart is kind. Who is he? Whence came he?

I am still upon the wide prairie; I see that clearly enough. Where is my terrible antagonist? I remember our fierce fight—everything that occurred; but—I thought he had killed me!

I certainly *was* dead. But no; it cannot have been I still live!

I see above me the blue sky—around me the green plain. Near me are forms—the forms of men, and yonder I see horses!

Into whose hands have I fallen? Whoever they be they are friends; they must have rescued me from the gripe of the monster. But how? No one was in sight: how could they have arrived in time? I would ask, but have not strength.

The men are still bending over me. I observe one with large beard and brown bushy whiskers. There is another face, old and thin, and tanned to a copper colour. My eyes wander from one to the other; some distant recollections stir within me. Those faces—Now I see them but dimly—I see them no longer—

I had fainted, and was again insensible. Once more I became conscious, and this time felt stronger: I could better understand what was passing around me. I observed that the sun was going down; but a buffalo robe, suspended upon two upright saplings, guarded his rays from the spot where I lay. My serape was under me, and my head rested in my saddle, over which another robe had been laid. I lay upon my side, and the position gave me a commanding view of all that was passing. A fire was burning near, by which were two persons, one seated, the other standing; my eyes passed from one to the other, scanning each in turn.

The younger stood leaning on his rifle, looking into the fire. 'He was the type of a "mountain man," a trapper. He was full six feet in his moccasins, and of a build that suggested the idea of strength and Saxon ancestry. His arms were like young oaks; and his hand grasping the muzzle of his gun, appeared large, fleshless, and muscular. His cheek was broad and firm, and was partially covered with a bushy whisker, that met over the chin; while a beard of the same colour—dull brown—fringed the lips. The eye was gray, or bluish gray, small, well-set, and rarely wandering. The hair was light brown; and the complexion of the face, which had evidently once been blonde, was now nearly as dark as that of a half-breed. Sun-tan had produced this metamorphosis. The countenance was prepossessing: it might have been once handsome. Its expression was bold, but good-humoured, and bespoke a kind and generous nature.

The dress of this individual was the well-known costume of his class—a hunting-shirt of dressed deer-skin, smoked to the softness of a glove; leggings reaching to the hips, and fringed down the seams; moccasins of true Indian make, soled with buffalo hide (*purflèche*). The hunting-shirt was belted around the waist, but open above, so as to leave the throat and part of the breast uncovered; but over the breast could be seen the under-shirt, of finer material—the dressed skin of the young antelope, or the fawn of the fallow-deer. A short cape, part of the hunting-shirt, hung gracefully over the shoulders, ending in a deep fringe cut out of the buckskin itself. A similar fringe embellished the draping of the skirt. On the head was a racoon-cap—the face of the animal over the front, while the barred tail, like a plume, fell drooping over the left shoulder.

The accoutrements were a bullet-pouch, made from the undressed skin of a tiger-cat, ornamented with the head of the beautiful summer-duck. This hung under the right arm, suspended by a shoulder-strap; and attached, in a similar manner, was a huge crescent-shaped horn, upon which was carved many a strange souvenir. His arms consisted of a knife and pistol—both stuck in the waist-belt—and a long rifle, so straight that the line of the barrel seemed scarcely to deflect from that of the butt.

But little attention had been paid to ornament in either his dress, arms, or equipments; and yet there was a gracefulness in the hang of his tunic-like shirt, a stylishness about the fringing and bead-embroidery, and an air of jauntiness in the set of the 'coon-skin cap, that shewed the wearer was not altogether unmindful of his personal appearance. A small pouch or case, ornamented with stained porcupine quills, hung down upon his breast. This was the pipe-holder—no doubt a *gage d'amour* from some dark-eyed, dark-skinned damsel, like himself a denizen of the wilderness.

His companion was very different in appearance; unlike him—in almost every respect unlike anybody I had ever seen.

The whole appearance of this individual was odd and striking. He was seated on the opposite side of the fire, with his face partially turned towards me, and his head sunk down between a pair of long lank thighs. He looked more like the stump of a tree dressed in dirt-coloured buckskin than a human being; and had his arms not been in motion, he might have been mistaken for such an object. Both his arms and jaws were moving; the latter engaged in polishing a rib of meat which he had half roasted over the coals.

His dress—if dress it could be called—was simple as it was savage. It consisted of what might have once been a hunting-shirt, but which now looked more like a leathern bag with the bottom ripped open, and sleeves sewed into the sides. It was of a dirty-brown colour, wrinkled at the hollow of the arms, patched round the armpits, and greasy all over; it was fairly "caked" with dirt; there was no attempt at either ornament or fringe. There had been a cape, but this had evidently been drawn upon from time to time, for patches and other uses, until scarcely a vestige of it remained. The leggings and moccasins were on a par with the shirt, and seemed to have been manufactured out of the same hide. They, too, were dirt-brown, patched, wrinkled, and greasy. They did not meet each other, but left a piece of ankle bare, and that also was dirt-brown like the buckskin. There was no under-shirt, vest, or other garment to be seen, with the exception of a close-fitting cap, which had once been catskin; but the hair was all worn off, leaving a greasy, leathery-looking surface, that corresponded well with the other parts of the dress. Cap, shirt, leggings, and moccasins, looked as if they had never been stripped off since the day they were first tried on, and that might have been many a year ago. The shirt was open, displaying the naked breast and throat, and these, as well as the face, hands, and ankles, had been tanned by the sun and smoked by the fire to the hue of rusty copper. The whole man, clothes and all, looked as if he had been smoked on purpose.

His face bespoke a man of sixty, or thereabout; his features were sharp, and somewhat aquiline; and the small eyes were dark, quick, and piercing. His hair was black, and cut short; his complexion had been naturally brunette, though there was nothing of the Frenchman or Spaniard in his physiognomy. He was more likely of the black-Saxon breed.

As I looked at this man, I saw that there was a strangeness about him, independently of the oddness of his attire. There was something peculiar about his head—something *wanting*.

What was it that was wanting? It was his ears!

There is something awful in a man without his ears. It suggests some horrid drama—some terrible scene of cruel vengeance: it suggests the idea of crime committed and punishment inflicted.

I might have had such horrid imaginings, but that I chanced to know why those ears were wanting. I remembered the man who was sitting before me!

It seemed a dream, or, rather, the re-enactment of an old scene. Years before, I had seen that individual, and for the first time, in a situation very similar. My

eyes first rested upon him, seated as he was now, over a fire, roasting and eating. The attitude was the same; the *tout ensemble* in no respect different. There was the same greasy catskin-cap, the same scant leggings, the same brown buckskin covering over the lanky frame. Perhaps neither shirt nor leggings had been taken off since I last saw them. They appeared no dirtier, however; that was not possible. Nor was it possible, having once looked upon the wearer, ever to forget him. I remembered him at a glance—Reuben Rawlings, or 'Old Rube,' as he was more commonly called, one of the most celebrated of trappers. The younger man was 'Bill Garey,' another celebrity of the same profession, and old Rube's partner and constant companion.

My heart gladdened at the sight of these old acquaintances. I now knew I was with friends.

I was about to call out to them, when my eye wandering beyond, rested upon the group of horses, and what I saw startled me from my recumbent position. There was Rube's old, blind, bare-ribbed, high-boned, long-eared mare-mustang. Her lank grizzled body, naked tail, and mulish look, I remembered well. There, too, was the large powerful horse of Garey, and there was my own steed Moro picketed beside them! This was a joyful surprise to me, as he had galloped off after his escape from the bear, and I had felt anxious about recovering him; but it was not the sight of Moro that caused me to start with astonishment; it was at seeing another well-remembered animal—another horse. Was I mistaken? Was it an illusion? Were my eyes or my fancy again mocking me? No! It was a reality. There was the noble form, the graceful and symmetrical outlines, the smooth coat of silver white, the flowing tail, the upright jetty ears—all were before my eyes. It was he. *It was the white steed of the prairies!*

MORTALITY.

'And we shall be changed.'

Ye dainty mosses, lichens gray,
Laid cheek on cheek in tender fold,
Each with a soft smile day by day
Returning to the mould;

Brown leaves, that with aerial grace
Slip from the branch like birds a-wing,
Each leaving in the appointed place
Its bud of future spring;

If we, God's sentient creatures, knew
But half your faith in our decay,
We should not tremble as we do
When He calls clay to clay;

But with an equal patience sweet,
We should put off this mortal gear,
In whatsoever new form is meet,
Content to reappear;

Knowing each germ of life He gives
Must have in Him its source and rise;
Being that of His being lives
May change, but never dies.

Ye dead leaves, dropping soft and slow,
Ye mosses green, and lichens fair,
Go to your graves, as I will go,
For God is also there.

MAJOR TRUEFITT ON THE TOO FINE.

REFINEMENT is a very good thing to a certain extent, but it ought not to be carried too far. Human nature we know to be a mixture: besides those intellectual and emotional parts which we cultivate and refine upon, it includes certain animal elements adapted for the rude physical circumstances in which it exists, and serving, indeed, as a needful basis for all the other constituents. In our refining processes, we run a risk of carrying this rough and hardy constituent out of its proper relations; thereby injuring it, making it sickly and silly, and so undermining the whole fabric. I say, then, we should not refine too much.

Let us take a grave analytic view of that pleasant creature of the civilised world—a *lady*. She lives chiefly in a well-furnished house. When she goes abroad, it is in a carriage. She walks little, she has no sort of work that gives exercise to the muscles; the winds of heaven are never allowed to visit her face too roughly. She is consequently a white, soft, slim creature, strikingly different from an average peasant-woman, or a domestic female servant. This elegant being, moreover, insists upon imposing various restraints and obstructions upon her person, with a view to reducing it to a certain ideal which has been conventionally approved of; thus sacrificing to an arbitrary principle of refinement, the healthy play of certain organs essential to the general wellbeing of the system. The consequence is, that she is unfitted for some of the most important functions imposed on her by destiny, breaks down under them, is perhaps cut short in her career, but more probably undergoes a life-long penance of what is called delicate health, useless for any good end in life, and a source of trouble and vexation to all connected with her. I trace all this—and every physiologist will bear me out in the conclusion—to over-refinement upon the material part of our nature. A thing formed roughly to bear a part in a rough process has been taken out of its element, and kept there till its constitutional force was lost. It sinks, of course, under the first shock it encounters. One must pity the unfortunate creature, as she is in a great measure the victim of ignorance and a false system; but I often feel how much condolence is also due to those relatives who have the interesting invalid to take care of, and how much better it would be for herself and others if she had kept nearer the appointed level of human nature, and so escaped a well-known class of evils.

When that sweetly engaging creature, a babe, falls into the keeping of a happy pair, how well it would be

for both parties if the parents would rightly consider what it is! Do, my dear friends, remember that it is only human. Angel as it seems, it is only a little animal—an animal with some fine potentialities dormant within it—but in the meantime, simply, frankly, and honestly, a little animal. Now, as such, it has a sphere of being, and calls for being kept in harmony with certain conditions round about it. It has a rough, hardy part to play, and rough, hardy organs to play it with. Let it remain rough and hardy to a fair extent, and so maintain its natural ability to play its appointed part. I believe it would be better for it to be a cottage-child, reared on pottage, and tumbling from morn to eve on a village-green, than a nurse-tended, pampered denizen of a palace, only allowed to take the air at stated hours in a perambulator, or in a brief dull walk. The problem is the simplest imaginable. Keep the creature in all respects on the level of human nature—the healthful average between the physical and the mental parts of our being—and all will be well. Make it too fine, and you lay for it the foundation of unnumbered dangers.

The great bulk of the men who are engaged in the professions and in the higher fields of mercantile life, are little aware of the dangers of their course. Called on to exercise the intellect chiefly, confined to the study and the counting-room, the physical part of their being gets but a restricted play. It has often occurred to me, in conversing with a studious friend, or an assiduous man of business, to ask whether he ever fully considered that there are such things going on in the world as the digging of ditches, the felling of trees, and the holding of ploughs. If they look abroad, they will see that such things are done—that certain men have the strength to do them, and that certain useful ends are thus attained. It appears, in short, that rough labour, vigorous muscular powers, and consequent good to the commonwealth, are all of them coherent parts of the scheme of Providence. Now, there may be individuals better adapted for hard work than others, or it may be convenient to assign the specially hard work to certain persons, while others undertake softer and more refined tasks. But there are no specific differences in human beings to adapt one to one kind of task, and another to another; there are no beings wholly muscle, or wholly brain. There is but one constitution for all, each example of which involves some proportion of every feature common to the rest. The men whose rôle it is, then, to use the intellect chiefly, have also a muscular system of some degree of force—not well fitted, perhaps, for ditch-digging, but still a muscular system forming an

essential part of their constitution, and requiring to be kept in harmony with the parts of the external world to which it is adapted. They must see to make some use of this clumsy and clogging machine, as they sometimes feel the body to be; otherwise they will have to lay their account with sundry hurtful consequences. If they have no real labour for their arms and their limbs, whereby a useful end may be served, they would do well to take up with some amateur kind, however purposeless. If they dislike digging a garden, let them take to bowling or cricket. Let them at least take rides or walks. Field-sports unfortunately involve an element of inhumanity; yet even field-sports are better than no sports at all. We sometimes wonder at the eagerness of fine gentlemen to get away from their dulcet city-life to a Highland moor or the banks of a Lapland river, there to go through a course of practice attended by most of the hardships of the peasant's lot; but I regard this appetency as in truth the voice of nature proclaiming that man has a physical system which needs exercise, in order that we may be wholly well and happy.

It was perhaps an internal voice of this kind which prompted some of the philosophers of the eighteenth century to propound the startling dogma, that the life of the savage was the only natural and right life. This it certainly is not; but the idea might nevertheless point to some obscure form of truth. The matter, as I apprehend it, is simply this: The ruder material part of our nature is not changed or extinguished by civilisation. It continues, in civilisation, to exist, and to prefer its claims for a suitable exercise and gratification; and these claims must be complied with, if we would maintain the whole fabric in *equilibrium* and in health.

There is a similar philosophy regarding our mental nature. It embraces a wonderful variety of powers, sentiments, and tendencies, applicable to an equally wonderful variety of circumstances and necessities, many of which are homely and inelegant, while others are the opposite. The mind of man, in short, has rough work appointed for it in this world, as well as fine; and it has been constituted accordingly, just as the body was formed for hewing trees as well as the carving of ivory-boxes. When we go too far in mental refinement, there arises a class of evils analogous to those which befall the too delicately treated person. Not merely do we become acutely sensitive to trifling vexations, and unfit to stand the serious shocks which from time to time occur to the most happily placed people, but we grow in selfishness. Everything which does not yield an immediate return of pleasure, is felt to be a *bore*—a peculiar word, the use of which may be considered as perhaps the best exponent of this system of over-refinement in a portion of society. Ceasing to relish simple pleasures, we get few real ones at all. Disdaining simple worth and mediocre attainments, we narrow the social circle in which we may be useful. Surely this our last estate is worse than the first. At the same time, it has never been found that over-refinement subdues any of the irregular passions of the human breast; it only gives them new directions, or teaches how they may be masked. Let us not be too eager to lay bare the moral interior of the man of extreme refinement. On the other hand, is it not universally found in the ordinary world, that there may be a perfect simplicity of life, making as near an approach to innocence as our nature is susceptible of, where refinement has not been carried beyond a medium degree?

I hope, my friends, that these few imperfect observations will not be considered as a declaration of war against refinement. I am a friend, not an enemy, to refinement, and delight to see men and women improving their taste and the style of their manners, when it is done to really good issues. Only let us take care

not to carry the process beyond a healthy point, for then we come in contact with evils worse than those we seek to avoid.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXV.—A QUEER CONVERSATION.

THE surprise, with the exertion I had made in raising myself, overcame me, and I fell back in a swoon. It was but a momentary dizziness, and in a short while I was again conscious. Meanwhile, the two men had approached, and having applied something cold to my temples, stood near me conversing: I heard every word.

'Durn the weemen!' (I recognised Rube's voice); 'thur allers a gittin a fellur into some scrape. Hyar's a putty pickle to be in, an all through a gurl. Durn the weemen! sez I.'

'We-ell,' drawlingly responded Garey, 'pre-haps he loves the gal. They sez she's mighty hansom. Love's a strong feelin, Rube.'

Although I had my eyes partially open, I could not see Rube, as he was standing behind the suspended robe; but a gurgling, clucking sound—somewhat like that made in pouring water from a bottle—reached my ears, and told me what effect Garey's remark had produced upon his companion.

'Cuss me, Bill!' the latter at length rejoined—'cuss me! ef yur ain't as durned a fool as the young fellow himself! Love's a strong feelin! He, he, he—ho, ho, hoo! Wal, I guess it must a be to make sich doctored fools o' reasonable men. As yit, it ain't fooled this child, I reck'n.'

'You never knewd what love wur, old hoss?'

'Thur yur off o' the trail, Bill-ee. I did once—yis; oncest I wur in love, plum to the toe-nails. But thet wur a gurl to git sweet on. Ye-es, thet she wur, an no mistake!'

This speech ended in a sigh that sounded like the blowing of a buffalo.

'Who wur the gal?' inquired Garey after a pause. 'White, or Injun?'

'Injun!' exclaimed Rube, in a contemptuous tone: 'no; I reck'n not, boyee. I don't say thet, for a w'y, an Injun ain't jest as good as a white, an more convaynient she are to git shet of when yur tired o' her. I've hed a good grist o' squaws in my time—befo dozen maybe, an maybe more. This I kin say, an no boatin neyther, thet I never sold a squaw yet for a plug o' bacca less than I gin for her; an on most o' 'em I made a clur profit. Thurfur, Billie, I don't object to an Injun fur a wife: but wives is one thing, an *sweethearts* is diff'rent, when it comes to thet. Now the gurl I'm a-talkin 'bout wur my sweetheart.'

'She wur a white gal, then?'

'Are allyblaster white? She wur white as the bleached skull o' a buffler; an sech har! 'Twur as red as the brush o' a kitfox. Eyes too! Ah, Billie, boy, them wur eyes to squint out o'! They wur as big as a buck's, an as soft as smoked fawn-skin. I never seed a pair o' eyes like hern!'

'What wur her name?'

'Her name wur Char'ty, an as near as I kin remember 'twur Holmes—Char'ty Holmes. Ye-es, thet wur the name. 'Twur upon Big-duck creek in the Tennessee bottom, the place whur this child chawed his fust hoe-cake. Let me see—it ur now more'n thirty year ago. I fust met the gurl at a candy-pullin; an I recollect well we wur put to eat taffy agin one another. We ate till our lips met; an thet the kessin—thet wur kessin, boyee. Char'ty's lips wur sweeter than the candy! We met oncest agin at a corn-shuckin, an arterwards at a blanket-trampin, an thur's whur the business wur done. I seed Char'ty

ankles as she wur a-trampin out the blankets, as white an smooth as peeled poplar. Arter thet turn, all up wi' Reuben Rawlings. I approached the gurl 'thout more ado; an sez I: "Char'ty," sez I, "I freeze to you;" an sez she: "Reuben, I cottons to you." So I immedieantly made up to the ole squire—thet ur Squire Holmes—an axed him for his darter. Durn the ole skunk! he refused to gin her to me!

'Jest then, thur kum a pedlar from Kinneticut, all kivered wi' fine broadcloth. He made love to Char'ty; an wud yur believe it, Bill? the gurl married him! Cuss the weemen! thur all alike.

'I met the pedlar shortly arter, an gin him sech a larrupin as laid him up for a month; but I hed to clur out for it, an I then tuk to the plains. I never seed Char'ty arterward, but I heerd o' her onces from a fellur I kim acroost on the Massoury. She wur a splendid critter; an if she ur still livin, she must hev a good glist o' young uns by this, for the fellur said she'd hed twine shortly arter she wur married, with *her as eyes jest like herself!* Wal, thur's no kalklatin on weemen, any how. Jest see what this young fellur's got by tryin to sarve 'em. Wagh!

Up to this moment I took no part in the conversation, ner had I indicated to either of the trappers that I was aware of their presence. Everything was enveloped in mystery. The presence of the white steed had sufficiently astonished me, and not less that of my old acquaintances, Rube and Garey. The whole scene was a puzzle; I was now equally at a loss to account for their being acquainted with the cause that had brought me there. That they were so, was evident from their conversation. Where could they have procured their information on this head? Neither of them had been at the rancheria, nor in the army anywhere; certainly not, else I should have heard of them. Indeed, either of them would have made himself known to me, as a strong friendship had formerly existed between us.

But they alone could give me an explanation, and, without further conjecture, I turned to them.

'Rube! Garey!' I said, holding out my hands.

'Hilloo! yur a-comin too, young fellur. The't's right; but thur now—lay still a bit—don't worrit yerself; y'll be stronger by 'n by.'

'Take a sup o' this,' said the other, with an air of rude kindness, at the same time holding out a small gourd, which I applied to my lips. It was *aguardiente* of El Paso, better known among the mountain-men as 'Paw-whisky.' The immediate effect of this strong, but not bad spirit, was to strengthen my nerves, and render me abler to converse.

'I see you recollects us, capt'n,' said Garey, apparently pleased at the recognition.

'Well, old comrades—well do I remember you.'

'We ain't forgot you neyther. Rube an I often talked about ye. We many a time wondered what hed become o' you. We heerd, of coorse, that you hed gone back to the settlements, an that you hed come into gobs o' property, an hed to change yur name to git it!'

'Durn the name!' interrupted Rube. 'I'd change mine any day for a plug o' Jeemes River bacca; that wud I sartint.'

'No, capt'n,' continued the younger trapper, without heeding Rube's interruption, 'we hedn't forgot you, neyther of us.'

'That we hedn't!' added Rube emphatically: 'forgot ye—forgot the young fellur as tuk ole Rube for a grizzly! He, he, he!—ho, ho, hoo! How Bill hyur did lart when I gin him the account o' that bishness in the cave. Bill, boy, I niver seed you lart so in all my life. Ole Rube tuk for a grizzly! He, he, he!—ho, ho, hoo!'

And the old trapper went off into a fit of laughing that occupied nearly a minute. At the end of it, he continued:

'Thet wur a kewrious bit o' dodgin—wa'nt it, young fellur? You saved my ole karkidge thet time, an I ain't a-gwine to forgit it; no, this child ain't.'

'I think you have repaid me; you have rescued me from the bear?'

'From one bar preehaps we did, but from t'other grizzly you reacoosed yerself; an, young fellur, you must a fit a putty consid'able bout afore the vamin't knocked under. The way you hev gin him the bowie ur a caution to snakes, I reck'n.'

'What? were there two bears?'

'Look thur! thur's a kuppel, ain't thur?'

The trapper pointed in the direction of the fire. Sure enough, the carcasses of two bears lay upon the ground, both skinned, and partially cut up!

'I fought with only one.'

'An thet wur enuf at a time, an a leetle more, I reck'n. 'Tain't many as lives to wag thur jaws arter a stan-up tussle wi' a grizzly.' Wagh! how you must have fit, to a rubbed out thet bar!'

'I killed the bear, then?'

'Thet you sartintly did, young fellur. When Bill an me kim on the groun, the bar wur as dead as pickled pork. We thort yur case wa'nt any better. Thur you lay a-huggin the bar, an the bar a-huggin you, as ef both on yur hed gone to sleep in a sort o' friendly way, like the babbies in the wood. But thur wur yur claret a kiverin the paraira for yurds round. Thur wa'nt as much blood in you as wud a gin a leech his breakfast.'

'The other bear?'

'She kum arterwards out o' the gully. Bill, he wur gone to look arter the white hoss. I wur sittin by you, jest hyur, when I seed the vamin't's snout pokin up. I knowd it wur the she-bar a-comin to see where ole Eph had strayed to. So I tuk up Targuta, an plummed the critter in the eye, an thet wur the cend o' her trampin.

'Now, lookee hyur, young fellur! I ain't no doctur, neyther's Bill, but I knows enough about wounds to be sartint thet you must lay still, an stop talkin. Yur mighty bad scratched, I tell ye, but yur not dangerous, only you've got no blood in yur body, an you must wait till it gathers agin. Take another suck out o' the gourd. Thur now, come, Billes! leave 'im alone. Le's go an hev a fresh tooth-full o' bar-meat.'

And so saying, the leathery figure moved off in the direction of the fire, followed by his younger companion.

Although I was anxious to have a further explanation about the other points that puzzled me—about the steed, the trappers' own presence, their knowledge of my wild hunt, and its antecedents—I knew it would be useless to question Old Rube any further after what he had said; I was compelled, therefore, to follow his advice, and remain quiet.

CHAPTER XXIV.

VOYS OF VENGEANCE.

I soon fell asleep again, and this time slept long and profoundly. It was after nightfall, in fact, near midnight, when I awoke. The air had grown chilly, but I found I had not been neglected; my serape was wrapped closely around me, and with a buffalo-robe, had sufficiently protected me from the cold while I slept. On awaking, I felt much better and stronger. I looked around for my companions. The fire had gone out—no doubt intentionally extinguished, lest its glare amid the darkness might attract the eye of some roving Indian. The night was a clear one, though moonless; but the heaven was spangled with its sparkling worlds, and the starlight enabled me to make out the forms of the two trappers and the group of browsing horses. Of the former, one only was asleep; the other sat upright, keeping guard over the camp. He was motionless

as a statue; but the small spark gleaming like a glowworm from the bowl of his tobacco-pipe, gave token of his wakefulness. Dim as the light was, I could distinguish the upright form to be that of the earless trapper. It was Garey who was sleeping.

I could have wished it otherwise. I was anxious to have some conversation with the younger of my companions; I was longing for an explanation, and I should have preferred addressing myself to Garey. My anxiety would not allow me to wait, and I turned towards Rube. He sat near me, and I spoke in a low tone, so as not to awake the sleeper.

'How came you to find me?'

'By follerin yur trail.'

'Oh, you followed me then! From the settlements?'

'Not so fur. Bill an me wur camped in the chapparil, an spied you a gallupin arter the white hoss, as ef all the devils wur arter you. I knowd yur at a glimp; so d'd Bill. Sez I: "Bill, thet ur the young fellur as tuk me for a grizzly up thur in the mountains," an the reckoleckshun o' the sark'mstance sot me a larfin till my ole ribs ached. "It ur the same," sez Bill. An jest then, we met a Mexikin who hed been yur guide, gallupin about in sarch o' you. He gin us a story 'bout some gurl thet hed sent you to catch the white hoss; some saynora with a dodrotted long name. "Durn the weemen!" sez I to Bill. Didn't I, Bill?'

To this interesting interrogatory, Garey, who was but half asleep, gave an assenting grunt.

'Wal,' continued Rube, 'seem thur wur a pettycoat in the case, I sez to Bill, sez I: "Thet young fellur ain't a-gwine to pull up till eyther he grups the hoss, or the hoss gits clur off." Now, I knowd you wur well mounted, but I knowd you wur arter the fastest critter on all these parairas; so I sez to Bill, sez I: "Billee, thur boun for a long gallup." Sez Bill: "Thet ur sartin." Wal! Bill an me tuk the idee in our heads, thet you mout git lost, for we seed the white hoss wur a makin for the big paraira. It ain't the biggest paraira in creashun, but it ur one of the wust to git strayed on. Yur greenhorns wur all gone back, so Bill an me catched up our critters, an as soon as we kud saddle 'em, put arter you. When we kumd out in the paraira, we seed no signs o' you, 'ceptin yur trail. Thet we follered up; but it wur night long afore we got half way hyur, an wur obleeged to halt till sunup.

'In the mornin, the trail wur nurly blind, on account o' the rain; an it tuk us a good spell afore we reached the gully. "Thur," sez Bill, "the hoss hes jumped in an hyur's the trail o' the young fellur leadin down the bank." Wal, we wur jest turnin to go down, when we seed yur own hoss a good ways off on the paraira, 'ithout saddle or bridle. We rid straight for him, an when we got closter, we seed somethin on the groun, right under the hoss's nose. Thet somethin turned out to be yurself an the grizzly, lyin in grups, as quiet as a kuppel o' sleepin 'possums. Yur hoss wur a squealin like a bag o' wild-cats, an at fust Bill an me thort you hed gone under. But upon a closter view, we seed you wur only a faintin, while the bar wur as dead as a buck. Of coorse we sot about doctorin you, to fotch you roun agin.'

'But the steed? the white steed?'

'Bill hyur grupped him in the gully. A leetle further down it's stopped up wi' big rocks. We knowd thet, for we'd been hyur afore. We knowd the hoss kudn't a got over the rocks, an Bill went arter an foun him, on a ledge whur he hed clomb out o' reech o' the flood; an then he lazooed the critter, an fotchd 'im up hyur. Now, young fellur, you hev the hul story.'

'An the hoss,' added Garey, rising from his recumbent position, 'he's yourn, capt'n. Ef you hadn't rid him down, I couldn't a roped him so easy. He's yourn, ef yu 'll accept him.'

'Thanks, thanks! not for the gift alone, but I may thank you for my life. But for you, I might never have left this spot. Thanks! old comrades, thanks!'

Every point was now cleared up. There was mystery no longer, though, from an expression which Garey had dropped, I still desired a word with him in private.

On further inquiry, I learned that the trappers were on their way to take part in the campaign. Some barbarous treatment they had experienced from Mexican soldiers at a frontier post, had rendered both of them inveterate foes to Mexico; and Rube declared he would never be contented until he had 'plugged a score of the yellur-hidden vamints.' The breaking out of the war gave them the opportunity they desired, and they were now on their way, from a distant part of prairie-land, to take a hand in it.

The vehemence of their hostility towards the Mexicans somewhat surprised me—as I knew it was a recent feeling with them—and I inquired more particularly into the nature of the ill-treatment they had received. They answered me by giving a detailed account of the affair. It had occurred at one of the Mexican frontier towns, where, upon a slight pretext, the trappers had been arrested and flogged, by order of the commanding officer of the post.

'Yes-a!' said Rube, the words hissing angrily through his teeth; 'yes-a, flogged!—a mountain-man flogged by a cussed monkey of a Mexikin! Ne'er a mind! ne'er a mind! By the 'tarnal!—an when I say thet, I swar it—this nigger don't leave Mexiko till he hes rubbed out a soger for every lash they gin him—as that's twenty!'

'Hyur's another, old hoss!' cried Garey, with equal earnestness of manner—'hyur's another that swar the same oath!'

'Yes, Billee, boy! I guess we 'll count some in a skrimmage. Thur's two a'ready! lookee thur, young fellur!'

As Rube said this, he held his rifle close to my eyes, pointing with his finger to a particular part of the stock. I saw two small notches freshly cut in the wood. I knew well enough what these notches meant; they were a registry of the deaths of two Mexicans, who had fallen by the hand or bullet of the trapper. They had not been the only victims of that unerring and deadly weapon. On the same piece of wood-work I could see long rows of similar *souvenirs*, apart from each other, only differing a little in shape. I knew something of the signification of these horrible hieroglyphics; I knew they were the history of a life fearfully spent—a life of red realities.

The sight was far from pleasant. I turned my eyes away, and remained silent.

'Mark me, young fellur!' continued Rube, who noticed that I was not gratified by the inspection; 'don't mistake Bill Garey an me for wild beasts; we ain't thet quite: we've been mighty riled, I reck'n; but fr all thet we ain't a-gwine to take revenge on weemen an childer, as Injuns do. No—weemen an childer don't count, nor men neyther, unless thur sogers. We've no spite agin the poor alaves o' Mexiko. They never did me nor Bill harm. We've been on one skurry, along wi' the Yutawa, down to the Del Nort settlements. Thur's whur I made them two nicks; but neyther Bill or me laid a finger on the weemen an childer. It wur bekaase the Injuns did, thet we left 'em. We're jest kum from thur. We want fair fight among Christyun whites; thet's why we're hyur. Now, young fellur!'

I was glad to hear Rube talk in this manner, and I so signified to him. Indianised as the old trapper was, with all his savageness, all his reckless indifference to ordinary emotions, I knew there was still a touch of humanity in his breast. Indeed, on more than one occasion, I had witnessed singular displays

of fine feeling on the part of Rube. Circumstanced as he was, he is not to be judged by the laws of civilised life.

'Your intention, then, is to join some corps of rangers, is it not?' I asked after a pause.

'I shed like it,' replied Garey: 'I shed like to join your company, cap'n; but Rube hyur won't consent to it.'

'No!' exclaimed the other with emphasis; 'I'll jine no kumpny. This niggur fights on his own hook. Yur see, young fellur, I hev been all my life a free mountanee-man, an don't understan sogerin, no how. I mout make some mistake, or I moutn't like some o' the regilashuns; thurfor I prefers fightin arter my own fashun. Bill an me kin take care o' ourselves, I reck'n. Kin we, Bill?—eh, boyee?'

'I guess so, old hoss,' replied Garey mildly; 'but for all that, Rube, I think it would be better to go at it in a reglar way—particularly as the cap'n hyur would make the sogerin part as easy as possible. Wudn't yur, cap'n?'

'The discipline of my corps is not very severe. We are *Rangers*, and our duties are different from those of regular soldiers'—

'It ur no use,' interrupted Rube; 'I must fight as I've allers fit, free to kum an free to go whur I please. I won't bind myself. I moutn't like it, an mout desart.'

'But by binding yourself,' suggested I, 'you draw pay and rations; whereas'—

'Durn pay an rashuns!' exclaimed the old trapper, striking the butt of his rifle upon the prairie. 'Durn pay an rashuns! Young fellur, I fights for revenge!'

This was said in an energetic and conclusive manner, and I urged my advice no further.

'Look hyur, cap!' continued the speaker in a more subdued tone. 'Though I ain't a-gwine to jine yur fellurs, yet thur ur a favor I wud axe from yur; an that is, to let me an Bill keep by you, or foller whur-iver you lead. I don't want to sponge for rashuns; we'll git thet ef thur's a head o' game in Mexiko, an ef thur ain't, why we kin eat a *Mexikin*. Can't we, Bill?—eh, boyee?'

Garey knew this was one of Rube's jokes, and laughingly assented; adding at the same time, that he would prefer eating any other 'sort o' varmint.'

'Ne'er a mind!' continued Rube; 'we ain't a-gwine to starve. So, young fellur, ef you agrees to our goin on them tarmz, yu'll heve a kuppel o' rifles near you thet won't miss fire—they won't.'

'Enough! You shall go and come as you please. I shall be glad to have you near me, without binding you to any term of service.'

'Hooray!—thet's the sort for us! Kum, Billee!—gie's another suck out o' yur gourd. Hyur's success to the Stars and Stripes! Hooray for Texas!'

CHAPTER XXVII.

A 'WEED'-PRAIRIE ON FIRE.

My recovery was rapid. My wounds, though deep, were not dangerous; they were only flesh-wounds, and closed rapidly under the cauterising influence of the *lechuguilla*. Rude as my doctors were, in the matter of such a malady, I could not have fallen into better hands. Both, during their lives of accident and exposure, had ample practice in the healing art; and I would have trusted either, in the curing of a rattlesnake's bite, or the tear of a grizzly bear's claw, in preference to the most accomplished surgeon. Old Rube, in particular, thoroughly understood the simple pharmacopœia of the prairies; and his application to my wounds of the sap of the *pita* plant, obtained among the rocks of the ravine, bespoke his skill. This plant, a *bromelia*, is of the same genus as the *Agave Americana*, and by travellers often confounded with the latter,

though quite a distinct plant from the *maguay* of cultivation. It grows in most parts of Mexico and South America, extending as far north as the latitude of 30°, and even further. There is no spot too arid or barren to give support to it. It is a true desert plant; and even on the naked rock, its curved and thorny blades may be seen radiating on all sides from the tall flower-stalk, that shoots upward like a signal-staff, to the height of twenty feet. As already observed, its uses are manifold: the fibre of its leaves can be manufactured into thread, cordage, and cloth; fences are constructed of the growing plant, and thatch of the blades when cut; its sap, distilled, furnishes the fiery but not unwholesome *mezcal*; and the large egg-shaped core or stem is eaten for food. Tribes of Indians—Lipans, Comanches, and Apaches—use it extensively as an article of diet. One branch of the great Apache nation are distinguished as '*Mezcaleros*' (eaters of the *mezcal*-plant). They bake it in ground-ovens of heated stones, along with the flesh of the wild-horse. It is firm when cooked, with a translucent appearance like candied fruits. I have eaten it; it is palatable—I might say delicious. The mastication of it is accompanied by a prinkling sensation upon the tongue, singular to one unaccustomed to it. It is a gift of nature to the desert regions, where it grows in greatest luxuriance, and where it serves the same purpose in the economy of the savage natives as the *ixias*, *mesembryanthemums*, and *zamas* (the Caffre bread), upon the arid karoo of Southern Africa.

One of the most esteemed qualities of this *bromelia* is the cauterising property of its juice, well known to the natives of the Mexican table-land, and to the Peruvians, where several species are found of like virtues. It will cause ordinary wounds to cicatrise in a few hours, and even 'ugly gashes' will yield to it in time.

My companions had full knowledge of its effects, and having extracted the sap from its large succulent leaves, and boiled it to the consistency of honey, they applied it to my wounds. This operation they from time to time repeated, and the scratches were healed in a period marvellously short. My strength, too, was soon restored. Garey with his gun catered for the cuisine, and the ruffed grouse, the prairie partridge, and roasted ribs of fresh venison, were dainties even to an invalid.

In three days I was strong enough to mount; and bidding adieu to our camping-ground, we set forth, taking with us our beautiful captive. He was still as wild as a deer; but we adopted precautions to prevent him from getting off. The trappers led him between them, secured to the saddles of both by a lazo.

We did not return in the direction of our old trail; my companions knew a shorter route, at least one upon which we should sooner reach water, and that is the most important consideration on a prairie-journey. We headed in a more westerly direction; in which, by keeping in a straight line, we should strike the Rio Grande some distance above the rancheria.

The sky was leaden-gray, the sun not being visible, and with no guide in the heavens, we knew that we might easily diverge from a direct course. To provide against this, my companions had recourse to a compass of their own invention. On taking our departure from camp, a sapling was stuck into the ground, and upon the top of this was adjusted a piece of bear's-skin, which, with the long hair upon it, could be distinguished at the distance of a mile or more. The direction having been determined upon, another wand, similarly garnished with a tuft of the bear's-skin, was set up several hundred yards distant from the first.

Turning our backs upon these signal-posts, we rode off with perfect confidence, glancing back at intervals to make sure we were keeping the track. So long as they remained in sight, and aligned with each other,

we could not otherwise than travel in a straight path. It was an ingenious contrivance, but it was not the first time I had been witness to the 'instincts' of my trapper-friends, and therefore I was not astonished.

When the black tufts were well-nigh hidden from view, a similar pair—the materials for which had been brought along—were erected, and these insured our direction for another stretch of a mile; then fresh saplings were planted; and so on, till we had passed over some six miles of the plain.

We now came in sight of timber right ahead of us, and apparently about five miles distant. Towards this we directed our course.

We reached the timber about noon, and found it to consist of black-jack and post-oak groves, with mezquite and wild-china trees interspersed, and here and there some taller trees of the honey-locust (*Gleditsia triacanthos*).

It was not a close forest, but a succession of groves, with openings between—avenues and grassy glades. There were many pleasant spots, and, faint with the ride, I would fain have chosen one of them for a resting-place; but there was no water, and without water we could not halt. A short distance further, and we should reach a stream—a small *arroyo*, an affluent of the Rio Grande. So promised my companions, and we rode onward.

After passing a mile or so through the timber-openings, we came out on the edge of a prairie of considerable extent. It was full three miles in diameter, and differed altogether from the plain we had left behind us. It was of the kind known in hunter phraseology as a 'weed-prairie'—that is, instead of having a grassy turf, its surface was covered with a thick growth of flowering-plants, as *helianthus*, *malvas*, *althæas*, *hibiscus*, and other tall annuals standing side by side, and frequently laced together by wild-pea vines and various species of convolvulus. Such a flower-prairie was the one now before us, but not a flower was in sight; they had all bloomed, faded, and fallen, perhaps unseen by human eye, and the withered stalks, burned by a hot sun, looked brown and forbidding. They cracked and broke at the slightest touch, shelling their seed-pods like rain upon the loose earth.

Instead of striking across this prairie, we skirted around its edge; and at no great distance, arrived on the banks of the arroyo which ran along one side.

We had made but a short march; but my companions, fearful that a longer ride might bring on fever, proposed to encamp there for the night, and finish our journey on the following day. Though I felt strong enough to have gone further, I made no objection to the proposal; and our horses were at once unsaddled and picketed near the banks of the arroyo.

The stream ran through a little bottom-valley covered with a sward of grass, and upon this we staked our steeds; but a better place offered for our camp upon the higher ground; and we chose a spot under the shade of a large locust-tree, upon the edge of the great wilderness of weeds. To this place we carried our saddles, bridles, and blankets, and having collected a quantity of dead branches, kindled our camp-fire. We had already quenched our thirst at the stream, but, although we were all three hungry enough, the dried flesh of the grizzly bear proved but a poor repast. The rivulet looked promising for fish. Garey carried both hooks and line in his 'possible sack,' and I proposed the angle.

The young trapper soon baited his hooks; and he and I, repairing to the stream, cast our lines, sat down, and waited for a nibble.

Fishing was not to Rube's taste. For a few minutes he stood watching us, but evidently with little interest, either in the sport, or what it might produce. Rube was not a fish-eater.

'Durn yur fish!' exclaimed he at length: 'I'd rather hev a hunk o' deer-meat than all the fish in Texas. I'll jest see ef I kin scare up somethin'; the place looks likely for deer—it do.'

So saying, the old trapper shouldered his long rifle, and stalking away up the bank, was soon out of sight.

Garey and I continued bobbing with but indifferent success. We had succeeded in drawing out a couple of cat-fish, not the most palatable of the finny tribe, when the crack of Rube's rifle sounded in our ears. It seemed to come from the weed-prairie, and we both ran up on the high bank to ascertain what success had attended the shot. Sure enough, Rube was out in the prairie, nearly half a mile distant from the camp. His head and shoulders were just visible above the tall stalks of the *helianthus*; and we could see, by his stooping at intervals, that he was bending over some game he had killed, skinning or cutting it up. The game we could not see, on account of the interposed stalks of the weeds.

'A deer, I reck'n,' remarked Garey. 'Buffle don't often o' late years stray so far to the south, though I've killed some on the Grande, higher up.'

Without other remark passing between us, we descended to the arroyo, and continued our fishing. We took it for granted that Rube did not require any aid, or he would have signaled to us. He would soon return with his game to the camp.

We had just discovered that silver-fish (a species of *hyodon*) were plentiful in the stream, and this attracted us back. We were desirous of taking some of them for our dinner, knowing them to be excellent eating, and far superior to the despised 'cat.'

Having changed our bait for some small pieces of gold-lace, which my uniform furnished, we succeeded in pulling several of these beautiful creatures out of the water; and were congratulating one another upon the delicious broil we should have, when our conversation was suddenly interrupted by a crackling noise, that caused both of us to turn our faces towards the prairie. The sight that met our eyes prompted us to spring simultaneously to our feet. Our horses already reared upon their lazeos—neighing with affright—and the wild screams of Rube's mustang mare were loud and continuous. There was no mystery about the cause; that was obvious at a glance. The wind had blown some sparks among the dry flower-stalks. The prairie was on fire!

Though startled at the first sight of the conflagration, for ourselves we had nothing to fear. The bottom on which we stood was a sward of short buffalo-grass; it was not likely to catch fire, and even if it did, we could easily escape from it. There is not much danger in a burning prairie where the grass is light and short; one can dash through the line of flames with no further injury than the singeing of his hair, or a little suffocation from smoke; but upon a plain covered with rank and thick vegetation, the case is very different. We therefore felt no apprehensions for ourselves, but we did for our companion; his situation filled us with alarm.

Was he still where we had last seen him? This was the first question we asked one another. If so, then his peril was great indeed; escape would be almost hopeless! We had observed him a full half mile out among the weeds. He was on foot too. To have attempted a retreat towards the opposite side of the prairie, would have been folly: it was three miles off. Even on horseback, the flames would have overtaken him! Mounted, or on foot, he could not have got out of the way through those tall stalks—laced as they were by pea-vines and other trailing plants—whose tough tangle would have hindered the progress of the strongest horse!

To have returned to the near side would be his only chance; but that would be in the very face of

the fire, and, unless he had started long before the flames broke out, it was evident that his retreat in that direction would be cut off. As already stated, the weeds were as dry as tinder; and the flames, impelled by gusts of wind, at intervals shot out their red tongues, licking up the withered stalks, coiling like serpents around them, and consuming them almost instantaneously.

Filled with forebodings, my companion and I rushed in the direction of the prairie.

When first noticed by us, the fire had extended but a few yards on each side of the locust-tree we had chosen for our camp. We were not opposite this point at the moment, having gone a little way down the arroyo; we ran, therefore, not towards the camp, but for the nearest point of high ground, in order to discover the situation of our friend. On reaching the high ground, about two hundred yards from the locust, we saw to our astonishment that the fire had already spread, and was now burning forward to the spot where we had climbed up! We had only a moment to glance outward, when the conflagration, hissing and crackling as it passed, rolled in front of us, and with its wall of flame shut off our view of the prairie.

But that glance had shewn us all, and filled our hearts with sorrow and dismay; it revealed the situation of the trapper—no longer a situation of peril, but, as we supposed, of certain death! He was still in the place where we had last seen him; he had evidently made no attempt to escape from it. Perhaps the knowledge that such an attempt must have failed, had hindered him from making it. The reflection that he might as well die where he stood, as be licked up by the flames in the act of fleeing from them, had bound him to the spot!

Oh! it was a dread sight to see that old man, hardened sinner that he was, about to be snatched into eternity! I remember his wild look, as the red flame, rolling between us, shut him from our sight! We had seen him but for a single instant: his head and shoulders were alone visible above the tall weeds. He made no sign either with voice or arm; but I fancied that even at that distance I could read his glance of despair.

Was there no hope? Could no exertion be made to rescue him? Could he do nothing for himself? Was there no chance of his being able to clear a circle round him, and burn off a space before the line of fire could come up? Such a ruse has often availed, but no—never in such ground as that! The weeds were too thick and tall—it could not be done—Garey said it could not be done.

There was no hope, then. *The trapper was lost!*

A FÊTE AT TZARSKO-SELO.

No one who has not tried it can conceive an idea of anything much more tiresome than St Petersburg in summer. Ennui is the prevailing sensation, and the all-expressive word by which to describe it. So soon did that terrible ennui seize upon us, and weigh down our spirits and depress even our bodily powers, that before we were settled here—that is to say, before we had given up our passports, and taken out our billet of residence—we were occupied only by the thought of getting away from this city of white houses and stately monotony.

It was a foolish thought, yet we acted upon it, and flew off to Tzarsko-Selo—which word means the seat, or village, of the czar—about twenty-five versts from the capital. A verst is three-quarters of an English mile; and as the railway brings the citizens there two or three times a day, it forms a very pleasant and favourite excursion, especially for strangers.

When the emperor is there, and in summer-time, the

difficulty of getting lodgings is extreme, and the price paid for them exorbitant. All the pretty wooden houses that form the village of the czar, are occupied by the followers of the court, or the officers and their families. We got a sufficiently wretched abode in the house of a man who had been an English boy till he was ten years old, but having then gone to sea in the service of Alexander I., he had grown into a personage very common in Russia, and very disagreeable in general, because it usually happens that the best qualities of the natives to whom they assimilate are not those which they adopt. We have met others, however, of this class to whom the observation would apply much more than it does to this old seaman, whose Russian wife, though married to an Englishman for more than thirty years, could not comprehend the least word of our language. How English blood can ever become so changed as to make an Englishman tolerate a Russian housewife, is rather mysterious. For my part, I will only venture to relate that, having discovered the double purpose to which the store-room was put, where were kept the butter, cheese, milk, preserves, and most other articles of daily consumption, I made a silent resolve never to eat a morsel of any similar things that I did not purchase and bring into our rooms myself.

Hardly were we located in our new abode than we left it in order to get into the park of Tzarsko-Selo. The hope of shade after the uniform glare of St Petersburg was reviving. We took a wrong direction, or rather wrong entrance, which, after a long circuit, suddenly led us into the midst of a quite unexpected scene.

We were ignorant that it was the festival of the fine regiment of guards whose white uniform and dark faces now appeared ranged in a line on the grass before us. It was the festival of their patron saint to whom the regiment is dedicated, and therefore a festival to them.

The spectacle was a curious and very striking one, not the less so for being also a surprising one to us. A picked body of men stood in line; I think there was not a quarter of an inch variation in the equality of their uncovered heads. They held their glittering helmets in their hands; and close before them stood a tall, fair, comely officer, in the prime of life, but with a look of care on his brow, an expression on his face that impressed one with the idea that he was employed in a service he disliked—serving against the grain, as we say. I looked at him with interest, for I thought that he did not like the service of Russia—that he would be glad to throw off the white uniform he wore—that he was perhaps a Pole, or one of the many fragmentary parts that willingly or unwillingly compose that mighty empire.

The whole green space was dotted over, and in the background thronged, with more splendid and varied uniforms, and many of the finest figures that could be seen were set off by more gorgeous equipments. None struck me as having the same expression as the officer who stood before the troops—an expression hard to describe, otherwise than that of distaste to the life he led. But a bell sounded; this officer took off his helmet, turned round, and accidentally cast his eye on me. I met that full blue eye direct, and almost exclaimed aloud: 'The emperor! the czar himself.'

What is there in an eye accustomed to power that makes itself felt? There were far more dashing uniforms, far more commanding figures present, but there was no eye that, when it looked full at you, had the same force, conveyed the same sense of power.

A gentleman who joined us, said he had not seen the czar for eighteen months, and would scarcely have known him, so much was his countenance and general appearance altered. The ruler of such an empire, and of such a one, too, when engaged in a miserable war,

must have known enough in these eighteen months to mark his brow with care, and his countenance with dissatisfaction. On turning round, and uncovering his head, as I have said, the Emperor Alexander II. walked with helmet in hand to a gay-looking little tent, in which an altar was placed, and from which now issued the exquisite voices of the priests and choir singing the appropriate service for a festival, which, like most Russian ones, was half religious, half military. He stood there while it lasted. Of the officers outside, I saw a few, a very few, bless themselves, and bow at stated times; but the generality paid no sort of attention to what was going on. The soldiers crossed themselves, and bowed their heads occasionally, and the movement, when made simultaneously, had a curious effect.

As soon as the service was over, and while the choir still sang, a green and gold covered priest, with long hair streaming to his waist behind, and long beard flowing down before, came half flying from the tent, so quickly did he move along, followed by his obedient master, the tzar of All the Russias. The priest bore in one hand a basin of holy-water, and carried the *asperge*—I must use a French term, not knowing the English one—in the other. He dipped this sort of brush or twig in the water, and flung it at each soldier's face. They stood this remarkably well, in only one or two instances winking the eyes as the water was jerked at them; their imperial master witnessing their behaviour as he walked along the line with the priest.

The whole was to us a novel and a remarkable scene: the sun shining full on the glittering helmets, which were held in an even line; the wild-looking priest, with his un-European air; and the mechanical-looking tzar, who seemed to inspect this performance of the blessing of the soldiers.

After it was over, the emperor very kindly walked down the group—a very small one—of spectators, in order to shew himself, or give them the opportunity of getting a military salute in return for their salutations. They drew back as he passed, but did not make any other demonstration of respect. For our parts, we bowed, as we do in England, very deeply, which obtained us not only a salute, but another cast from that lordly eye, which somehow sinks straight into the mind, and is not forgotten. What must have been such a one from that true type of an autocrat, the Emperor Nicholas, if that of the mild, benevolent-tempered Alexander is felt! It was not imagination that caused me to trace on that countenance the expression of a mind or disposition that would have naturally found its congenial sphere in other employments, or another sphere than these the duties of a position prescribed. I did not know whose countenance it was that I thus expounded, and I was told afterwards that it had greatly changed since the time when the Emperor Nicholas I. left to his son such a heritage of care as the crown of Russia must be to a thoughtful mind or a benevolent heart. After the troops were blessed, they were feasted in the palace court, and we went away. A day or two after, I began to think my physiognomical science had been at fault.

Harry and I were walking in the park, and admiring a splendid, perfectly white Newfoundland dog, and an equally pretty, in its degree, white Italian greyhound. An officer and lady approached: he wore the loose gray overcoat now prescribed to officers as well as soldiers, and a round red cloth cap, like what is called a smoking-cap, on his head; in his hand he held a half-consumed cigar. A tall lady, in a plain shawl and very plain straw-bonnet, by no means of a fashionable shape, since it did not merely cover the back of her head, leaned on his arm. They were chatting and smiling together. A more perfectly free-from-care couple one could not see. The white Newfoundland dog, with its tail like an immense ostrich plume,

attracted more of my notice: it was only in the act of passing that I met once more the full blue eye, and felt again whose it was, but felt it differently, for the face no longer seemed to say: 'Pity, as well as fear me.' Harry, who was a little behind, drew up and said: 'That lady smiled at me, and I never saw her before.'

'Do you not know who she is?'

'Not in the least.'

'That lady is the Empress of Russia—the tzarina.'

A lengthened O! and then a look of profound thought on Harry's face, followed the information. Could that careless, happy-looking man be the same we had seen so shortly before? It was the same; and in the different aspect perhaps a clue to the native character of the individual might be found. When I related this to a lady afterwards, she accounted for the former expression I had noticed by remarking that it was on that day he had received the new British minister, Lord Wodehouse, who had come to St Petersburg on the conclusion of the war. But surely this reception was more likely to remove than to increase the frown of care and dissatisfaction from the imperial brow.

The grounds of Tzarsko-Selo, though artificial, as everything here is, afford a delightful escape from St Petersburg. There is more than a chance of losing one's self, too, in them, an accident which can by no manner of means happen to you in that straight, clear, and conveniently built capital. An artistic gentleman, with something of an Irish mind, having the organ of disorder instead of that of order in his head, told me he could not enjoy Tzarsko because not a leaf was allowed to wither on the ground, and all the walks were swept and re swept all day long. Notwithstanding that this is a fact, I did enjoy it; although, having thoughtlessly carried in my hand a little broken flower, I found it excite the attention of two royal keepers, who gazed upon it most suspiciously.

In the evening, we took as our guide through the extensive and labyrinthine grounds a little serving-maid, whose cheerful, smiling face, and friendly, sociable manner had not the least affinity to our English notion of the Russian serf—the white slave; and indeed, abhorrent as the system is, our common notion of its subjects is a sort of serious caricature.

Gaiety is not a natural attribute of the Russian character, nor of the Russian countenance; on the contrary, even when smiling or laughing, there is, in the expression of the Russian peasants, who alone may now be considered as purely Russian, a something of gravity, or rather melancholy, which is generally indicative of feeling, although they are perhaps peculiarly exempt from that characteristic.

We found a band playing upon the terrace beside the palace, and a great many persons of all ranks walking there—the low and the high together. To this spot our Russian maid was most partial; but our object being a ramble through trees, and an escape from human beings, we contrived to draw her away from the promenade, although to her evident perplexity, as she seemed to think we must be acting under some misapprehension. It is surprising, however, how quickly intelligent these peasants are, and with how much comparative ease they will comprehend what might puzzle a higher order of English intellect. The only really stupid servant I met in Russia was a Pole; but even this Pole, I recollect, was surpassed in dulness by a German. What the Russian peasantry might be made of by cultivation, must be apparent to the strangers who see them in their present more than half-barbaric state.

Tzarsko-Selo is the principal, and, it appears, favourite summer palace of the tzars. The great Peter was its founder, and indulged here also in his

favourite fancy of tree-planting: the avenues of plane-trees are said to have been planted by his own hand. Everything Russian is, however, doomed to be at one time or other destroyed by fire; and so, though added to and adorned by Elizabeth and Catherine, the palace was re-edified by Alexander I., who re-dedicated the monuments which Catherine II. had erected to her favourites, to his brave comrades in arms.

Our host told us, as we walked in these most magnificent gardens, that each berry, or fruit the size of the top of his finger, which the tsar ate cost him 100 rubles (L.15) a year. They say that the bare expense of keeping the walks and gardens in the beautiful order in which they are constantly preserved, amounts to 100,000 rubles annually. It is consoling to know, that the old and invalid soldiers, whose only other portion would be beggary, after twenty-five years of compulsory and unpaid-for service, are the labourers and care-takers employed in this expensive work.

I thought our artist, having a taste for elegant disorder, rather exaggerated the reputed neatness of these grounds, and almost fabulous exactitude of their keepers. But it is true that the walks, trees, and water are just as much the objects of care as the rooms and furniture of the most precise Dutch house can be. No leaf dare rest on the ground, if it has the audacity to alight there; a withering flower must not shed its petals over its mother-earth; the poet dare not say to the last rose of summer in the garden of the tsar:

Thus kindly I'll scatter thy leaves o'er the bed
Where thy mates of the garden lie scentless and dead.

Such an act would not be justified by any poetic licence at Tzarsko-Selo.

When we consider that the walks which are thus kept without speck or spot appearing, cleaned, brushed, it might be said dusted, from morning to night, would occupy a length of about 150 versets if united in one, it will give us some notion of Russian order and discipline. There is a staff of, I believe, 600 men employed in this work. The grounds are most agreeably diversified, and open pretty views from time to time; lying among the Duderhof Hills, they have the advantage, rare in Russia, of an elevated site. The edifices in them are fantastic; but where all is, or must be, artificial, a fantastic aspect is desirable. The interior of the palace is one scene of eastern splendour and singular variety. The amber chamber is the most famous: the vast quantity of amber with which the walls are covered was presented by Frederick the Great of Prussia to Catherine II.

We entered the Hermitage, which was re-edifying, the walls being gilded and painted elaborately; it is meant as a sort of family retreat with the privileged guests of the imperial court, like the long celebrated one of Catherine II. at St Petersburg: here also is the apparatus for placing and removing the royal meals without the appearance of servants, in the manner which so much delighted Peter I., but which is now used in large public institutions in his country.

The grounds are adorned with Chinese and other buildings, and a lake, on which are pleasure-boats for the amusement and nautical edification of the little dukes. There is also a model-farm at the extremity of the grounds, but we did not reach it. Our maiden guide had been trying to make me comprehend a long speech, and the fact that I did not understand her becoming at last indisputable, she proceeded to a mode of explanation equally incomprehensible. She picked up a small piece of stone, and shewed it to me, pointing at the same time in an opposite direction to that in which we were going. I imagined that the pebble, in her opinion, possessed some efficacy, and I took care to let her see that I put it safely into my pocket; whereupon she laughed, and said: 'No, no!' and taking

up another, touched it with her finger, and pointed in the same direction, throwing it away. We turned, and walked in that direction, and came to the stone fountain—a poetic one. It is called the Fountain of the Broken Pitcher, and is a poem in itself. There is the young girl mourning over her pitcher, which lies broken at her foot, with the water of the fountain pouring through its broken-off neck. It is fortunately not of plaster, and therefore this figure is one of the few things of the kind which do not look miserably dilapidated in this climate.

It was to shew me that there was a stone fountain to be seen, our guide had so symbolised her meaning. The water is an exquisite treat after the horrors of the Neva; and I remember some traveller having related that, in his time, the young daughters of Nicholas I. used to come here in the early morning, attended by a domestic carrying a glass, in order to drink from this fountain a draught perhaps as beneficial as those mineral ones which other lands produce.

It may be that these then young princesses have since thought of the young girl weeping at the stone Fountain of the Broken Pitcher. To how many, whose young hopes would have drawn long and deeply from this earth's fount, has the pitcher appeared to be broken precisely when it was filled!

A STRANGE FAMILY.

O mickle is the powerful grace that lies
In herbs, plants, stones, and their true qualities;
For nought so vile that on the earth doth live,
But to the earth some special good doth give;
Nor aught so good but strained from that fair use
Revolts from true birth, stumbling on abuse:
Virtue itself turns vice, being misapplied,
And vice sometime's by action dignified.
Within the infant rind of this weak flower
Poison hath residence and medicine power;
For this, being smelt, with that part cheers each part,
Being tasted slays all senses with the heart.

Romeo and Juliet.

THERE was once a time when every one who paid attention to the forms of vegetable life which cover hill and dale with such profusion, acted solely under the belief that each plant contained a remedy for some particular disease. Although we can now afford to smile at the strange properties which these old herbalists consequently attributed to plants entirely undeserving of the honour: although we do not believe with Gerard that 'when the weasel is to fight with the serpent, she armeth herself by eating rue against his might,' or that 'rosemary giveth speech unto them that are possessed of the dumb palsy;' yet it is not the less true that there are groups of plants distinguished by powers as wonderful as the fables of the twilight of scientific knowledge. Some of these remind us of the awful phenomenon occasionally revealed to us in history, of a family pre-eminent in crime and cruelty, whose career is one dark story of lust and murder, and whose name survives in the hatred and abhorrence of posterity. Others, again, the friends and benefactors of mankind, have satisfied the hunger or quenched the thirst of grateful nations through all time. It is, however, to a family that comes under both these classes—one that at the same time is prolific in poisons, and supplies part of the daily food of millions—that we would at present direct the attention of those who feel an interest in the wonders of creation. And we doubt whether any division of the vegetable world could be selected which would be found more replete with interest.

Science has given to a well-defined class the name of *Solanaceæ*, or nightshade-worts, from the solanum or nightshade, one of its members; and it states, as a general characteristic, the energy of the narcotic principle residing in the juices of the roots, leaves, and fruits, though of course subject to modifications in each species. The only representatives of the *Solanaceæ* native to England, are poisonous in a fatal degree; but as they present no peculiarities in the mode of operation, it will be sufficient simply to name them as useful to the student in giving him an idea of the characteristics of the whole order. We find in our hedges and woods two nightshades (*Solanum*), one with purple, and the other with white flowers—the deadly nightshade or dwale (*Atropa Belladonna*), with dark purple bell-shaped flowers and shining black berries; and the henbane (*Hyoscamus niger*), with large blossoms of a dusky yellow, exquisitely pencilled with purple lines.

The first plant, however, over which we would wish to linger is one of the *atropas*, which has been rendered celebrated by the strange superstitions of which it has been the object. We allude to the mandrake (*Atropa mandragora*). This flower is indigenous on the shores of the Mediterranean; it presents to our view a tuft of dark shining leaves a foot long, and a flower of a dull white, veined delicately with violet, succeeded by a round ruddy fruit of a pleasant odour. But the remarkable part of the mandrake lies under ground. The root, which is often four or five feet long, is of a reddish colour, and, as it usually divides half-way down into two or three branches, sometimes assumes a singular likeness to the human body. The fruit of the plant was supposed to be useful in cases of barrenness. Allusion is made to this in the story of Jacob; and the same idea still prevails in Greece. In the middle ages, this vegetable mimicry of the human form gave rise to singular superstitions, no doubt increased by the highly coloured narratives of pilgrims and crusaders. By these accounts, a kind of animal life is attributed to the mandrake; shrieks of pain were elicited from it by violence; madness fell upon any who heard those weird cries; and certain death awaited the man bold enough to pull it by the roots. It was also pretended by the quacks who sold the roots, that they were charms against all mischief; and to enhance their value, they declared that they grew only under gibbets from the flesh of the criminals which fell thence to the ground. Shakspeare has availed himself with his wonted skill of some of these wild fancies:

And shrieks, like mandrakes torn out of the earth,
That living mortals, hearing them, run mad.

And again:

Would curses kill, as doth the mandrake's groan,
I would invent as bitter-searching terms,
As curst, as harsh, as horrible to bear.

It is but justice, however, to the Elizabethan age to state, that Dr Turner wrote at some length to expose these errors, and stated that he had himself dug up roots without receiving harm or hearing any noises. Modern science recognises the mandrake as a dangerously narcotic plant; which is, however, useful as an anodyne, when administered with care by an experienced hand. The fruit is said to be exhilarating, and to be a favourite food of the Arabs.

When we consider the next plant to which we shall devote any space, we shall be struck by the wonderful provisions of an all-wise Creator for the sustenance of those dependent upon his bounty. Whoever looks cursorily at the potato (*Solanum tuberosum*),

and remarks its dark leaves, its dull lurid flowers, and its fetid smell, recalling to his mind the wild nightshade of our hedges, would at once pronounce that the herb was dangerous, and certainly unfit for food. His judgment would not deceive him, as the plant is really highly poisonous; and it is only under a modified form that a portion of it becomes so valuable as food as almost to rival the produce of the cereals. It is very generally supposed that the tuber, which we eat, is a deposit of fecula or nourishing matter in the fibres of the root; this, however, is a mistake, as it really is an underground branch in a changed and swollen state. We shall be convinced of this when we consider that the so-called eyes of the potato are true buds, which, upon the tuber being buried in the earth, in favourable conditions of warmth and moisture, are developed into branches; and this, indeed, is the familiar way in which the gardener propagates the plant. This very useful vegetable came originally from America, but it is uncertain from what part. It has been found growing wild on the mountains of Chili, and recently on the peaks of Mexico; but it was from Virginia that Sir Walter Raleigh introduced it into England. Its range of cultivation is very great, extending from Iceland to the tropics; it must be remembered, however, that in the latter regions it requires height of position, and flourishes only when about 10,000 feet above the level of the sea.

Nor is the potato the only member of this class that appears upon our table; although we can only name a few condiments and esculents of less importance. Such are the capsicum, which furnishes a piquant fruit familiar to us in the form of Cayenne-pepper; the tomato or love-apple (*Lycopersicon esculentum*), associated for ever with the imperishable memory of Mr Pickwick and the great marriage case; the egg-apple (*Solanum melongena*), the long purple fruit of which is daily seen in the markets of Paris, and forms a favourite dish of the Anglo-Indian.

Very different, however, from these tempting aids to the palate is the fruit of the apples of Sodom (*Solanum Sodomæum*), so famous for their fair outward show and their rotten core. This favourite of the poets grows abundantly on the desert shores of the Red Sea; it has rough, divided leaves, handsome purple flowers, and a smooth golden shining fruit, the flesh of which is at first firm and of a bitter taste, but afterwards decays into the dry, ash-like substance, which disappoints the expectant traveller.

We shall notice only one more member of this interesting family, the history of which furnishes us with one of the most extraordinary instances of the imitative faculty in man ever exhibited. Without entering into the vexed question of the effects of tobacco (*Nicotiana tabacum*) upon the habits and manners of an age, we may observe, that its adoption as an indulgence was in direct violation of the usual law of progress. The habit of smoking its leaves, instead of having first prevailed among civilised nations, and so extended to the more barbarous, has, on the contrary, been borrowed from the actual savage, and from thence ascended to the most exalted ranks of the most refined society. Great doubt rests upon its native country; but it is certain that the Americans first applied it in the way so well known now: they themselves called the plant *petun* and *yati*, but Europeans have adopted the name from their clay-pipes (*to-bacco*). It is a popular superstition that Sir W. Raleigh first introduced it into England; but Camden gives the palm of priority to a Mr Ralph Lane, while others contend for the claims of Sir F. Drake. It is well known what opposition it met with at the hands of governments, and how, nevertheless, in an incredibly short time it spread over the whole world.

This is but a glance at a truly strange vegetable

family; but to many of our readers it may be a suggestive one, and to many more it will recall the quaint but fine verses of Cowley:

If we could open and inbend our eye,
We all, like Moses, should espy,
E'en in a bush, the radiant Deity.

POPULAR PUPPETS.

THE mention of popular puppets will no doubt conjure up in all minds the image of a certain hook-nosed and crook-backed gentleman, who beats his wife, and kills his children, and everybody else who comes in his way, for the amusement of our street-population, and whose misdeeds are laughed at, not reprobated, probably because in the end he makes away with the very spirit of evil himself. But though friend Punch has ever played a prominent part among popular puppets, and has, indeed, in our country become nearly the sole representative of the race, it is not our intention to treat of any individual puppet, however great a favourite, but of the fortunes of the tribe in general.

Although, in a previous article on the subject of puppets, we have maintained that the history of these wooden actors presents three phases—the hieratic, the aristocratic, and the popular—it must not be supposed that these have been regularly successive: on the contrary, the various phases have imperceptibly melted into each other, and most probably in modern Europe the popular character of puppets was never at any period entirely absorbed in the ecclesiastical; and the fairs, and villages, and public streets of the middle ages have had their humble and profane puppet-shows descended in direct line from those of the ancients, and entirely distinct from the ecclesiastical exhibitions mentioned in our previous article. However, eschewing all deep antiquarian research on the subject, we shall rest contented with taking up their history at a later period, when mysteries and miracle-plays, as a general rule expelled from the churches, were taken up by various brotherhoods; and the *motion-man*, with his theatre on his back, and his wooden actors in a bag, traversed the country from one end to the other, representing in every parish, at all seasons, and at a very small cost, the subjects performed by the living actors, at stated seasons, and in large cities only; and also reproducing in miniature the pageants and May-games which at certain periods of the year formed the delight of the people.

Through these latter—in which the heroes of the popular ballads always played a conspicuous part—Robin Hood, Maid Marion, Little John, and all the personages belonging to that cycle, were introduced on the puppet-stage in England; as also the giants Gog and Magog, and the hobbyhorses, which, in spite of the people's affection for them, were suppressed towards the middle of the reign of Elizabeth as 'damnable relics of paganism;' and the Moorish, or *Morric-dancers*, as the popular pronunciation would have it, who from the earliest times performed in the pageants, and who took so firm a hold on the popular taste, that Hawkins tells us, in his history of music, that but very shortly previous to the period at which he was writing, a Moor, dancing a saraband, was an obligatory personage in every puppet-show. It was probably out of deference for this taste that Punch and Judy danced a saraband in the ark, in the puppet-show of the Creation, followed by the Deluge, mentioned in

the *Tailler*, as having been considered very instructive for young people; for puppets have never been afraid of anachronisms, and ever since his appearance in the country, Mr Punch has indeed mixed himself up with every event of antediluvian as well as postdiluvian history, thus shewing his own belief in the very ancient origin ascribed to him by the learned.

When, in the middle of the fifteenth century, the acting brotherhoods began to intermix their miracle-plays, which were the precursors of the historic drama, with moralities, which may in like manner be said to have been the forerunners of modern comedy, the puppet-players at once adopted the innovation—no difficult matter for them, who, with the conjuring powers of a knife and a piece of stick, could at any given moment swell the number of their troop to any amount required; and thus Perverse Doctrine, Pride, Gluttony, Vanity, Humility, and Piety, and all the other vices and virtues, which were personified and played their parts in the moralities, had their antetypes in the puppet-shows—public opinion singling out, in anticipation of friend Punch, the Old Vice, or Old Iniquity, a standing character in the moralities, as its prime favourite. Again, when about a century later, the great revolution in dramatic literature took place, which substituted for the moralities, masks and interludes, until then in fashion, tragedy and comedy under their modern form, the repertory of the motions, as puppet-shows were then still called, underwent the changes of the day, without, however, entirely abandoning their ancient favourites. In the new *genre*, also, the wooden actors seem to have approved themselves no mean rivals of the living ones; for various writings of this and subsequent periods contain bitter complaints against the puppet-players, for poaching in the preserves of the legitimate drama, even the stately muse of tragedy being made to stalk their mimic stage.

But let it not be supposed that at this period puppets were still exclusively houseless vagrants, strolling from village to village, and from fair to fair, without a local habitation of their own, and giving their performances in the open air. Far from it. They were now installed in permanent theatres, not only in the most populous localities of the city of London, but in many provincial towns. The puppet-theatres of Holborn Bridge and Fleet Street were in high repute during the sixteenth and seventeenth centuries; and those of Eltham and Brentford were so renowned, that they drew crowds of visitors even from the capital; while on the other side, grave provincials came up to London, more especially to visit the puppet-shows. These last were indeed so generally accounted one of the most agreeable recreations of the gentry, that Phantaste, in Ben Jonson's comedy of *Cynthia's Revels*, mentions them as among the greatest pleasures a woman in any condition of life could desire to enjoy. Even as late as 1712, Arbuthnot includes the love of puppet-shows among the characteristic traits of the Londoners; and a writer in No. 377 of the *Spectator* bears similar testimony to the prevalent taste, when, in making a list of places where people are likely to come by a violent death, and enumerating the accidents that have occurred there, he mentions 'Lysander smothered to death at a puppet-show.'

The puppet-shows referred to in this latter case, were no doubt those of a certain Mr Powell, who, having attained a great reputation at Bath, had removed to London, and established a theatre in Covent Garden, where Punch and Judy, in company with Dr Faustus, according to the *Tailler*, threw into the shade the new Italian opera in the Haymarket, and drew away the most fashionable part of its audience—Mr Punch in particular proving, in the eyes of the fair sex, a most dangerous rival to the Italian singer Nicolini. Alas! poor Punch! how is he fallen from

his high estate! What fashionable belle ever casts a glance at him now, when his shrill tones announce his presence at the corner of some street, where his audience is generally composed of ragged urchins and idle nurse-maids, though now and then a witty statesman or a humorous man of letters may stop and enjoy a laugh against all the rules of conventionality!

The exact date of Punch's arrival in England is probably difficult to ascertain, as the learned differ on the subject, some saying that he came in with William of Orange by way of the Hague, others maintaining that he arrived here long before, direct from Italy. At all events, Italian puppets were already known in England under Henry VII.; and Chalmers, in his account of the early English stage, quotes a letter from the privy council of 14th July 1578, addressed to the lord mayor of London, authorising him to allow some Italians to exhibit their 'strange motions' in the city. In the beginning of the seventeenth century, French puppets also were established in London. Indeed, there seems in those days to have been as great an interchange among nations of these wooden artists, as there is in the present day of their living prototypes; for English puppets visited France, and Germany was at one time not only inundated with English, French, Italian, and even Dutch and Spanish actors, but the foreign puppets followed in the wake of these, to the great detriment of the wooden performers of indigenous growth, of which there had always been a goodly supply. Italy, the native land, it may be said, of modern puppetry, must, indeed, at a very early period have sent her puppet-players abroad, for at the commencement of the seventeenth century, already, all the *titereros*—as they are there called—of Spain were Italians, and so likewise were the *bonifratres*, as the itinerant puppet-show men of Portugal are called; retaining in this name a smack of their ecclesiastical origin, which is further evinced in the monkish dress they almost invariably use there as well as in Spain. Italian exhibitors of puppets have even been met with in Siberia and among the Cossacks of the Don. So great, however, has ever been the affinity between the spirit of puppets and that of the nations among whom they have taken up their abode, that the foreign nationality of their exhibitors has never prevented puppet-shows from being thoroughly national wherever they have appeared. Thus, we find that at the period we have alluded to in Spain, as well as subsequently, when all Spanish cities also had their regularly established puppet-theatres, the subjects represented were not Italian, but thoroughly Spanish, and Pulcinella, though naturalised under the name and title of Don Cristoval Pulichinella, was thrown completely into the shade by the personages borrowed from the popular ballads of Spain, such as Moorish and Christian knights, giants and sorcerers, hermits and saints, the conquerors of Mexico and Peru, and the truly national bull-fights. Even when treating classical subjects, it seems that Spanish puppets know how to infuse into them the national spirit. A French traveller in Spain in 1808, tells of having been present at Valencia at a puppet representation of the death of Seneca, who having been a native of Cordova, had a right to appear on so national a theatre. In the puppet-show, as in history, the famous philosopher was represented as being put to death by order of Nero, by having the veins of his arms opened while in a warm bath. The streams of blood which were made to flow from his arms by means of red ribbons, are said to have given universal satisfaction; but what most delighted the pious subjects of his most Catholic majesty, was to see the heathen philosopher carried up to heaven in the midst of fireworks, and to hear him pronounce there a recantation of his pagan errors, and a declaration of Christian faith in the orthodox form.

In like manner, in Germany puppets adapted themselves to the metaphysical and cosmopolitan tendencies of the national mind. But the place held by puppets in the theatrical history of Germany has been so peculiar and so important, that it merits more than the passing notice we should here be able to give it; and therefore we shall pass at once from Germany to France. Need we say that France, the home of light-hearted gaiety, wit, and parody, excelled at all times in puppet-shows; for the progress made in this, as in all other arts, is in proportion to the encouragement given, and the appreciation met with. Towards the close of the sixteenth century, Paris had already its permanently established puppet-theatres; and in 1649, Polichinelle—who, by the by, a French authority declares, is not an offshoot of the Italian race of that name, but a native of the country, in fact, nothing less than a modified type of the popular Bérnaïsa, the galliard Henri IV.—in 1649, we say, Polichinelle had already attained to a degree of popularity that caused his name to be adopted by writers of political pasquinades against Cardinal Mazarin, and authorised them to place in his mouth such a vaunt as this: 'I may maintain, without vanity, Messire Jules, that I have always been more welcome to the people, and in higher consideration with them, than you; for how often have I not with my own ears heard them say: "Let us go and see Polichinelle;" but who has ever heard any of the people say: "Let us go and see Mazarin!"'

Brioché, the famous tooth-extractor and puppet-showman, mentioned in a previous article, and master of this very popular Polichinelle, is the first exhibitor of puppets in France whose name has been handed down to posterity. No doubt he was worthy of this distinction, for it seems that it was the witty sayings prompted by him that gained for his wooden dependant such great popularity. The public favour was, however, for a long time divided between Brioché's monkey Fagotin and Polichinelle; but Fagotin ultimately fell in a duel with a certain M. Cyrano de Bergerac, who mistook the disguised monkey for a lackey making a face at him, and against whom Fagotin valiantly drew his sword when attacked—a fact that made him even more renowned in death than he had been in life. No doubt, Fagotin had many successors; for up to late in the eighteenth century a monkey was as necessary an appendage to a puppet-show as a dog is in the present day; but with the exception of one, belonging to a certain Nicolet, and which has been celebrated in verse by M. de Bouffier, we know of none that has rivalled the fame of Brioché's Fagotin. After Brioché's death, the direction of his puppet-theatre devolved upon his son, who maintained its high reputation in spite of the numerous competitors which arose in course of time; and among which, not the least formidable was the so-called Theatre of the Pigmies, opened in the Marais du Temple in 1676. These pigmies—who from the puppet point of view ought rather to have been called broddignags—were, according to the programme of their director, La Grille, 'what has never been seen before: human figures, four feet high, richly dressed, in very great numbers, who perform on a vast theatre pieces in five acts, interspersed with music, ballets, flying-machines, and changes of scenery, and who declaim, walk, and gesticulate like living persons, without being held suspended.' But though La Grille took good care not to call his performances operas, the fact of their being so could not be concealed; and however much he might appeal to the wooden qualities of his actors, they were nevertheless legally adjudged to have trespassed on the privileges of the regular opera, and sentenced to cease their warblings.

The greatest triumphs achieved by Parisian puppets were won between the years 1701 and 1793, during

great part of which period they furnished parodies of all the productions of the French Opera, the Italian Theatre, the Théâtre Français, and the Opéra Comique, very often giving evidence in these of great literary acumen, and delicate yet telling irony; while they carried on a constant war with the *entrepreneurs* of those establishments, who, jealous of their success, sought to place all kinds of difficulties in their way. The repertory of the puppet-theatres was not, however, limited even to the wide field of parody which the regular theatres opened to them: they drew within their witty sphere every event, political or social, that occupied the public for the time being, and counted among their literary contributors Le Sage and other distinguished wits and literati of the day. But though allowed a liberty of speech far beyond any tolerated in living actors, puppets in France seem at last to have been placed under the same censorship that weighed upon the legitimate drama; and to this may perhaps be attributed the degeneracy which began to manifest itself in the puppet-shows at the commencement of the last half of the eighteenth century, when wit, parody, and satire were superseded by mere mechanical surprises and *pièces à grand spectacle*. The taste of the public seems, however, to have kept pace with this degeneracy; for the number of puppet-theatres in Paris went on augmenting up to the close of the century, and in 1793, large puppets, under the name of Pantagions, and which were also exhibited in London, again made their appearance. Among the transformations for which these puppets were more especially famous, we have seen one mentioned in which the different limbs of a barrister were gradually detached, and transformed into so many clients—a trick which we have no doubt would be frequently repeated off the stage, were not the secret lost. These same Pantagions performed in the Théâtre de la République a grand pantomime, entitled *Les Métamorphoses de Marlborough*. What these were, we do not know, but they may have been ugly enough.

Puppets outlived the storms of the Revolution in France, but not without bearing their share in its vicissitudes; for we learn from one of Camille Desmoulins' papers in *Le Vieux Cordelier*, that Polichinelle was guillotined during the Reign of Terror—a fact that makes us fear that he had been giving himself aristocratic airs. Indeed, how can it be wondered at that he should, when we consider the high patronage which he and his fellows had enjoyed for centuries in France. In the present day, however, the puppets of France are reduced, like their compeers in England, to seek the suffrages of the sovereign people; and we are bound to state, that the great development attained by puppet-theatricals in England, Germany, and France at various periods, was in a great measure owing to the persecution, and, in the case of England, the actual interdict under which the regular drama and its votaries laboured at these periods; and that as soon as the latter were relieved from the heavy burdens and strong prejudices that militated against them, puppets sank into comparative insignificance.

In Italy, however, whether owing to its being the indigenous soil of modern puppets, or to the fact that an arbitrary censorship still weighs upon the regular theatres there, puppets are to this day in as flourishing a condition as they ever were at former periods in France, England, or Germany. Not a city but has one or more puppet-theatres, visited by all classes of society, and where you are not only enlivened by the wit and humour which have fled from the more regular establishments, but where the lovers of opera and ballet may feast their ears upon the master-works of Rossini, Bellini, and Verdi, and their eyes upon wooden Englishes and Rosinis, whose pirouettes and *entrechats* surpass anything ever accomplished by human legs; and who, when bouquets are showered upon them, put

their little hands upon their hearts, and bow themselves out as gracefully as any of their flesh-and-blood rivals.

TALK UNDER THE STUARTS.

MONSIEUR GABRIEL DUGRES, of Saumur, 'teacher of the French tongue in the most illustrious and most famous university of Oxford,' published, in the year 1639, a hand-book of travel-talk for the benefit of Mr Hyde, Mr Hampden, or any other gentleman who might meditate performing the 'grande tour.' It consists of a series of dialogues, written not without a certain quaint humour, and containing much information as to the manners and customs of the day. It is on this account we select portions of the talk that have no special reference to the grand tour. The title of the book is *Dialogi Gallico-Anglico-Latini*, and it is dedicated to the Prince of Wales. A few years afterwards, it may have formed the pocket-companion of that 'sacred twig of the most holy tree that has ever flourished in this happy isle,' as he is styled by the author, who little foresaw how useful a knowledge of the French tongue would prove to the 'sacred twig,' and how well acquainted it was destined to become with the happy isle's hereditary foe.

In the first dialogue, we are introduced to 'a scholler, his land lord, and a teacher of the French tongue.'

The scholar commences: 'I desire much—I am very desirous. I have a great minde to lerne to speake French, English, Spanish, Italian, High-Dutch, Greek, Hebrew.' Not that he is likely to be such a *héllo lingua*, but the opportunity is a good one for teaching names.

The landlord informs the teacher that 'an outlandish gentleman' wishes to see him. The professor visits the 'scholler,' and they come to terms at once.

Scholar. What doe you take a moneth?

Master. Ten shillings a moneth.

'How many times a weeke will you teach me?'

'Once a day.'

'How long will you tarry with me?'

'An houre at a time.'

'What time of the day will you come? I would gladly bestow the morning upon my more serious studies.'

'I will come, then, after supper.'

'I thinke that time somewhat unseasonable,' &c.

Certainly any scholar of the present day would say so, but our meal-times have altered as much as tutors' charges.

The sixth dialogue is headed: 'Complements betweene him that inviteth and him that is invited before they sit at the table. The entertaining of one at table, and the complements they doe use in it.'

The 'complements' consist in refusing to take the place of honour till the host exclaims: 'Sir, the dinner is spoyled, the meat grows cold; sit downe, I pray you, for we doe the company wrong.' Then come depreciations of the dinner on the part of the giver, and the opposite on the part of the receiver; and we next observe that Englishmen were in the habit of asking for a cushion to sit upon, as appears by the exclamation of the host: 'I doe wonder very much that you English gentlemen can not sit without a cushion, and, nevertheless, run poste upon saddles as hard as iron.' The 'English gentleman' explains, that on horseback they are taking exercise, but on the chair they are sitting still, and so are afraid of catching cold. In the *Hand-book of Travel-talk* for 1856, there is no mention made of chair-cushions. Englishmen have grown hardy, and learned to dispense with such effeminacies.

Here is something curious about knives:

'Have you no knife?'

'I have forgot mine at home.'

'I doe renounce unto that gentility, for one looses many good bits for want of a knife.'

'Sweet heart, friend, can you lend me a knife? I will give it you back againe when I have done with it.'

'Here is one at your service, but it does not cut very well, and it is not very cleane.'

'It is good enough, I thank you.'

The conversation then turns upon carving.

'I am a poore carver.'

'It is your modestie that makes you say so: we know you Frenchmen excell in that art. . . . In England, we leave that to women, if they be in the company; for as they sit in the upper end, so doe we give them the honour to let them take the paines to cut, and serve the meates; which is the cause that it is a rare thing to finde men which can cut and carve foule.'

'That is very true in families, but you have no women in your colleges, which keep you from learning to carve.'

'There needs no great cunning to carve a penie part, or a penie-halfe-penie part. As for Plato his men, they are as seldome seen there as the eclipse of the moone.'

The carving commences, and calls forth the following remarks:

'Fie, fie, you must not tare the meat so with your hands, and touch it with your fingers. Take that little fork, and touch nothing at all with your fingers, or at least touch but the bit which you will eat, for you might offend and distast the others in handling the meat so slovingly.'

'It is not good to use so much ceremonie among schollers.'

'I doe confesse it: but it is good to use himselfe betimes to be polite, to handsomenesse and neatnesse.'

Next comes a specimen of the conversation of the day:

'I can not take my meales as a dumb beast, which does nothing but chew and swallow downe without saying a single word.'

'Would you have the beasts to speak?'

'It is good for a Carthusian, or for an hermite that is shut up to say nothing when he dines. I would have my tongue to ply as well as my teeth.'

'Does it not work well enough when it tasteth the meates?'

'I do not meane it so. This hare is drier than a stone. I think that this goose is one of those which did awake the watch of the Capitolum, when as our Gauls went neare to take it; for it is harder than wood. Peradventure it is that which was in the arke of Noah.'

The tide of learning is stopped by a last lesson in good-manners:

'Dip the crust in the sauce, the gravie.'

'You have a good cook; but he has not spared for pepper; for it is so extreemly peppered that it burns my tongue.'

After eating follows drinking. 'Manner of drinking one to another: the sorts of wine. . . . Talkes ordinarily used in drinking, and in taverns,' &c.

'Come on; fill me some wine quickly. . . . This glasse is not cleane. . . . Rub it with water and salt, that it may be cleare and cleane. . . . Oh, sir! what doe you doe? You have not drunke all. You must empty the glasse. Turne it adowne, that I may see if there be anything left. . . . So they drinke in the palatinat, that there is not a drop left with which a fly might quench its thirst.'

'To whom have you drunke?'

'I have drunke to that gentleman.'

'Who has seene you drunke? You must drinke one againe.'

'The French freedome is to be condemned in this, for it giveth every one leave to drinke as he thinketh good, at his discretion.'

'To whom shall we drinke now?'

'Let us drinke to this gentleman, his mistresse health.'

'Let us rather drinke to yours, for mine does not deserve that one should drink to her.'

'Why? Are you out of her favour?'

'No; but it is for some other reason.'

'You will not confesse. Come on, sir, to her that possesseth this gentleman's heart. To that faire Angel of Love, and that miracle of Beauty. To the most eminent over all those that are of the female kind.'

'Sir, you give her titles undeserved by her.'

'On the contrary, they are far below her merit: the admiration whereof must teach me some new language, to praise it according to its worth; or else, I must be content to reverence it with an humble silence, having no language able to expresse it.' And so forth.

Next comes some information about wines:

'Will you drinke a cuppe of sack. Vous plait il de boire un coup de vin d'Espagne; in the Latin, poculum vini Hispanici. . . . It tasteth wonderous well. It is a cup of dainty wine. We drinke none so good in tavernes.'

'It is because they spoyle it. They doe sophisticate it, and mingle it in tavernes. Goe, and draw a pinte of Muscaden.'

'Halfe a pinte will be enough; or a quartern of a pinte.'

'What say you? We must drinke, carrousee, like Templars, like sponges. . . . I am almost drunke. I thinke that you will foxe; I begin to see double.'

'It is because that glasse is made of the metall of which are made the spectacles that multiply every-thing.'

'You must need lead me home by the armes, as a young bride.' So ends the dinner.

'Shall we rise from the table?'

'We must drink the cup of charity, as they say.'

'Sir, you forget to put up your knife. If it please you, I will teach you a way that you shall never faile to put it up. You must alwaies drink a cup after you have put it up, and so you shall never forget to put it up.'

'Sir, please you to take a pipe of tobacco?'

'Fie, what doe you speak to me of? I wonder much that you will take that stinking smoak, that poisoned weed.'

'Ah, sir, you are much deceived. . . . It is the most soveraigne and physical herb in the world.'

Having acquired the French tongue, the scholar sets out on his travels. Crossing the Channel was a service of danger then.

'The whirle-winds, tempests, and stormes are very dangerous. The pyrates and robbers upon the sea are no lesse dangerous,' he is told. Nothing daunted, he proceeds to strike a bargain with a skipper.

'What shall I give you to carry me over into France?'

'Halfe a pistoll—10s.'

'It is too much; I will give you foure francs—8s.'

'Sir, I will not carrie you over under a hundred sols, or five francs, an angell, or 10s.'

'Well, then, I will give you what you aske me.'

'Provide yourself with victuals before you goe upon the sea.'

'The going over is not long, as I believe?'

'It is but of halfe a day, if you goe from Dover to Calais; or of one day and of a night if you goe to take land, to aboard at Deepes.'

The ship saile and becomes becalmed. 'The sea is very calm; still wee doe not goe forward. We should need to have some rowers; but we have no oares, and we know not how to row.'

'I feare, lest after this calmenesse of the sea, wee have some sea storme, which may cast us upon some rock, or upon some sandie banck, and so our shippe may suffer shipwrack.'

After a while we find the travellers approaching the land, where they are carried ashore on the backs of the boatmen.

'Why do you not carry us to land in your boat?'

'It is not the custome.'

'I see well that this is a plot to get money. What must you have?'

'A card *ecu* a man.'

'Half is enough, or five sous.'

Arriving at the hotel, they are greeted with, 'Gentlemen, will you be pleased to come this way?'

Excuse me if I goe afore you; it is to shew you the way; on which the traveller makes a memorandum in his pocket-book: 'Servants are very courteous in this country.' He changes his money, and receives information as to the value of French coins. 'There is a denier, which is not worth halfe of one of your farthings; a double, which is worth two deniers; a liard, which is worth a double, and a denier. There be now but few liards in one pece. A Carolus is worth 10 deniers; a sol, 12 deniers; 5 French sols make even 6 English pence. . . . A golden crowne is worth ten shillings; we call them also crownes at the Sunne. A pistole is worth 20 shillings, &c. I thinke that this pistole is not good: where is the touchstone? Rubbe it a little upon your hayre, or upon your shooes, and if it be red, it is a signe that it is naughty.' The tourist visits Rouen, and is astonished at the condition of French horses. 'Good Lord, how leane they be! You starve them. There is neither hay in the rack, nor oats in the manger. They will not be able to carry us three steps of the way.' Experience confirms his opinion. 'My armes are bruised, lamed, with the very beating of my horse. Hee will not goe neither fir rod nor spur.' Fatigue sends him early to bed.

'Heare you, is there nobody but I that lieth in this chamber?'

'There is a very honest gentleman that is to lie in it.'

'Does you know him very well?'

'Not very well.'

'How doe you know, then, that he is an honest man?'

'He looketh like one.'

'Treat him to come to bed quickly,' &c. 'I have not slept well to-night. The fleas have tormented me so extremely, that I could by no means sleep.'

From Rouen he goes to Paris. 'I doo intend to stay two or three weeks in Paris, to see the town, and the kings court; then I will goe to Orleans, for it is better and cheaper living there. From Orleans I will goe down by water in a boote as far as Saumur. And by the way, I will goe to the castles and the townes of Blois, Amboise, Tours.'

At Saumur he takes up his quarters, and is charged 'ten French crownes a moneth, three pound for diet, chamber, and washing.' He expostulates: 'It is much—it is fifteen shillings a week. We are very well in Oxford for nine or tenne shillings a weeke.'

'That may be true: but you must consider that we pay here a great deale more taxations than they doe in England. Moreover, you drinke alwaies wine here at your meales, whereas in Englande they give you but beere.'

During his stay at Saumur, the tourist probably perfects himself in the language, for we hear no more of his travels. He learns all that is necessary for a gentleman to know. We find him at one time acquiring the art 'of dancing the cinque paze; of making a leg after the fashion to dance with the musick; and learning the reproof of his dancing-master: 'Stand upright with your body, and when you dance, stretch not so your breeches out.' At one time he is fencing, or having his beard cut 'with a pick-devant, shave all the hairs to the skin, and leave but a little epiggle, &c. This is as well as can be. My beard is cut well enough, but only here is a haire that goes over the other.'

At length he departs. And it were well if every English traveller of the present day deserved to be thus apostrophised by his host: 'Sir, I thanke you most humbly. Truly we have reason to remember you in your absence, for you have carried yourself so honestly towards us, that we should be injurious to your name if we should not honour it with a perpetuall remembrance.'

COPYING BY LIGHT.

WE have to propose to our readers, especially our fair ones, a scientific amusement of an elegant and inexpensive kind. We would teach them to make copies of pictures, engravings, maps, music, &c., by means of light, and according to a process which costs hardly anything beyond the price of the paper.

1. Having fixed upon the object to be copied, take a sheet of good paper, and spread a solution upon one side of it composed of 60 grains of blue-stone or sulphate of copper, 80 grains of bichromate of potass, and 8 ounces of water. This composition should be spread upon the paper by means of a glass rod; or if you do not happen to have such a thing, any smooth phial will do as well.

Paper prepared with this solution is of a beautiful yellow colour; when dry, it is fit for use, and should be used as soon as convenient, for when kept long, it loses its sensibility. Place the prepared side of this paper against or upon the face of the picture to be copied, and allow the back of the picture to be exposed to the light; and in the course of a quarter of an hour, if it is a bright sunny day, you shall see—what you shall see. If the weather is dark and cloudy, you will have longer to wait, perhaps not less than half an hour; but having allowed it to remain exposed to the light for this time, if you take it into a room partly darkened, or with the blind drawn down, a very clear *negative yellow* picture will appear on the prepared paper. You must now pour a few drops of nitrate of silver solution on it, of the strength of half a dram to two ounces of water, and spread this quickly over by means of your phial or glass rod, and instantaneously a very beautiful and vivid red picture will make its appearance.

The back of the picture, however, having been exposed to the light, while the face was pressed against the prepared side of the paper, the objects copied will be formed in a contrary direction to that in the original, so that the part of the original picture situated at its right side will appear on the left side of the copy, and *vice versé*. This might be no great matter, as regards some pictures, but it is obvious that by such a process neither maps nor music could be copied. When necessary, however, as in the case of maps and music, the original may be exposed to the light, and the prepared paper pressed to the back, which would give the true position. But it is always desirable, when the subject admits of it, and more especially in the case of a thick engraving or picture, for its *face* to be pressed against the prepared paper, as in that case the copy is produced much sharper and more distinct than the other way.

To keep the picture well pressed against the prepared paper, a heavy piece of glass may be placed on the top, as the rays of light will not be at all lessened in their intensity by this arrangement.

These photographic pictures may be fixed by washing well in pure water, and when dry, a gloss may be given by spreading a little gum-water over the surface. So much for the process, and now for the cost. 60 grains of sulphate of copper, and 80 of bichromate of potass—the first solution—have hardly an appreciable pecuniary value, and indeed the chemist you deal with would not think of charging anything for so small a quantity of these substances; yet this solution will

be sufficient to take more than 200 copies. The second solution—half a dram of nitrate of silver—at four shillings per ounce, costs threepence, which, added to two ounces of water, and a few drops spread over the yellow negative picture, will be sufficient for between 50 and 100 pictures. As we have hinted, therefore, the expense of this elegant and useful amusement is, in reality, if we except the paper—which is cheap enough, you know—next to nothing at all. We may add, that the picture to be copied need not be taken out of the book, if it is in one: it is only necessary to place the prepared paper underneath its face, while the piece of glass laid upon its back will keep open the book, and allow access to the light.

II. *Another process.*—Make a solution composed of half a dram of nitrate of silver to two ounces of water, and spread a few drops of this solution over a sheet of paper by means of a glass phial. When dried in the dark, it is fit for use. Proceed precisely as in the above process, to copy the picture; and after being left exposed to the light for about five to fifteen minutes, according to the thickness of the picture, a negative picture will be found on the prepared paper, having the light part of the original dark, and the dark parts light. It now becomes the question how to turn this negative picture into a positive one, and this is effected in the following way: After the negative has been well washed in pure water, and fixed by passing it two or three times through a solution of common salt, it is ready, when dry, to print from. Prepare your sheet of paper in the same way as the other, and when dry, press its prepared side against the negative picture; then allow the back of the negative to be exposed to the light, and in a few minutes you will have obtained a fine positive picture, which can be fixed by passing it through a solution of common salt.

III. *Process for copying positive collodion portraits from glass on paper.*—Make a solution composed of half a dram of nitrate of silver to one and a half ounces of water, and spread a few drops of this solution, by means of a glass phial or rod, over a sheet of paper, which must then be put in a dark place till dry, when it is fit for use. The portrait or picture to be copied need not be taken out, but the back of the *passee-partout* merely opened. Sometimes liquid jet is employed for backing collodion pictures, but more commonly cotton velvet. If velvet, it can be removed, and a piece of the prepared paper, sufficient to cover the portrait, substituted, taking care that its prepared side be pressed against the collodion side of the portrait. Having done this, the face of the *passee-partout* may be exposed to the light, and in a few seconds the prepared paper at the back of the portrait will be seen to darken. When sufficiently dark, the *passee-partout* may be removed from the light, and the prepared paper taken off, when it will be seen to present a positive copy of the picture on the glass. To fix these impressions, just pass them once through a solution of common salt, and wash in pure water.

The expense of this process is hardly appreciable, since from 200 to 300 copies may be produced by half a dram of nitrate of silver, in one and a half or two ounces of water, the cost only threepence; two or three drops of which are sufficient for an ordinary sized portrait.

GLOSS FOR A HORSE'S COAT.

Lately going to the country to spend a few weeks with a friend of mine, I drove a very handsome horse, and a good one, but was always annoyed about his coat; it was more like a lot of bristles than a horse's smooth skin, and all the grooming he could get 'wouldn't do it no good.' My friend, who is a great horse-breeder and fancier, made me try giving him a few raw carrots every day to eat

out of my hand, betting me a basket of wine that he would have a good smooth coat in, three weeks; and he was right, for I lost my wine—all but three bottles, which I drank myself—but got in return a beautiful, sleek, glossy coat for my horse, which I would not change for a dozen baskets, and all from eating a few raw carrots daily. He tells me it is infallible. If you think your readers would profit by it, you may publish this suggestion in that valuable *Spirit* of yours.—*American paper.*

BETWEEN TWO WORLDS.

PARTING FOR AUSTRALIA.

HERE, sitting by the fire,
I aspire, love, I aspire—
Not to that 'other world' of your fond dreams,
But one as high and higher,
Compared to which your real, unreal seems.

Together as to-night,
In the light, love, in the light
Of our completed joy we see no shade;
And from our hope's reached height
All things are possible and level made.

So do we sit and view
Clear as true, love, clear as true,
That wondrous valley over southern seas,
Where in a country new
Your hands make for me a sweet nest of ease.

Where I, your poor tired bird—
(Nothing stirred? Love, nothing stirred?)
May fold her wings and be no more distressed:
And troubles may be heard
Like outside winds at night, which deepen rest.

Where in green pastures wide
We'll abide, love, we'll abide,
And keep content our patriarchal flocks;
See leaping at our side
Our little brown-faced shepherds of the rocks.

Ah, tale that's easy told!—
(Hold my hand, love, tighter hold:)
What if this face of mine—you think it fair—
If it should ne'er grow old?
Nor matron cap cover this maiden hair?

What if this silver ring
(Loose it clings, love, yet does cling)
Should ne'er be changed for any other?—nay,
This very hand I fling
About your neck, should—Hush! To-day's to-day;

To-morrow is—ah, Whose?—
You'll not lose, love, you'll not lose
This hand I gave, if never a wife's hand
For tender household use,
Led by yours fearless into a far, far-land.

Kiss me, and do not grieve:
I believe, love, I believe
That He who holds the measure of our days,
And did thus strangely weave
Our opposite lives together—to His praise!

He never will divide
Us so wide, love, us so wide:
But will, whatever chances, safely shew
That those in Him allied
In life or death are nearer than they know.

Printed and Published by W. and R. CHAMBERS, 47 Pall Mall, London, and 339 High Street, Edinburgh. Also sold by JAMES FRASER, 14 D'Olier Street, Dublin, and all Booksellers.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 165.

SATURDAY, FEBRUARY 28, 1857.

PRICE 1½d.

ANSWERS TO CORRESPONDENTS.

'How old is Mr Thackeray?' 'Who won the Derby in 1850?' 'What is a *fiat* in bankruptcy?' 'When did the Tipton Slasher fight his first mill, and who with?' 'Was Sir Robert Peel the premier ever a cotton-spinner, or was it his father, the first Sir Robert?' 'When did Mr Macready leave the stage?' 'In what year was Greenacre hanged?' 'Who could sing highest, Madame Catalani or Jenny Lind?' 'Is Mr Disraeli, or was he ever, a Jew?'

We have pondered much on these questions, contained in the *Weekly Luminary*, and read by fifty or a hundred thousand of the shopkeepers and work-people of London. Did these questions ever reach the sanctum of the editor, there to be read, ruminated over, investigated, and answered? If really sent, did they arise out of bets, or from a curiosity thirsting for all kinds of useful and useless knowledge? We have a theory that the truth comprises a portion of all these suppositions; but the reader will, perchance, not be sorry to accompany us in a ramble among the journals, to see how far, and under how many varieties of aspect, these odd questions and answers, notes and queries, present themselves; and we leave him quite at liberty to form his own judgment on the matter.

In the old days of the *Spectator* and *Tatler*, there can be no sort of doubt that 'Lesbia' and 'Will Hopeless,' and 'Monimia' and 'Sophronia,' were brain-products of the Addison and Steeles; and that the pretended letters from these correspondents were simply pegs whereon to hang pleasant essays. The great value of those effusions, apart from the delightful English in which they are written, consists in the picture they present of the state of society in the days of Anne and George I. In our own day, reading has penetrated to a lower stratum in society, though still not low enough; and we have no sort of doubt that, whether the 'answers' belong to actual 'questions' or not, there are tens of thousands of persons who would be glad of an opportunity for solving knotty doubts through the medium of the newspapers. The desultory and accidental accumulation of knowledge—new, or true, or both, or neither—by persons too much engaged with the bread-and-butter question to devote regular hours to study—plays no small part in forming the minds of those around us; and the weekly 'answers' thus become important, even if the querist be no more important than Mrs Harris herself. We say 'weekly,' for it is the weeklies that mostly do this work. There are ~~an~~ ^{two} crotchety almanacs that give algebraical and geometrical problems in each number, to be

answered by ingenious correspondents twelve months afterwards; but these lie quite out of our path. Nor do the majestic quarterlies come under notice: they scorn such small tactics as question and answer, being addressed to readers of education and high tone of taste and thought. The monthlies, too, though neither so few nor so 'far between' as the quarterlies, come pretty nearly under the same category in this matter. As for the dailies, who could expect queries and answers in papers so overwhelmed with business? Every issue is in itself a bundle of new facts, ready to be eagerly devoured by the world; and the editors have neither time nor space, inclination nor necessity, for groping into small answers on small subjects. Many of the weeklies, too, keep equally aloof. Some, of small circulation and high price, reach the hands of readers who would not care for such food; while a few others, of large circulation and low price, such as the reader has now before him, are almost wholly filled with matter original and paid for, and apportioned by the editor in conformity with a pre-arranged system, neither needing nor admitting the question-and-answer machinery.

Exceptions thus made, there remain a large number of weekly periodicals in London, and doubtless in other places, addicted to the fashion now under notice. The knowledge-box of Mr Editor is aided by the brains of other persons, briefless barristers included; and even if the questions be not really sent—well, no matter; the wisdom of the answer is just as good. Who knows but that many a blue bag in Westminster Hall, filled with nothing but flatulency, could, if it had the gift of speech, tell of its master earning a crust by answering legal questions in weekly newspapers, or by fashioning answers to imaginary questions? The journals devoted to special subjects—law, medicine, war, religion, music, theatricals, the fine arts, commerce, racing, hunting, the ring (not connubial)—have, as a matter of course, or are supposed by the readers to have, in their editorial sanctum, the wherewithal to solve problems on those specialties. We must except from any companionship with this large group of journals that delight of all bookworms, *Notes and Queries*, with its pages crammed full of facts for which we might hopelessly search elsewhere, and authenticated in so many cases by the real names of the writers.

Let us summon into court one week's budget, and look at it; and let us begin with a journal devoted to military and naval affairs. A question appears to have been asked touching the privileges of the much-favoured military staff, for Mr Editor says: 'There is nothing unusual in the medical officer's requiring the staff and their families to attend at his quarters; if

they are incapable of doing so, of course it is the surgeon's duty to attend on them.' The great beard-question is thus treated: 'A general officer can of course order the beard to be taken off: the moustache is allowed by regulation.' 'Cold Without and Damp Within' receives the following response to a complaint about camp-arrangements: 'Yes; you are not the only sufferer at the Colchester camp: the drainage is bad, or there would not be so many pools of water surrounding you.' A poor lieutenant, who finds it a tight matter to live like a gentleman on his pay, illustrates a query and a complaint by what he doubtless regards as satire steeped in poetry:

'Your services are very great,
Of them I'll take a note;
But can you serve the ministry?
Pray, have you got a vote?
An extra shilling still you ask,
But surely you should know
A Whig ne'er gave away a thing
Without a *quid pro quo*.'

Here is a journal devoted to the civil service. It tells a real or seeming correspondent—'The essential thing in applying to a minister or patron, is to know what to ask for—what place is meant or likely to become vacant. Unless you can specify the berth you aspire to, you will be put off with a vague promise, assured that your name has been put on the list of applicants, and there will be the end of it.' Nothing more likely, we would add. A man of humble mind, having the lowliest office in the customs department in his thoughts, is told: 'The candidate for a tide-waitership must be under twenty-five years of age; the examination prescribed is—writing from dictation, arithmetic in the first four rules, with the different weights and measures.' Next turns up a legal journal, in which the questions and answers are not on those matters of law which a lawyer may be supposed to know by heart, but on such professional points as the following: 'How can an attorney become a notary-public; what fees are there, and to whom payable?' Turn we next to a medical journal, where not only are there queries affecting diplomas, medical colleges, hospital lectures, surgical cures, pharmaceutical preparations, and medical apparatus; but practitioners seek to increase their knowledge by asking questions of each other. Thus, one medical man writes: 'Would any of your readers have the kindness to inform me where I can find an account of *Rodent ulcer*, or what are the important distinctions between it and *Epithelioma*? I have a case at present, which, so far as I can tell from the description I have consulted, appears to be one of rodent.' Very likely he will get an answer next week in the same journal.

Next, our eye lights upon a journal connected with mining affairs, and with the whereabouts of lodes, seams, veins, beds, strata, cross-courses, adits, and shafts. Mr Editor throws cold water on a querist who consults him about coal and collieries in Canada. Another correspondent is informed that 'The relations between landowners and mining-companies differ in different counties; that in Cornwall the ground is leased generally for twenty-one years; and that the rent paid is a royalty or percentage, varying from one-twentieth to one-eighth of all the produce raised.' Another journal, a luminary on railway matters, anxious to shew that railways are the great fact of the age, encourages or invents all kinds of queries thereupon, and allows correspondent A to answer correspondent B thus: 'As an instance of the value of railways, I have had a sack of potatoes up a hundred miles from the country at a cost of conveyance, including delivery at my door near London, of 1s. 9d.; by which, at about half-price, I have obtained better potatoes than I can get in London.' A third among

these useful, practical, commercial, manufacturing journals, draws out the following bit of boiler-wisdom: 'I have seen a boiler kept very clean by arranging a mud-collector in the form of a very large inverted funnel at the end furthest from the furnace, the funnel having a blow-off pipe at the bottom.'

The religious journals are not without their queries and answers, pertaining to matters consistent with the characters of the several works. Sometimes the *odum theologicum* peeps out, in the form of a query intended to poke fun at, or imply censure upon, a rival sect. Thus, a correspondent tells Mr Editor that, being at the house of a Conference friend, he found that smoking was in full operation, and that a barrel tobacco-bore bore the inscription, 'Conference Smoking Mixture'. Whereupon he asks: 'Can any of your readers throw light on this little Conference stranger? I thought it might perhaps be a sort of indulgence which that august body had thought fit to bestow on candidates for the ministry, who, prior to being admitted, have to abjure the use of tobacco: a sort of privileged exempted weed, intended for the use only of those in the ministry.' The editor, in all human probability, would not be disinclined to find or make an answer to this real or sham query, containing the usual amount of sarcasm on those who do not belong to 'our party'.

The sporting newspapers are especially rich in this kind of unpaid-for information. So many facts have a living interest in the minds of sporting-men—horse-racing, steeple-chasing, hunting, dog-fighting, cock-fighting, prize-fighting, yachting, boat-racing, crick, bowls, wrestling, quoits, golf, foot-running, pedestrianism, fishing, jumping, billiards, bagatelle, chess, draughts, backgammon, whist—games and sports indoors and out, with money-gambling and without—that they are, or these newspapers assume that they are, ever desirous of obtaining trustworthy information, especially on the laws or rules by which each sport is governed. The editor is always supposed to be 'up' in every part of his subject. Here, in the example now before us, a querist is told that 'Whatever the sire or dam of a fighting-dog may be, no male for that purpose can, with any approach to certainty, count upon the game or punishing qualities of the whelp.' Another is informed, 'A horse may have twisted forelegs, fleshy feet, thrushes or corns, may be fretful and awkward in his slow paces—and yet be a brilliant hunter over a country.' Were these really queries, by real querists?

But of all these answers to correspondents, the most ample, curious, and important are those found in the Sunday, or rather Saturday, newspapers that circulate among the middle and working classes. There are several of these, the sale of which ranges from 50,000 to 150,000 copies per week. All the coffee-shops, eating-houses, and public-houses in London—for it is of London and its journals we chiefly speak—take in one or more of these journals; and as a newspaper of large size can now be purchased for twopenny, copies in great number find their way to the homes of tradesmen and working-men. Small shopkeepers as well as working-men greatly relish the bits of information given in these papers under the heading 'Answers to Correspondents.' Whether there are really any such correspondents, and how many if any, and if none, how much a column the author is paid for his answers, are secrets buried in the tremendous breast of the editor. At anyrate, if no queries are put, they might be put, and they justify the answers hypothetically if not *bona fide*. Let the reader look over our shoulder at the following curious medley: 'Fieschi's attempt on the life of Louis Philippe was made in 1835.' 'Bismuth is a metal.' 'The bayonet takes its name from Bayonne, where it was invented.' All these appear as if answers to direct questions. In the next example, a correspondent and Mr Editor agree in taking to task a distinguished

writer for a *lapse* in composition: 'Is the following correct in its grammatical construction? "Before Maggy could open the door, Mr Pancks, opening it from without, stood without a hat, with his bare head in the wildest confusion, looking at Clennam and Little Dorrit over her shoulder."' To which query Mr Editor replies, that Charles Dickens is at fault; the proper construction being, 'looking over her shoulder at Clennam and Little Dorrit.' Plain matter of fact then appears: 'Brighton chain-pier is 1184 feet long.' Then a bit of commerce: 'The amount of bills of exchange in circulation at one time, in the ordinary state of public credit, is L.140,000,000.' Then a confession of editorial ignorance on a matter pertaining to balloon novelties: 'We cannot name any person who would be likely to speculate in a balloon-steering apparatus.' Here follows a sensible reply to a supposed question on which publishers—more shame to them—are not seldom on a blunder-track: 'Bi-monthly strictly means *every two months*, but the phrase is frequently used for *fortnightly*.' And now we encounter a piece of information, professedly an answer to a question put by some *Paterfamilias* anxious for the economical education of his children: 'Take up your quarters near Tonbridge Wells. There are free grammar-schools there, with sixteen exhibitions of L.100 each to the universities, two of L.75, one of L.20, and six of L.16. All boys are considered foundationers whose parents or guardians live within ten miles of Tonbridge.' By a startling jump, without any preparation whatever, we come to the very delicate subject of a lady's age: 'Madame Vestris was fifty-nine years of age at the time of her death.' Some *Thespis* or *Thalia*, presumably yearning to follow the footsteps of the *Faucits* or *Nisbetts*, or perhaps the *Rachels* or *Ristoris*, is told: 'You must work hard, and serve an apprenticeship in the provinces, to be capable of keeping a good position on the London stage.'

So curious and practically serviceable are many of the answers given, whether to real questions or not, that an industrious compiler has lately brought into a compact volume several thousand such, from a dozen or more of the London periodicals, based on a principle of selection in which the useful rather than the merely entertaining is studied. Especially is the collection rich in legal lore, matters relating to debts, bills, notices, contracts, apprentices, and so forth. The questions and answers relating to *wives* are not the least curious, nor, it must be added, the least mournful, as indicative of thoughts or troubles in which the welfare of women has a share. 'How can a wife, deserted by her husband, enforce claim for support?' 'Is not a wife, who refuses to maintain her children, punishable as a vagrant?' 'Has a wife, who deserts her husband, any right to her children or to her husband's property?' 'When is a wife's evidence against her husband admissible?' 'Can the wife of a convict marry?' 'If a husband deserts his wife, and she remains ignorant of his whereabouts for seven years, can she legally marry again?' It must in justice be stated, that the queries relating to husbands are nearly as numerous as those affecting wives.

The most amusing, unquestionably, of these communications bear relation to the tender passion and its important affairs. Some of the journals, of small price and large circulation, profess to give ready admission to queries and expressions of sentiment from swains and maidens, on love, courtship, marriage, flirtation, bridal etiquette, and the like, and as readily give answers or advice. *Clara* is informed: 'We think our correspondent has been acting very imprudently. A young lady should wait to be sought; she seldom gains much in esteem or admiration by taking the initiative in love-affairs. It may please the fancy of a man for a day or two to be courted by a pretty girl; but cool reflection will in due time suggest that

she may possibly be as charming to some other favoured swain as to himself.' *Eveline de Courcy* (these supposititious young damsels mightily affect fine names) is told that she 'must just follow her own feelings; we cannot prescribe rules for the treatment of other persons' acquaintances. If you want to get thoroughly rid of them, cut them; if you want to keep them at a distance, be cool to them: they will understand you.' Who 'they' are, is a mystery known only to Clara and the editor. *Edwin* is advised: 'Don't be too hasty; you know not what changes may take place in your mind and circumstances within a year or two. Make no long engagements with young ladies; neither they nor you are to be trusted.' Edwin is probably not yet quite eighteen. Was it love, or delicate sensibility, or Byronic moodiness, or sublimity in an all-round collar—was the querist a lady or a gentleman, to draw forth the following editorial response?—'We have passed through many a dream of thought, like our correspondent, and found comfort and sorrow mixed up in all. Life is a compound of the bitter and the sweet, and the one seems necessary to correct the tendencies of the other. The tree of the knowledge of good and evil is the Tree of Life.' Which profound aphorism we will leave to work its due results on the mind of the reader.

GLIMPSES OF AFFAIRS IN AMERICA.

THE STRUGGLE IN KANSAS.

THE election of a delegate to congress, from the territory of Kansas, in November 1854, was followed, as has been said, by dire events. The free settlers were indignant at the unauthorised voting of pro-slavery men from Missouri, and the Missourians endeavoured by acts of outrage to intimidate and expel the settlers. Violence, however, had not yet attained its climax. The great struggle was to take place on the 30th of March 1855, when the inhabitants were to choose a legislature. Preparatory to this event, Governor Reeder caused a census to be taken of the population, which was found to consist of 8501 souls. This number included the unenfranchised part of the community, 242 slaves and 151 free negroes; those entitled to vote amounting to 2905.

As the great day approached, parties of Missourians entered the territory, and planted themselves at every polling-place, with the avowed design of voting for candidates who would make Kansas a slave state. As many as 5000 of these desperadoes, equipped with arms, and bringing tents and provisions, thus took their ground, resolved to commit a grossly illegal act, by representing themselves as actual inhabitants of the territory. As there is not usually any register of voters in the States, where elections are often a kind of scramble—the very sheriffs, on such occasions, lending themselves to party purposes—it is not difficult for bands of resolute individuals to carry everything as they please. Even in the city of New York, at the last election, as is stated by the local press, parties of rowdies floated from polling-place to polling-place, and cast votes at them all, in order to return their favourite candidate. How much more easily could such infamous proceedings go on in the wildernesses of Kansas!

Well, the election takes place. Notwithstanding threats of personal violence, the settlers came pretty freely forward; but of what avail against the host of intruders? On examination, it was found that the number of legal voters was 1310, and of illegal voters, 4908. With the exception of two, all the members returned were pro-slavery men, and a number of them were residents in Missouri. It being the duty of the governor to receive the returns, and grant certificates to enable members to assume office, Reeder, after, as

is alleged, investigating each case, set aside the election in seven disputed districts, thus creating two vacancies in the council and nine in the house of representatives. He issued a certificate, besides, to one member of council and one member of the house, not the individuals whom the judges of the election had returned. To all the remainder, consisting of eleven councilmen, and seventeen representatives, he granted certificates. On his ordering a new election to be held on the 24th of May for filling up the vacancies, the pro-slavery party broke into a storm of indignation. They declared that no special election was valid under the organic law; they resolved to disown the authority of the present one, and vowed vengeance against Reeder and all who adhered to him. Without waiting for the new election, the governor, in April, issued his proclamation, summoning the legislature to meet at Pawnee City—a congeries of tents and deals about a hundred miles from the frontier—on the 2d of July.

At the May election, there was little disturbance, and the free-soilers had almost everything their own way; the result being the return of a number of new members, to whom the governor granted certificates. There were now, as we may say, double returns, some apparently valid, others the reverse. No proceedings, however, were founded on this point till the assembling of the two houses, when, on the third day of the session, a committee made a report respecting disputed elections. Not to go into tiresome minutiae, the result of the inquiry was, to deprive of his seat one of the members whom the governor had certified in March, and to turn out six members certified under the election in May—the effect of the whole being to restore affairs to nearly that position in which they had been placed by the outrageous intrusion of the Missourians in March. Reeder, it may be presumed, had now an opportunity of repudiating a legislature so vitiated by its own act, but, as previously hinted, though a man of good intentions, he was scarcely fitted for controlling the wild democracy over whom he was called to rule. One of the earliest projects started in the house of representatives was the removal of the seat of legislature to Shawnee Mission, near the borders of Missouri; and a bill to this effect was sent to the governor, who, on the 6th of July, returned it with a message declining to sanction the proposed change. His reason was, that the legislature had transcended its authority in adopting this particular measure; but in making this communication, he distinctly recognised the council and house of representatives as constituting the legislature of the territory of Kansas. As may be supposed, the legislative body paid no attention to the governor's objections, and accordingly removed, on the 16th of July, to a school-house at Shawnee Mission. Still, the governor by messages respecting bills continued to recognise the authority of the legislature, although at the same time, on the 21st of July, he declared that, by the act of removal, the two houses were dissolved, and henceforth he suspended all intercourse with them. We are conscious that these are dry details, but being gathered chiefly from a report of congress respecting the struggle in Kansas, and freed from party exaggerations, they throw a useful light over what has become a question of deep interest connected with the progress of slavery. Up to the point we have reached, the Missouri intruders were clearly in the wrong; the denunciations in their newspapers and speeches at the public meetings were atrocious—language which we could not possibly transfer to these pages. But unfortunately, Reeder, in whose hands was the destiny of Kansas, compromised freedom. His recognition of the corrupt legislature on the 21st of July, was a grave blunder; for in a legal point of view (as we humbly assume), no subsequent repudiation of that body could deprive it of an authority he had already acknowledged. The

false position taken by Reeder was greedily seized hold of by his antagonists, who, as an explanation of his conduct, alleged that his preference for Pawnee arose from the fact of his having town-lots to dispose of in that quarter. Whatever truth may be in the scandal circulated on the occasion, there can be no doubt, if we are to believe Phillips, that Shawnee was a much more agreeable place of meeting than Pawnee. 'At the Mission, the legislature were at home; that is, they were nearly so. It was only one mile from the Missouri line, and four miles from Westport. Hacks left the Mission every evening, on the adjournment, taking the members to Westport, and brought them back in the morning. And such splendid junketings and racketings these fellows had! A due supply of whisky was brought in bottles and jugs each morning, in order to keep the legislature in spirits during the long summer days.'

Having set to work, the *Bogus* legislature, as this body is usually designated, speedily produced a code of laws connected with 'slave property,' such as the world has not seen for many a day. The following are a few of the penalties: To any person concerned in raising an insurrection among slaves, or free coloured persons—death. To any person who shall entice, decoy, or carry away any slave from the territory—death, or imprisonment for ten years with hard labour. To any person who shall entice or persuade a slave to escape from his master—imprisonment for ten years with hard labour. To any person resisting an officer who attempts to arrest an escaped slave—imprisonment with hard labour for two years. The following sections are too good to abridge:

'If any person print, write, introduce into, or circulate, or cause to be brought into, written, printed, or circulated, or shall knowingly aid or assist in bringing into, printing, publishing, or circulating within this territory, any book, paper, pamphlet, magazine, handbill, or circular containing any statements, arguments, opinions, sentiment, doctrine, advice, or innuendo calculated to produce a disorderly, dangerous, or rebellious disaffection among the slaves of the territory, or to induce such slaves to escape from the service of their masters, or to resist their authority, he shall be guilty of felony, and be punished by imprisonment at hard labour for a term not less than five years. If any free person, by speaking or writing, assert or maintain that persons have not the right to hold slaves in this territory, or shall introduce into this territory, print, publish, write, circulate, or cause to be introduced into the territory, written, printed, published, and circulated in this territory any book, paper, magazine, pamphlet, or circular, containing any denial of the right of persons to hold slaves in this territory, such person shall be deemed guilty of felony, and punished by imprisonment at hard labour for a term of not less than two years. No person who is conscientiously opposed to holding slaves, or who does not admit the right to hold slaves in this territory, shall sit as a juror on the trial of any prosecution for any violation of any of the sections of this act.' This extraordinary code was subscribed by J. H. Stringfellow as Speaker of the house, and Thomas Johnson (the Rev. Tom), President of the council.

The bills passed by the *Bogus* legislature being, as a matter of form, submitted to Reeder for his sanction, he transmitted a message in reply, stating that his opinion remained unchanged respecting the illegality of that body, but that independently of this fact, he had received official intimation that his functions as governor were withdrawn. The latter part of this reply was probably anticipated; for the legislature had memorialised the president to remove the governor from office; nor can we feel any surprise at his dismissal. Will it be credited—his message just

alluded to (August 16) was still addressed 'To the honourable the members of the council and house of representatives of the territory of Kansas'—an acknowledgment of their authority at variance with his repeated declarations, and greatly calculated to complicate the whole question. Amidst these difficulties, the Bogus legislature obtained an opinion from Judge Lecompte, to the effect, that the bills passed would receive the force of law without the signature of the governor, and so they appear to have actually come into operation.

Reader, who now withdrew into private life, was replaced by Governor Shannon, who was declared to be 'sound on the goose'—that is, in favour of slavery in the territory—and who, in general character, was no improvement on his predecessor. Indignant at being subjected to laws which they believed to rest on no proper authority, and exposed to personal sufferings from the Missourians, the citizens of Kansas spent the summer of 1855 in a state of extreme agitation. The proper means for redress lay in a calm appeal to congress. They did memorialise that body on the subject of their grievances; and ultimately a committee inquired into and reported on the subject at voluminous length. Without, however, waiting for the action of the supreme government, the citizens of Kansas held mass-meetings denunciatory of their oppressors, and went the extreme length of appointing a governor, C. Robinson, to 'occupy the executive chair of the new state of Kansas.' Under this official took place an entirely new organisation of the territory—alleged by the parties concerned to be exactly in terms of the constitution, but considered by the supreme government as totally irregular and inadmissible. The people in the several districts elected delegates, with perfect seriousness, to constitute a convention, or rival body to the Bogus legislature; and on the meeting of the assembly on the 19th of September at Topeka, a message was delivered from 'Governor Robinson,' which would have done no discredit to the resident of the United States.

Looking at the acts and resolutions of the Topeka convention, it was decidedly the better legislature of the two. Considering the nature of its materials, and the circumstances calling it into existence, one cannot but feel amazed at the cool and business-like way in which it set aside the whole proceedings of the Bogus assembly, drew up a constitution, organised committees on education and other affairs, and appointed an executive for the territory. None but an American, however, can do justice to its character. 'This constitutional convention,' says Phillips, 'was by far the most respectable body of men in point of talent, that was convened in Kansas; indeed, it would have compared favourably with legislative bodies anywhere. Talent, and the weak vanity which aposes it, were there; no virtue, and a more plastic school of morality; strictness, and number-one-ism; outside influence, and lobby; sober, staid, business habits, brandy, temperance, whisky, prayers by the chaplain, profanity, and oyster-suppers. It lacked none of the great essentials.' Taken all in all, it was an honourable body, with the usual sprinkling of skilful politicians, who knew how to indoctrinate an infant community with the principles of party manœuvring.

There were now two rival parliaments in Kansas, each thundering forth laws; but of what use are all the laws in the world, if there is nobody to execute them? Even in despotic countries, it is the people who control the people. The Bogus legislature of Kansas was an exotic, the governor an exotic, and the judges and sheriffs exotics: the people repudiated the whole concern, and defied them. There being, properly speaking, neither law nor government, and outrages being of

daily occurrence, the settlers got up secret military organisations, the chief of these being called the Kansas Legion—a kind of *Vehmgericht*, holding mysterious meetings, and the members of which recognised each other by peculiar signs. To counteract these movements, and aid the Bogus legislature, the pro-slavery men held what they called a 'Law and Order Convention' at Leavenworth on the 14th of November; and of this professed auxiliary of the constituted authorities, Governor Shannon was appointed president. From this period may be dated the condition of anarchy in Kansas. At all points, there was open defiance between the two parties. Of the fights, slaughterings, burning of houses, destruction and stealing of property, and personal outrages of every kind, we are fortunately spared from giving any account, as ample details of the atrocities committed by the border ruffians have been made widely known, and more particularly as that greatest atrocity of all, the burning and sacking of the city of Lawrence, in May 1856, must be fresh in every one's recollection. By Mrs Robinson, wife of Governor Robinson, who was carried away a prisoner, a circumstantial and graphic account of the troubles in Kansas has been given to the world.

In July 1856, the Topeka convention was brought to a termination by order of Colonel Sumner, at the head of a troop of dragoons, despatched by the supreme government to suppress the insurrections in the territory. With the interruption of the free-state convention, the seizure of some prisoners, and the occupancy of Kansas by the federal forces, the territory was substantially handed over to the Missourians. How far the president was justified in sending an army into Kansas, has been matter of much angry discussion; his proceedings in this respect, while ostensibly designed to keep the peace, had the effect of vindicating the conduct of the Missourian intruders, and leaving the actual settlers helpless. The subject, it will be recollected, brought congress to a dead-lock at the end of August 1856, when an appropriation for the army required to be voted. On this occasion, the members of the House of Representatives from the free states had it in their power to stop the supplies, and thus withdraw the army from Kansas. This grand chance of historical renown was not embraced. By a majority of 101 to 98, the vote for appropriation was ultimately carried—21 members from free states swelling the majority.

Under Governor Geary, Kansas has latterly been tranquil, and things may be said to be mending. But the laws of the Bogus legislature, which impose and bolster up slavery, remain in force, and whether they will be abolished by local or federal authority, is uncertain. Practically, Kansas is a slave territory, and will to all appearance be a slave state. Some New York newspapers, we observe, are recommending free-state emigrants to proceed to the territory, which presents cheap and fertile lands for settlement; and, considering the mighty stake at issue, we are not surprised that fresh attempts should be made to pour in an independent class of settlers. He would ill understand the nature of the struggle in Kansas, who supposed it to relate solely to the freedom of that territory. No doubt, that was the great and proximate object; but when we say that by making Kansas free, slavery would be checked in its north-western flank, and receive a severe blow throughout its whole system, the character of that desperate life-and-death struggle, which we have faintly portrayed, will perhaps be better understood. That the Americans, to whom this is no local squabble, but a thing of national concern, will sit down quietly with matters as they are, we cannot believe. Indeed, their reputation as a people may be said to be perilled on the result of the question; and we are hardly going beyond the truth in saying, that the world waits with

some interest to learn the issue. Possibly, some one on whom has dropped the mantle of Henry Clay, may propose a new Compromise!

In judging of past events in this unhappy territory, a sense of impartiality obliges us to say that all parties were in the wrong. Congress committed in the first place a grievous wrong, by instituting squatter sovereignty in direct opposition to the Missouri Compromise. Pierce seems to have done wrong throughout, in his invariable leaning to the pro-slavery party, and so encouraging their aggressions. Then, as regards the two local parties, wrong was met with wrong, illegality by illegality. The intrusions of the border ruffians were in every point of view iniquitous; but the free-soil settlers, though grossly insulted and oppressed, did surely wrong in inaugurating an illegitimate legislative convention, and in trying to support their plans by secret military organisations. As for Reeder, the central figure in the group of wrong-doers, he, by his incorrigible folly, rendered confusion worse confounded—a fine instance of what mischief may be done by good easy men, when placed in circumstances demanding vigour of character. For all these complications of wrong, of which no one can yet see the end, the more peaceful and honestly disposed immigrants to Kansas paid a heavy penalty. Their sufferings were acute, their losses ruinous. Of the deplorable condition to which their agricultural operations were reduced, we could advance no more convincing proof than that which above all things shocks the sensibility of an American—*white* women were seen labouring in the fields!

W. C.

THE FIRST RAGGED SCHOOL.

THE Scotch pique themselves a little on having taken the first step in this movement, and have good reason for the self-gratulation. No doubt, so far as the British Isles are concerned, the first of these institutions originated in the north; but few of us are perhaps aware that, in the little town of Weimar, 'where,' as Professor Blackie hath it, 'fair Peace her bloodless victories tells,' such an institution flourished seven-and-thirty years ago.

The life of Frederick Perthes, which has been lately translated, has presented to the English public a picture of German life—a picture of a good man's mind, and of domestic happiness such as has been seldom seen; and among the various subjects of interest treated of in these volumes, public and private, secular and theological, the chapter on the first Ragged School and its founder is one of the most attractive. One thing very notable is, that John Falk, to whom the honour is due of having been the first in this good work, was not a man of any great intellectual power—a large heart, a disinterested, warm, unselfish nature, united with complete devotion to the one object, insured success; though in his literary undertakings he had previously been a butt for the ridicule of his learned countrymen. Falk was a native of West Prussia, and had come to reside in Weimar, when his compassion was excited by the number of children left destitute by the battles of Jena, Lützen, and Leipzig, which had left them fatherless, and who now wandered, like wild beasts of the forest, in the neighbourhood of those scenes of horror. These young savages were the wreck of Napoleon's armies—dark-eyed boys from southern France and sunny Italy, besides a multitude from all the tribes of Germany. Of these, Falk collected more than 800, and took them into his own house, and resolved to devote his life to the task of reclaiming them, and giving them the blessings of education and an honest calling. To do so, besides his own devotion and energy, large funds were necessary; and part of his unpopularity may well be ascribed, not only to his eccentricities,

his riding his hobby very hard, but to his being a bold and untiring beggar—a bore, in short—the burden of his song being always 'give, give.' Having himself given his soul and body to the work of saving souls, he could not understand any one being lukewarm in such a cause, or stinting either their labour or their substance. Falk wisely said, speaking of the abuses of the time, 'nor will matters be mended so long as men regard preaching and the hearing of preaching as a Christian act, whereas Christian action is itself the true sermon.' He acted up to this principle, and night and day gave himself to the work. He had much to disappoint, but still more to encourage him, and was determined never to see difficulties. When his house was sold by the proprietor, he naturally found no one very willing to receive him and his 800 children into another: he therefore resolved to build, and to do the whole by the hands of his children; 'so that,' as he said, 'every tile in the roof, every nail in the walls, every lock on the doors, every chair and every table in the rooms, shall be a witness to their industry.'

To any one familiar with our Ragged Schools, the following description, given by Perthes, of the first Ragged School, which he visited in 1822, is very significant: 'About fifty journeymen and apprentices, all of them former inmates of the Ragged Hospital, were working at the new building as masons and carpenters. They were served by boys still in the institution: horrid, cannibal-like faces they all had, with the red of the desert unmistakably imprinted on their foreheads. In the expression of many, however, there were traces of a new life; and Falk says it is a real pleasure to see how the claws and the shaggy tufts gradually fall off.'

Falk's work and life-labour was crowned with great success. No doubt, many of his protégés returned to their wild ways, still a much larger number grew up sober and industrious citizens; and many a thriving artisan, in his happy and peaceful home, blessed the memory of his benefactor, who had taught him the first lesson of rectitude and self-respect. Also that has taken place of which he was himself so confident—the idea which possessed him has spread throughout Christian Europe; and though the name of the whimsical John Falk is seldom heard, the desire of his heart is accomplished. Wherever there is want and misery, there also there is a door open for the children of the destitute to learn the great lesson how to live for the world and for the next. And in our days, Industrial Schools have noble lords for their managers, and dainty ladies for their patrons.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXVIII.—RUBE ROASTED ALIVE.

DOOMED beyond doubt—doomed to quick, awful, certain death was the earless trapper. In five minutes more he must perish. The wall of flame, moving faster than charging cavalry, would soon envelop him, and surer than the carbine's volley or the ke sabre-cut was the death borne forward by that hissing crackling cohort of fire. Here and there, tall jets shooting suddenly upward, stalked far in advance the main line—fiery giants, with red arms stretched forth, as if eager to grasp their victim. Ahead their hot breath was upon him; another minute, and he must perish!

In a sort of stupor we stood, Garey and I, watching the advance of the flames. Neither of us uttered word: painful emotions prevented speech. Both of hearts were beating audibly. Mine was bitter

wring; but I knew that of my companion was enduring the very acme of anguish. I glanced upward to his face: his eye was fixed, and looked steadfastly in one direction—as though it would pierce the sheet of flame, that rolled further and further from where we stood, and nearer to the fatal spot. The expression of that eye was fearful to behold; it was a look of concentrated agony. A single tear had escaped from it, and was rolling down the rude weather-bronzed cheek, little used to such bedewing. The broad chest was heaving in short quick spasms, and it was evident the man was struggling with his breath. He was listening through all this intensity of gaze—listening for the death-shriek of his old comrade—his bosom-friend!

Not long was the suspense; though there was no shriek, no cry of human voice, to indicate the crisis. If any arose, it was not heard by us. It could not have been; it would have been drowned amid the roar of the flames, and the crackling of the hollow culms, whose pent-up gases, set free by the fire, sounded like the continuous rolling of musketry. No death-cry fell upon our ears; but, for all that, we were satisfied that the drama had reached its dénouement: the unfortunate trapper was roasted alive!

Already the flames had passed over the spot where we had last seen him—far beyond—leaving the ground charred and black behind them. Though the smoke hindered our view of the plain, we knew that the climax had passed: the hapless victim had succumbed; and it remained only to look for his bones among the smouldering ashes.

Up to this moment, Garey had stood in a fixed attitude, silent and rigid as a statue. It was not hope that had held him thus spell-bound; he had entertained no such feeling from the first: it was rather a paralysis produced by despair. Now that the crisis was over, and he felt certain that his comrade had perished, his muscles, so long held in tension, suddenly relaxed—his arms fell loosely to his sides—the tears chased each other over his cheeks—his head reclined forward, and in a hoarse, husky voice he exclaimed:

'O! he's rubbed out, rubbed out! We've seed the last o' poor Old Rube!'

My sorrow, though perhaps not so keen as that of my companion, was nevertheless sufficiently painful. I knew the careless trapper well—had been his associate under strange circumstances—amid scenes of danger that draw men's hearts more closely together than any phrases of flattery or compliment. More than once had I seen him tried in the hour of peril; and I knew that, notwithstanding the wildness and eccentricity of his character—of his crimes, I might add—his heart, ill directed by early education, ill guided by after-association, was still rife with many virtues. Many proofs of this could I recall; and I confess that a feeling akin to friendship had grown up between myself and this singular man.

Between Garey and Rube the ties were still stronger. Long and inseparable companionship—years of participation in a life of hardships and perils—like thoughts and habitudes—though perhaps dispositions, age, and characters were a good deal unlike—all had combined to unite the two in a firm bond of friendship. To use their own expressive phrase, they '*froze*' to each other. No wonder then that the look, with which the young trapper regarded that black plain, was one of indescribable anguish.

To his mournful speech, I made no reply. What could I have said? I could not offer consolation. I was weeping as well as he: my silence was but an assent to his sad soliloquy.

After a moment he continued, his voice still tremulous with sorrow: 'Come, comrade! It are no use our cryin like a kuppel o' squaws.' With his large finger he dashed the tears aside, as if ashamed of having shed them. 'It are all over now. Let's look arter his bones—that is, if thar's anythin left o' 'em—and gie 'em Christyun burial. Come!'

We caught our horses, and mounting, rode off over the burnt ground. The hoofs of the animals tossed up the smouldering ashes, the hot red cinders causing them to prance. The smoke pained our eyes, and prevented us from seeing far ahead; but we guided ourselves, as well as we could, towards the point where we had last seen the trapper, and where we expected to find his remains.

On nearing the spot, our eyes fell upon a dark mass that lay upon the plain: it was much larger than the body of a man. We could not make out what it was, until within a few feet of it, and even then it was difficult to recognise it as the carcass of a buffalo—though such in reality it was. It was the game which the trapper had killed. It rested as it had fallen—as these animals usually fall—upon the breast, with legs widely spread, and humped shoulders upward. We could perceive that the unfortunate man had nearly finished skinning it—for the hide, parted along the spine, had been removed from the back and sides, and with the fleshy side turned outward, was hanging to the ground, so as to conceal the lower half of the carcass. The whole surface was burnt to the colour of charcoal.

But where were the remains of the hunter? They were nowhere to be seen near the spot. The smoke had cleared away sufficiently to enable us to observe the ground for several hundred yards around us. An object of small dimensions could have been distinguished upon the now bare surface; but none was seen. Yes! a mass lay beside the carcass, which drew our attention for a moment; but on riding up to it we perceived that it was the stomach and intestines of the buffalo, black and half broiled.

Where were the bones of Rube? Had he run away from the spot, and perished elsewhere?

We glanced towards the fire still raging on the distant plain. But no: it was not probable he had gone thence. By the last look we had obtained of him, it did not appear that he was making any effort to escape, and he could scarcely have gone a hundred yards before the flames swept over the spot. How then? Were his bones entirely consumed—calcined—reduced to ashes? The lean, withered, and dried-up body of the old mountain-man favoured such a supposition; and we began seriously to entertain it—for in no other way could we account for the total absence of all remains!

For some moments we sat in our saddles under the influence of strange emotions, but without exchanging a word. We scanned the black surface round and round. The smoke no longer hindered our view of the ground. In the weed-prairies there is no grassy turf; and the dry herbageous stems of the annuals had burned out, with the rapidity of blazing flax, so that nothing now remained to cause a smoke. The fire was red or dead in an instant. We could see clear enough all that lay over the ground, but nothing like the remains of a human being!

'No,' said Garey, with a long-drawn sigh. 'Poor Old Rube! The cussed thing has burned him to ashes—bones an all! Thur ain't as much o' im left as 'ud fill a tabacca-pipe!'

'What! thur ain't!' replied a voice that caused both of us to start in our saddles, as if it had been Rube's ghost that addressed us—'thur ain't!' repeated the voice, as though it came out of the ground beneath our feet. 'Thur's enough o' Ole Rube left to fill the stummuk o' this hyur bufler; an by the

jumpin' Geehosopah, a tight fit it ur! Wagh! I'm nigh suffocated! Gie's yur claws, Bill, an pull me out o' this hyur trap!'

To our astonishment the pendent hide of the buffalo was raised by an invisible hand; and underneath appeared, protruding through a hole in the side of the huge carcass, the unmistakable physiognomy of the earless trapper!

There was something so ludicrous in the apparition, that the sight of it, combined with the joyful reaction of our feelings, sent both Garey and myself into convulsions of laughter. The young trapper lay back in the saddle to give freer play to his lungs; and his loud cachinnations, varied at intervals by savage yells, caused our horses to dance about as if they dreaded an onslaught of Indians!

At first, I could detect a significant smile at the angles formed by Rube's thin lips; but this disappeared as the laughter continued too long for his patience.

'Cuss yur larkin!' cried he at length. 'Kum, Billee, boy! Lay holt hyur, an gi' me a help, or I must wriggle out o' meself. The durned hole ain't es big es twur when I krep in. Durn it, man, make haste! I'm better'n half-baked!'

Garey now leaped from his horse, and taking hold of his comrade by the 'claws,' drew him out of his singular hiding-place. But the appearance of the old trapper, as he stood erect—red, reeking, and greasy—was so supremely ludicrous, that both Garey and I were forced into a fresh fit of laughter, which lasted for several minutes.

Rube, once released from his uncomfortable situation, paid not the slightest attention to our mirth; but stooping down, drew out his long rifle—from where he had secured it under the hanging skin—and after having examined the piece, to see that no harm had come to it, he laid it gently across the horns of the bull. Then taking the 'bowie' from his belt, he quietly proceeded with the skinning of the buffalo, as if nothing had happened to interrupt the operation.

Meanwhile Garey and I had laughed ourselves hoarse, and, moreover, were brimful of curiosity to know the particulars of Rube's adventure. For some time he fought shy of our queries, and pretended to be 'miffed' at the manner in which we had welcomed him to life again. It was all pretence, however, as Garey well knew; and the latter having thrust into his comrade's hand the gourd, still containing a small drop of *aguardiente*, soon conciliated him; and after a little more coaxing, he condescended to give us the details of his curious escapade. Thus ran his narration:

'Ee wur both o' yur mighty green to think thet arter fightin' grizzly bar an Injun for nigh forty yeern on these hyur parairas, I wur a gwine to be rubbed out by a spunk o' fire like thet. Preehaps 'twur nat'ral enough for the young fellur hyur to take me for a *greenhorn*, seen as he oncest tuk me for a *grizzly*. He, he, he—ho, ho, hoo! I say it wur, an ur nat'ral enough for him to a thort so; but *you* mout a knowd better—you, Bill Garey, seen as ee oughter knowd me.

'Wal!' continued Rube, after another 'suck' at the gourd, 'when I seed the weeds afire, I knowd it wa'n't no use makin' tracks. Preehaps if I'd a spied the thing when the bleeze fust broke out, I mout a run for it, an mout a hed time; but I wur busy skinnin' this hyur beest wi' my head clost down to the karkidge, an thurfor hedn't see nuthin' till I heern the cracklin', an in coorse thur wa'n't the ghost o' a chance to git clur then. I seed thet at the fust glimp.

'I ain't a gwine to say I wa'n't skeart; I wur skeart, an bad skeart too. I thort for a spell, I wur boun to go under. Jest then I sot my eyes upon the buffler. I hed got the critter 'bout half-skinned, as ee see; an the idee kim inter my head, I mout crawl somehow under, an pull the hide over me. I tried thet plan fust; but I kudnt git kivered to my saterfaction, an I gin it up.

A better idee then kim uppermost, an thet wur to clur out the anymal's inside, an thur *caché*. I reck'n I wa'n't long in cuttin' out a wheen o' the buffler's ribs, an tearin' out the guts; an I wa'n't long neyther in squeezin' my karkidge, feet fo'most, through the hole. I hedn't need to a been long; it wur a close shave an a tight fit, it wur. Jest as I hed got my head 'bout half through, the bleeze kim swizzin' round, an nearly singed the ears off o' me. He, he, he—ho, ho, hoo!'

Garey and I joined in the laugh, at what we both knew to be one of Old Rube's favourite jokes; but Rube himself chuckled so long, that we became impatient to hear the end of his adventure.

'Well!' interrupted Garey, 'consarn your old akin! what next?'

'Wagh!' continued the trapper, 'the way thet bleeze did kum wur a caution to snakes. It roared an screeched, an yowled an hissed, an the weeds crackled like a million o' wagon-whups! I wur like to be spificated wi' the smoke, but I contriv to pull down the flap o' hide, an thet gin me some relief, though I wur well-nigh choked afore I got the thing fixed. So thur I lay till I heern you fellurs palaverin' about a 'bacca-pipe, and thurfor I knowd the hul thing wur over. Wagh!'

And with this exclamation Rube ended his narration, and once more betook himself to the butchering of the already half-roasted buffalo.

Garey and I lent a hand; and having cut out the hump-ribs and other titbits, we returned to the camp. What with broiled hyodons, roast ribs, tongue, and marrow-bones, we had no reason for that night to be dissatisfied with the hospitality of the prairies.

CHAPTER XXIX.

THE MESA.

After a breakfast of buffalo-flesh, seasoned with splendid appetites, and washed down by a cup of cold water from the arroyo, we 'saddled up,' and headed for a high *butte*, just visible over the plain. My companions knew the landmark well. It lay directly in our route. We should pass near its base, and a ride of ten miles further would bring us to the end of our journey; indeed, the eminence was within sight of the rancheria. From the roof of the alcalde's house, I had frequently noticed it. In clear weather only was it visible, outlined against the horizon, in a north-westerly direction from the village.

Struck with the singularity of this prairie-mound, I had projected a visit to it; but circumstances had prevented me from carrying out my intention. I was now to have the pleasure of a nearer acquaintance with it.

I have called it singular. Most isolated hills are conical, dome-shaped, or ridge-like; this one differed from the usual configuration—hence its singularity. It presented the appearance of a huge box set upon the prairie, not unlike that rare formation, the 'cofre,' which crowns the summit of the mountain Peroté. Its sides in the distance appeared perfectly vertical, and its top horizontal as the plain on which it rested.

As we drew nearer, I could perceive by the dark parapet-like band along its crest that it was covered with a growth of timber. This was the more readily observed from contrast with the perpendicular sides, which were almost of a snowy whiteness, on account of the gypsum, chalk, or milky quartz of which the rock was composed. The most peculiar feature of the mound was perhaps its apparently regular form—a perfect parallelopipedon. But it was striking in other respects. Its sides glistened fantastically under the rays of the sun, as though it were studded with windows of glass. This, however, was easily accounted for; and I knew that the sparkling effect was produced by plates of mica or selenite that entered into the

composition of the rock. I had seen whole mountains that presented a similar appearance. More than one such exists in the great American Saïra, in whose glittering cliffs, viewed from afar, may be found the origin of that wild chimera, the *mountain of gold*.

Although neither a mountain of gold nor silver, the mound in question was an object of rare interest. A very enchanted castle did it appear, and it was difficult to assign its formation to nature alone. Human agency, one could not help fancying, must have had something to do in piling up a structure so regular and compact. But he who has travelled over much of the earth's surface will have met with many 'freaks' of nature, exhibiting like appearance of design, in her world of inorganic matter. It was, in fact, one of those formations of which many are met with in the plateaux-lands of America, known in Spanish phraseology as *mesas*. This name is given to them in allusion to the flat table-like tops, which distinguish them from other elevated summits. Sometimes one of these mesas is found hundreds of miles from any similar eminence; more frequently a number of them stand near each other, like truncated cones—the summits of all being on the same level, and often covered with a vegetation differing materially from that of the surrounding plains. Geologists have affirmed that these table-tops are the ancient level of the plains themselves; and that all around, and intervening between them, has either sunk or submitted to the degradation of water! It is a vague explanation, and scarcely satisfies the speculative mind. The *mesa* of Mexico is still a geological puzzle.

As we approached this singular object, I could not help regarding it with a degree of curiosity. I had seen mesa heights before—in the 'mauvaise terre,' upon the Missouri, in the Navajo country west of the Rocky Mountains, and along the edges of the 'Llano Estacado,' which of itself is a vast mesa. The mound before us was peculiar, from its very regular form, and the sparkling sheen of its cliffs. Its complete isolation, moreover, added to the effect—for no other eminence appeared in sight. The low hills that bordered the Rio Grande could barely be distinguished in the distance.

On getting nearer to it, its character became somewhat altered; the square box-like form appeared less regular, and it was then perceived that the parallelopipedon was not perfect. Slight ledges could be traced traversing the face of its cliffs, and here and there the rectangular lines were broken to the eye. Nature, after all, had not been so exact in her architecture. Yet, with every deduction, it was a singular structure to look upon, not the less so that its summit was inaccessible to human foot. A precipice fifty yards sheer fronted outward on all sides; no one had ever scaled this precipice—so alleged my companions, who were well acquainted with the locality.

We had approached within less than a mile of its base; our conversation had dropped—at least so far as I was concerned; my thoughts were occupied with the mound, and my eyes wandered over its outlines. I was endeavouring to make out the character of the vegetation which seemed to flourish luxuriantly on its summit. The dark foliage was evidently that of some species of acicular trees, perhaps the common red cedar (*Juniperus Virginiana*); but there were others of lighter hue—in all likelihood *piñons*, the pines with edible cones, peculiar to this region. I noticed, also, growing upon the very edge of the cliff, yuccas and aloes, whose radiating blades, stretching out, curved gracefully over the white rock. Forms of cactus, too, were apparent, and several plants of the great *pitahaya* rose high above the cliff, like gigantic candelabra, strange objects in such a situation.

My companions seemed to have no eyes for these rare vegetable beauties; I could hear them at intervals

engaged in conversation; but the subject had no reference to the scene, and I paid little attention to what they were saying.

All at once I was startled by the voice of Garey, giving utterance to the emphatic announcement:

'Injuns, by —!'

'Indians!—where?'

The interrogation escaped my lips. It was half involuntary, and needed no reply. Garey's glance guided me; and, following its direction, I observed a string of horsemen just debouching from behind the mesa, and spurring forward upon the plain.

Both my companions had drawn bridle, and halted. I followed their example; and all three of us sat in our saddles, scanning this sudden apparition of mounted men. A dozen had now cleared themselves from behind the mesa, and were riding towards us.

We were yet nearly a mile from them; and at that distance it is difficult to distinguish a white man from an Indian—I should rather say impossible. Even at half the distance, the oldest prairie-men are sometimes puzzled. The garments are often not very dissimilar, and sun-bronze and dust confound the complexions. Although Garey, at first sight of them, had pronounced the horsemen to be Indians—the most probable supposition under the circumstances—it was but a random conjecture, and for some time we remained in doubt.

'If they're Injuns,' suggested Garey, 'they're Comanche.'

'An if thur Kimanch,' added Rube, with ominous emphasis, 'we've got to fight. If thur Kimanch, thur on the war-trail, an thur'll be mischief in 'em. Wagh! Look to yur flints an primin!'

Rube's counsel was instantly followed. Necessity quickened our precautions. All of us well knew, that, should the approaching horsemen turn out to be Comanches, we had no alternative but fight.

This warlike nation occupies the whole western area of Texas, ranging from the Rio Grande on the south, to the Arkansas on the north. They are to-day, with their kindred tribes, the most powerful Indian alliance on the continent. They affect the ownership of all prairie-land, styling themselves its 'lords,' though their sovereignty towards the north is successfully disputed by the Pawnees, Sioux, Blackfeet, and others as warlike as they. From the earliest times, they have been the *fiend* of the Texan settler; and a detailed account of their forays and pillaging expeditions would fill a score of volumes. But from these they have not gone back unscathed. The reprisals have outnumbered the assaults, and the rifle of the border-ranger has done its work of vengeance. In Mexico they have found less puissant defenders of the hearth and home; and upon the north-eastern provinces of that unhappy country, the Comanches have been for the last half-century in the habit of making an annual foray of war and plunder. In fact, this has become the better part of their subsistence, as they usually return from their rieving expeditions laden with spoil, and carrying with them vast droves of horses, mules, horned cattle, and *captive women*. For a short time, these dusky freebooters were at peace with the Anglo-American colonists of Texas. It was but a temporary armistice, brought about by Houston; but Lamar's administration, of a less pacific character, succeeded, and the settlers were again embroiled with the Indians. War to the knife was declared and carried on; red and white killed each other on sight. When two men met upon the prairie, the colour of the skin determined the relations between them! If they differed in this, they were enemies without parley, and to kill the other was the first thought of each. The *lex talionis* was the custom of the hour.

If the rancour could possibly have been augmented, an incident had just transpired calculated to have that effect. A band of Comanche warriors had offered their

services to the commander-in-chief of the American army! They held the following language:

'Let us fight on your side. We have no quarrel with you. You are warriors: we know it, and respect you. We fight against the cowardly Mexicans, who robbed us of our country. We fight for Moctezuma!'

These words, uttered along the whole northern frontier of Mexico, are full of strange import.

The American commander prudently declined the Comanche alliance; and the result was the bitter triangular war in which, as already noticed, we were now engaged.

If, then, the approaching horsemen were Indians of the Comanche tribe, Rube's forecast was correct; we had 'got to fight.'

With this understanding, we lost no time in putting ourselves in an attitude of defence. Hastily dismounting, and sheltering our bodies behind those of our horses, we awaited the approach of the band.

CHAPTER XXX.

GUERRILLEROS.

The manoeuvre had occupied only a few seconds of time, and the horsemen were yet distant. They had thrown themselves into a formation, and were riding 'by twos!'

This movement took us by surprise. The tactics were not Indian: Comanches never march in double file. The horsemen could not be Indians. Who, then?

A sudden hope crossed my mind, that it might be a party of my own people, out in search of me. 'By twos' was our favourite and habitual order of march. But no; the long lances and streaming pennons at once dissipated the hope: there was not a lance in the American army. They could not be 'rangers.'

Comanches on the war-trail would have been armed with the lance, but clearly they were not Comanches.

'Wagh!' exclaimed Rube, after eyeing them intently. 'Ef thur Injuns, I'm a nigger! Ef thur Injuns, they've got beards an sombrayras, an thet ain't Injun sign nohow. No!' he added, raising his voice, 'thur a gang o' yellur-bellied Mexikins! thet's what they ur.'

All three of us had arrived simultaneously at the same conviction. The horsemen were Mexicans.

It was no great source of rejoicing to know this; and the knowledge produced no change in our defensive attitude. We well knew that a band of Mexicans, armed as these were, could not be other than a hostile party, and bitter too in their hostility. For several weeks past, the *petite guerre* had been waged with dire vengeance. The neutral ground had been the scene of reprisals, and terrible retaliations. On one side, wagon-trains had been attacked and captured, harmless teamsters murdered, or mutilated whilst still alive. I saw one with his arms cut off by the elbow-joints, his heart taken out, and thrust between his teeth! He was dead; but another whom I saw still lived, with the cross deeply gashed upon his breast, upon his brow, on the soles of his feet, and the palms of his hands—a horrid spectacle to look upon!

On the other side, ranchos were ransacked and ruined, villages given to the flames, and men on mere suspicion shot down upon the spot or hanged upon the nearest tree! Such a character had the war assumed; and under these circumstances, we knew that the approaching horsemen were our deadly foes.

Beyond a doubt, it was either a scouting-party of Mexican lancers, a *guerrilla*, or a band of robbers. During the war, the two last were nearly synonymous, and the first not unfrequently partook of the character of both.

One thing that puzzled us—what could any of the

three be doing in that quarter? The neutral ground—the scene of *guerrilla* operations—lay between the two armies; and we were now far remote from it; in fact, altogether away from the settlements. What could have brought lancers, guerrilleros, or robbers, out upon the plains? There was no game in that quarter for any of these gentry—neither an American force to be attacked, nor a traveller to be plundered! My own troop was the out-picket in this direction, and it was full ten miles off. The only thing likely to be met with near the mesa was a war-party of Comanches, and we knew the Mexicans well enough to be convinced that, whether soldiers or freebooters, they were not in search of that.

Such reflections, made in double-quick time, occurred to us as we scanned the advancing troop.

Up to this moment, they had ridden directly towards us, and were now nearly in a line between us and the mesa. On getting within about half a mile of our position, they turned sharply toward the west, and rode as if to make round to our rear! This manoeuvre of course placed us upon their flank; and now, outlined against the sky, we could distinctly trace their forms and note their habiliments and armour. Nearly all wore broad-brimmed sombreros, with jacket, sash, and calzoneros. They carried lances, lazoos, and carbines or *escopettes*. We could distinguish sabres and *machetes*—the universal weapon of the Mexican ranchero. They could not be drilled troops. Their costumes, as well as a certain irregularity in their manoeuvring, forbade this supposition. Their lances, moreover, were borne in all sorts of ways—some couched, some resting in the stirrup and held correctly, while others were carried over the shoulder like a firelock! No, they could not be a troop of regulars. They were either *guerrilleros* or true *salteadores*.

After riding nearly a half-circle round—still keeping at the same distance—the troop suddenly made front towards us, and halted.

We had been puzzled by their going round; we could not divine their object in so doing. It could not be to cut off our retreat. The timber in the back direction was miles off. Had it been near enough, we should certainly have retreated to it long before; but we knew it was too distant. Rube and his old mare would have been overtaken by our well-mounted enemies, long ere we could have gained the woods; we knew this, and therefore did not think of making the attempt. On the other side was the mesa, which, by their late movement, had been left open to us. It was but a half-mile off, and perhaps, by making a dash, we might have reached it; but not a tree grew near it—except those on its summit—and its rocky wall apparently offered no advantage to us, any more than the open plain. The enemy seemed to be aware of this, else they would not have ridden round, and thus left the way clear.

Until the moment of their halt, therefore, we remained ignorant of their motive in moving to our rear; then it was explained. Their object was evident to all of us: they had halted between us and the sun!

It was a cunning manoeuvre, worthy of a war-party of Indians, and told us we had no common enemy to deal with. By approaching us from that direction, they would have a decided advantage: our aim would be spoiled by the sun—now low down upon the horizon, and gleaming right in our eyes. My companions were wroth at the trick that had been thus played so adroitly; though we could not have hindered it even if forewarned.

We were allowed but little time to reflect upon the matter; we saw by the movements of the horsemen that they were preparing to charge. One who appeared to be the leader, mounted upon a larger horse than any of the rest, was addressing them. He rode along the line speaking in a loud tone, and gesticulating

violently; he was answered with *vivas*, which we could plainly hear. Every moment, we looked to see them gallop forward.

We knew there was no alternative but fight or surrender, though not one of us entertained an idea of the latter; for myself, I should as soon have thought of turning my pistol to my own head. My uniform, tattered as it was, would easily reveal my character to the enemy; and, if captured, I knew I should be hung, or perhaps, in the absence of trees, shot down upon the spot. My comrades had reasons for knowing that *their* shrift would be equally short: neither thought for a moment of tamely yielding.

'No!' emphatically pronounced Rube, 'this child don't giv in, till he's rubbed out, he don't! Tarnation odds too!' he added, looking toward the troop; 'twelve agin three o' us. Durn the odds! I've got clur o' wuss scrapes than 't looks yit, and so've you, Bill Garey—hain't we, boyee? Durn the odds! let 'em kum on!'

'Ay,' responded Garey, without the slightest show of excitement, 'they'd better not come too near 'thout tellin thar business. I see one saddle that I'll empy the minnit they pass you weed.' And the speaker indicated a bunch of the *artemisia* plant that grew some two hundred paces off in the direction of the horsemen.

The reckless talk of the old trapper, with the contrasted cool bearing of his younger companion, had fixed my nerves fully. At the first sight of so many adversaries, I was not without some misgivings—in fact, I felt fear. Such odds against us—four to one—was fair cause for apprehension. But it was not my first fight against large odds, both Indian and Mexican; and on that account, I regarded it the less seriously.

Notwithstanding the superiority of our enemy in numbers, I knew we were not so unequal. Unless shot down by the first volley of their carbines and scoppettes, each of our three rifles was sure of its man. I had confidence in my own weapon, and a still more perfect reliance on those of my comrades. They were men that never missed—men who never fired a random shot—never drew trigger till their aim was sure. I felt certain, therefore, that should the horsemen charge upon us, only *nine* of the twelve would ever come within pistol-shot, and for that distance we were well prepared. I carried in my belt a six-chambered revolver, one of Colt's best; Garey had another—a present I had made him many years before—and Rube was armed with a pair of stout single barrels, like enough to do good service.

'Seventeen shots! wi' our bowies to fall back upon!' cried Garey triumphantly, as we finished a hasty survey of our arms.

As yet the enemy did not advance; notwithstanding their *vivas* and ejaculations, they appeared to hesitate about charging. Their leader, and another—a lieutenant, perhaps—were still seen riding along their line, as if animating them by further speech, and giving them orders how to act.

Meanwhile, we had not been idle; we had *formed square* to receive the charge! You may smile, but such was in reality the case. We had formed square—with our horses! There were four of them, for the wild horse counted one. Garey, who rode like a Comanche, had broken him at our last camp, and he was now perfectly tractable. The shake of a lazo rendered him docile as a lamb.

The four were tied head to head, and croup to croup, and each formed one side of the square. They could not have broken it even under a charge of cavalry; bridles must be untied or cut, and lazoes set loose, before that *formation* could be destroyed!

Within stood we, fronting our foes—the large horse of Garey forming our barricade—our heads and feet alone visible to the enemy.

Thus did we await their onsets.

CHAPTER XXXI.

THE PARLEY.

Another chorus of *vivas* announced that the guerrilla chief had finished his oration, and that the attack was about to be made. We saw him, with one or two others, advance in front of the line, and head towards us, evidently intending to lead the charge.

'Now!' muttered Rube, in a sharp quick tone, 'guns ready, boys! no waste shots, d' yur hear? Lead counts hyur—it do. See! By the jumpin Geehosopha, thur a waine to ride right down! Let 'em kum on, and be —! Thur's one o' 'em won't git this fur—I mout say two—I mout say three i'deed. Durn the glint o' thet sun! Billes!' he continued, addressing Garey, 'ee'll shoot fust; yur gun's furrest carry. Plug the big un on the clay-bank hoss. This child's for No. 2 on the gray mustang. An, young fellur! ee'll jest pick off thet niggur on the roan. I know yur wild-cat to the bone, but keep yur eye skinned an yur naves steady, d' yur hear?'

'Yes, yes!' I hurriedly answered, though at the time steadiness of nerves was easier promised than practised. My heart was heaving in quick pulsations at the near prospect of the terrible drama about to be enacted.

At this moment the 'Forward' fell upon our ears, and with the wild notes of the bugle came the words:

'*Andela! anda! Dios y Guadalupe!*'

In an instant, the troop was in motion, and pressed forward, galloping to the charge.

They had not made many stretches before their line became broken, several of the swiftest or most courageous forging ahead of the others.

'The three fo'most!' cried Rube, in the same sharp tone—'the three fo'most! Thet'll fotch 'em up wi' a roun turn, or this child's mistaken. Now, boyees! mind yur eyes! Steady! Stea-dy—stea-dy!'

All at once, Rube's muttered cautions, slowly drawled out, were changed to an exclamation that betokened surprise, followed by a long low whistle of the same import! The cause was clear. The guerrilleros had got within three hundred yards of us, still going at a gallop, but we could perceive that their pace slackened as they advanced; already it was more of an amble, than the forward dash of an earnest charge. It was evident they had no stomach for the business—now that they were near enough to see the shining barrels and black hollow tubes of our levelled rifles.

Garey was waiting till the foremost should pass the *artemisia*-bush; for by that he had long since calculated the point-blank range of his rifle. Another moment, and its crack would have been heard; but the horseman, as if warned by instinct, seemed to divine the exact limit of danger. Before reaching the bush, his heart failed him, and in a wavering, irresolute manner, he drew bridle, and halted! The others, nothing loath, followed his example, until the whole troop had pulled up within less than three hundred yards of the muzzles of our guns!

'Cowed, by —!' shouted Rube with a derisive laugh. 'Hulloo!' continued he, raising his voice still louder, and addressing the halted line: 'what do ee want anyhow?'

Whether Rube's comical interrogatory was understood or not, it elicited a reply:

'*Amigos! somos amigos!*' (We are friends!) shouted back the leader of the band.

'Friends, be durned!' exclaimed the trapper, who knew enough of Spanish to understand the significance of *amigos*. 'Nice friends you! Wag! D' yur think to bamfoozle us thet-away? Keep yur distance now!' continued he, raising his rifle in a threatening manner, as a movement was perceptible among the

horsemen. 'Keep yur distance, or, by the tarnal airthquake! I'll plug the fust o' ye thet rides within reach. Durn sich friends as you!'

The leader now conversed in a low tone with his lieutenant. Some new design seemed to have been devised between them—and after a while, the former again addressed us; speaking as before in Spanish.

'We are friends!' said he: 'we mean you no harm. To prove it, I will order my men to fall back upon the prairie, while my lieutenant, unarmed, will meet one of you on the neutral ground. Surely, you can have no objection to that?'

'And why such an arrangement?' inquired Garey, who spoke Spanish fluently. 'We want nothing of you. What do you want from us, with all this durn'd fuss?'

'I have business with you,' replied the Mexican; 'and you, sir, in particular. I have something to say to you I don't wish others to hear.'

As he said this, the speaker turned his head, and nodded significantly towards his own following. He was candid with them at least.

This unexpected dialogue took all three of us by surprise. What could the man want with Garey? The latter knew nothing of him—had never, as he declared, 'sot eyes on the niggur before;' although at such a distance—with the sun in his face, and the Mexican's sombrero slouched as it was—Garey might be mistaken. It might be some one whom he had met, though he could not recall him to mind.

After a short consultation, we agreed that Garey should accept the proposal. No evil could result from it—none that we could think of. Garey could easily get back, before any attack could be made upon him, and Rube and I should still be ready to protect him with our pieces. If they meditated treachery, we could not perceive the advantage they were to gain from the proceeding.

The 'parley' therefore was accepted, and the conditions arranged with due caution on our part. The horsemen—with the exception of the leader and his lieutenant—were to ride back to the distance of half a mile; the leader was to remain where he was; and half-way between him and us, Garey and the lieutenant were to meet, both of them on foot and unarmed.

At an order from their chief, the guerrilleros fell back. The lieutenant dismounted, laid his lance along the ground, unbuckled his sabre, drew the pistols from his belt, and placing them beside the lance, advanced towards the appointed spot.

Garey had likewise disarmed himself; and leaving his weapons in charge of Rube and myself, stepped forth to meet the Mexican. In another minute, the two stood face to face, and the 'parley' began.

It was of short duration. The speaking, which appeared to be principally done by the Mexican, was carried on in a low tone; and Rube and I saw that he pointed frequently in our direction, as if we were the subject of his discourse! We observed that his harangue was suddenly interrupted by Garey, who, turning round at the same instant, cried out to us in English:

'Hilloo, Rube! what do yer think the skunk wants?'

'How shed I know?' replied Rube. 'What do 'e want?'

'Why, he wants'—Garey's voice rose, louder with indignation—'he wants us to give up the *ranger-captain*; an sez, if we do, you an me can go free. Ha, ha, ha!' and the young trapper ended his announcement with a scornful laugh.

Simultaneous with Garey's laugh, I could hear Rube utter a low whistle, and the words 'thet's how the stick floats;' and, then raising his voice, he called out:

'An what answer hev you gin him, Billee?'

'I hain't answered him yet,' was the prompt reply; 'but hyar's the answer!'

I saw Garey's arm raised, with his huge fist clenched; I saw it descend like a trip-hammer upon the face of the Mexican, who with the blow fell heavily to the earth!

WHY DO I WEAR A HAT?

I AM a reasonable man, and I wish to know—quite out of course it may be, and without having an appointment, but nevertheless I wish to know—'Why I wear a hat.' Having years ago decided in my own mind that I do not wear it for its utility, certainly not for its beauty, and emphatically not from choice, I simply wish to discover, if possible, *why* I wear it. Why am I, a respectable citizen, a devoted husband, a disinterested adviser, and a kind friend—as the world will discover, when it is too late, from my tombstone—why am I condemned during life to this severe penal servitude, and deprived even of the ameliorating condition—in which light I should look upon a wide-awake—of a ticket-of-leave? A ticket-of-leave! Why, if, in the mistaken supposition that I am beyond the immediate influence of Printing-house Square, I perambulate the streets of a continental city in any head-tire less excruciating than this, the *Times* dedicates its leading columns to a denunciation of the atrocity; whilst if, similarly attired, I attempt the streets of our own metropolis, the derisive vulgarity of misguided youth unweariedly pursues me. Why, I ask, on the authority of an independent elector, and one having a stake in the country, why is this?—What is a hat? Apart from its being the gross caricature of an inverted flower-pot, and the most perfect conception of ugliness possible, is it possessed of some subtle and mysterious quality, of which I am unhappily ignorant, but which to the educated eye presents it as an object of beauty and symmetry? Is it—as the universal sympathy of the nineteenth century would almost persuade me—in any way connected with the steam-engine, or the printing-press, or trial by jury, or habeas corpus, or parliamentary reform, or, in fact, the British constitution? Is the wearing of it insisted upon, under the severest penalties, by any particular act of parliament, and, though I know it not, one of the most material constituents of our national prosperity?

Influenced by the prevailing weakness of the age, I should be more reconciled to it could I discover any precedent for the custom, or that it had the sanction of antiquity to recommend it; but I cannot. My ancestors, however preposterous they may have been in the fashion of their boots, however capricious in the cut of their trunk-hose and doublets, or however eccentric in their conceptions of periwig, were never, that I can discover, guilty of wearing anything so monstrous as a modern hat. Even my remote ancestors, the ancient Britons, though particular to a fault in the illustration of their stomachs, and somewhat savage, I must confess, in many respects, were never so lost to everything human as this. I am not even aware that any of our national statues are accommodated with this article of costume.

In the days subsequent to those of my illuminated ancestors, I find that although hats were worn, they were generally of a fanciful and picturesque construction, as witness what Stubbs in the year 1585 says on the subject: 'Sometimes,' he says, 'they use them sharpe on the crowne, peaking up like the spire or shaft of a steeple, standing a quarter of a yarde above the crowne of their hedges, some more, some less, as please the phantasies of their inconstante mindes. Othersome be flatt and broad on the crowne, like the battlements of

house. Another sorte have rounde crownes, sometimes with one kinde of bande, sometimes with another; now black, now white, now russeed, now redde, now green, now yellow, now this, now that, never content with one colour or fashion two daies on end. And as the fashions be rare and strange, so is the stuffe whereof their hattes are made divers also; for some be silke, some of velvet, some of taffetic, some of arset, some of wool, and, which is most curious, some of certaine kinde of fine haire; these they call bever hattes, of xx., xxx., or xl. sh. price.'

Now, so strong are my individual feelings upon the subject, that I conscientiously declare I would rather wear a sarsnet hat a quarter of a yard high, with a yellow riband round it, as my respectable progenitors, at the authority of Stubbs, did 200 years ago, than be attired in the glossiest, lightest, most flexible, and best ventilated gossamer of the present day; and this although I commenced this paper by stating—and I stick to it—that I am a reasonable man! My great-grandfather, who flourished 150 years ago, wore a three-cornered cocked-hat, and looked like a gentleman. If he were to meet the present writer staggering under a head-dress of this period, he would kick him—and very properly—for disgracing the family: as the custom was in his day, he would probably swear at him too!

But putting my immediate ancestors out of the question, can we for a moment imagine anything heroic, anything noble or worthy of historical record, to be associated with the idea of a hat? What would be the fate, for example, of our ideal portrait of the Great Napoleon, as he stands with folded arms on a rocky promontory of his island-prison, gazing over the great Atlantic waste, to where—the theatre of all his glory, the centre of all his fading hopes—'La Belle France,' lies far away, and lost to him, in the distance? What would become of this portrait, I say, were a modern artist substituted for the immortal *chapeau* of that immortal man? Simply and fatally, that, by virtue of the change, we should recognise in the person of the great commander, a possible Smith, a probable Brown, a hypothetical Jones, a supposititious Robinson, brooding, it might be, over the flatness of cotton, or the tightness of the money-market.

Let the most enthusiastic admirer of Cromwell once place a hat upon the head of that remarkable man, and he becomes a huge, fat, vulgar, frouzy brewer instantly. So deeply am I impressed with the terrible effects arising from this article of dress, that I fear the rapid expanse of forehead, the colossal brow of the immortal Shakespeare himself, would not be proof against so vile a covering—so terrible a leveller is a hat.

That the fact of its existence would have altered the current of history in the case of the tyrant Gessler, so that the toxophilistic proficiency of William Tell would have been known only to his friends, I have little doubt, so utterly absurd would it have been to anticipate obedience to a—hat!

If it be true that no man can be a hero to his valet, how infinitely more certain is it that no man can be a hero in a hat!

But I feel that it is quite impossible to furnish even the most concise epitome of my hatred to hats within the limits of a column. If I ever do—and I confess I sometimes do—yearn for the faculty of authorship, it is primarily that I may devote three volumes of the most brilliant writing to a denunciation of this most atrocious slavery, so that my name may go down to posterity—in conjunction with that of Mrs Harriet Beecher Stowe—as one of the greatest reformers of my age.

Pending the publication of this—I may say prophetically—celebrated work, I will, for present purposes, call upon all true-hearted Britons, as they value liberty, and never, never, never will be slaves, to shake off this

vile yoke, and assert their native dignity—in night-caps, if necessary—or, as the only alternative, to furnish me with a satisfactory reason *why* I wear a hat.

THE MONTH:

SCIENCE AND ARTS.

THE first month of the new year has been marked by a fair amount of activity: publishers of good books say they 'mustn't complain'; philosophers are all but unanimous in thinking they have made a good start; and artists are worked up to different degrees of enthusiasm by the exhibition—at last—of some of Turner's pictures in Marlborough House, and by the fact, that government is building a gallery to receive the valuable collection of paintings offered to the nation by Mr Sheepshanks. This gallery forms part of the erections in which the Department of Science and Art is now lodged at South Kensington, with space enough for museums and offices, and all the appliances needful for its national task—art-education. While in these respects the department is acknowledged to be effective, opinions are very much at variance as to its locality—one party declares it to be too far west; another maintains that fifty years hence it will be central. At anyrate, it is too far west at present to be used as a means of study and reference by working-people, most of whom dwell in the east, and would naturally be unwilling to lose half their day in the walk from Spitalfields to Kensington and back. Meanwhile the tendency to migrate westward appears to grow stronger. The Royal Society are busy removing their library from the Strand to Burlington House; a commission is considering the question as to site for a new National Gallery; and everything foretokens that the east will be left still further behind than at present.

The Privy Council of Education are about to establish a museum in the same quarter for educational purposes. It will comprise the several objects and materials exhibited by the Society of Arts in St Martin's Hall in 1854, with plans and models of schools, of fittings and apparatus, desks, seats, books, &c., &c. This is a most praiseworthy project, and we hope it will be properly appreciated and resorted to by those engaged in the work of education in all parts of the kingdom.—We have satisfactory information from Woolwich as to what can be done by real study and honest examinations: the officers of engineers who obtained their commissions by passing their examination successfully, though looked coldly on at first as interlopers, and regarded as 'persons,' have proved themselves remarkably apt and able in their duties, and in their persevering endeavours to master all the details. Some have already suggested improvements in engineering appliances; and there seems good reason to believe, that henceforth officers thoroughly acquainted with their profession will be the rule, and not the exception.—And attention has been called to the fact, that in knowledge of another sort—namely, of living Eastern languages—England is more backward than she ought to be; and measures are to be taken to insure that our military and civil officers, from Constantinople to Canton, shall be able to confer with the natives without the medium—too often a fatal one—of an interpreter. In the present state of affairs in Persia and China, this question becomes of much importance.—A proposal has been made which promises well for another sort of education: to establish Industrial Schools, each of which shall comprise a 'training family'—girls to be entered and instructed, during good-behaviour, in all that appertains to domestic economy and household duties. Will it not be a surprise if we have troops of young women skilled in the neglected accomplishments of roasting mutton, boiling potatoes, and making a shirt!

The Society of Arts announce that their Ninth Exhibition of Inventions will open on the 23d of March: another opportunity for the usefully ingenious to demonstrate their capabilities. Among the papers read at the evening meetings of the society, one on the Natural Resources of British Honduras by the colonial Chief-justice Temple, made known many new particulars concerning the colony as to climate and productions, from which we gather that scarcity of mahogany is not to be feared for a long time to come.

Talking about Honduras reminds us of a new yam, as it is called, which has been sent from Mexico to the Académie at Paris. It is of prodigious size—2 mètres 51 centimètres long, 89 centimètres circumference, and weighs 86 kilogrammes. Some of the academicians say it is rather a rhizome than a root; not a yam, but a hitherto undetermined vegetable, perhaps a *dioscorea*—a question to be settled by botanists. In Mexico, as we are informed, it is not at all uncommon for the roots to grow to a length of four mètres. They are a palatable article of food, notwithstanding their size.

Mr Palliser's project for exploring the Saskatchewan and the passes of the Rocky Mountains, is recommended by the Geographical Society. If we are to purge our towns and counties of rogues and desperadoes by transporting them to Vancouver's Island, a practicable route across the continent of America to the north-west becomes a desideratum. And among the subjects brought forward at recent meetings of the Society are—the desirability of constructing a railway from the north-west coast to Hudson's Bay—a scheme for an exploration of the Orinoco, and on the progress of the North Australian exploring expedition. The last published volume of the Society's *Journal* contains numerous interesting papers: Markham, On the Sources of the Purus; Cadell, On the Navigation of the Murray; Bollaert, On Coal in Chile, &c. And as regards Africa, Dr Livingstone's discoveries are to be followed up, and another expedition is to be sent to penetrate the interior up the Quorra and Tchadda. Apropos of Dr Livingstone: Edinburgh acknowledges his merits by conferring on him the freedom of the city; Glasgow has offered this honour; and in London a testimonial, set on foot by an animated public meeting at the Mansion-house, is growing into a solid subscription. In a testimonial so well deserved, all classes may cheerfully unite.

The Hakluyt Society are continuing their useful publications, chiefly of early voyages and travels never before published, reprints of old editions; and in this way a series of works, hitherto inaccessible, is brought within reach of the scientific reader. *Russia at the Close of the Sixteenth Century* is the title of the last; and among volumes forthcoming we find, *India in the Fifteenth Century*, and, translated by Admiral Smyth, *The Travels of Girolamo Benzoni, in America, in 1542-56*. A subscription of a guinea a year entitles the members to all the works published.—Notice has at times been taken of specimens of graphic or hieroglyphic writing brought from Mexico, of a date subsequent to the Spanish conquest: Mr Squier has read a paper thereupon before the Royal Society of Literature, in which he shews that these specimens are writings prepared by the earliest Spanish missionaries to impart a knowledge of the Christian faith to the Mexicans.—And while on the subject of books, we may mention here a work in two volumes, published at Paris by M. E. Bonnemère—*Histoire des Paysans*, in which the author, tracing the history of the peasantry, shews how the growth of political liberty has gradually ameliorated their condition, and how certain remarkable epochs form, as it were, a measure of their advance. The period embraced is from 1200 to 1850; but in the introduction, the history is carried back to the fiftieth year before the present era.

Since the publication of Professor J. D. Forber's theory of the phenomena of glaciers, a notion had prevailed that the question was settled; but Messrs Tyndall and Huxley, in a paper read before the Royal Society, illustrated by ingenious experiments, make it evident that there is much to be said on the question from another point of view. Demurring to the viscous theory of glacier motion, they shew that the same effects are producible by another and a different cause—a mechanical one. The operation of this is favoured by a certain plasticity of the ice, by reason of which it takes readily new forms under great pressure, as was demonstrated by experiment. A sphere of ice was compressed into a perfect lens; a small flat slab into a half-circle; and from a hemispherical mass, a complete basin was produced—all retaining their shape solid enough to be freely handled, till they melted away in the warmth of the room. Dr Tyndall was led to the views, here sketched in merest outline, by his researches into the origin of slaty cleavage; and having confirmed them by a visit to the Alps of Switzerland and the Tyrol, he has, conjointly with Mr Huxley, submitted them to the judgment of scientific men in the way above mentioned, and by a lecture delivered at the Royal Institution.

A paper 'On Some of the Products of the Destructive Distillation of Boghead Coal,' by Mr Williams of Glasgow, read also before the Royal Society, is interesting as affording another instance of the advantages derived by industry from refined science. The products in the present case are numerous, and such as will become available in the useful arts, similarly with benzole, paraffine, &c. After the reading of the paper, the president of the Chemical Society mentioned, as an example of the progress made in researches of the kind under notice, that aniline—a compound of the benzole series—which a short time since could only be obtained in what was considered a large quantity—a few ounces at a time—is now obtained at the rate of thirty-five gallons a day, and used in the dyeing of silk. New applications of benzole are also discovered, some of them available in domestic economy. It is preferable, as we hear, to turpentine for cleansing silk and woollen from spots of grease.

We noticed in a recent *Month*, improvements in the manufacture of sugar on the great beet-root farms in Picardy, and we now call attention to the operations carried on at Messrs Dray & Co.'s beet-root farm at Farningham, near Dartford, Kent. Large quantities of the root are grown, subjected to distillation, and afterwards used to fatten sheep and cattle. To three-quarters of a ton of beets, which are sliced lengthwise by machinery in an hour, 800 gallons of wort prepared by maceration of beets to start with, are poured on, a quart of sulphuric acid is added, and at the end of twenty-four hours, the slices are ready for distillation. Placed in iron cylinders divided into compartments, each compartment is drawn upon successively, so that there is a continuous flow of spirit until the end of the process. The spirit is said to resemble small-still whisky; and under proper treatment, becomes what is called a neutral spirit, useful for many industrial purposes. So much success has attended the manufacture of beet-root spirit in the district around St Quentin and Valenciennes, that 17,000 bullocks and 140,000 sheep are now fattened annually, where the number used to be 11,000 of the one and 70,000 of the other; and more corn is grown because of the increased supply of manure. It remains to be seen whether the like prosperity will attend the endeavours in Kent.

There is talk of a limited liability company to work Dr Normandy's patent process for distilling fresh aerated water from sea-water; to be applied, we presume, in places where natural fresh water is not to be had. The efficiency of the process was tested at

Heligoland, as government had an apparatus fixed to supply the German Legion when camped on the islet.—A communication addressed to the Académie at Paris shews oxygenated water to have a remarkable curative effect in cases of cholera—a fact said to be confirmatory of the evidence that absence of ozone from the atmosphere is a cause of cholera. The oxygenated water makes up the deficiency.—Messrs Schroeder and Dusch make it apparent that meat may be kept fresh for a long time in filtered air. The filtration is effected by very simple means—namely, panels of cotton wadding to the safe or closet in which the meat is hung. Would not this method of delaying putrefaction come within the conditions prescribed by the Society of Arts in their last prize-list? Butchers' meat has risen to so extremely high a price in Paris, that there has been some talk of the imperial government undertaking to sell preserved fresh meat at a reasonable rate.

The inquiry for fibrous and oil-producing plants for manufacturing purposes, continues: Chief-justice Temple says we are as yet very imperfectly acquainted with the oleaginous products of Honduras, and Dr Royle repeats his testimony in favour of India as an exhaustless field of vegetable fibre. This leads us to notice an improvement in the flax-trade—Macbride's scutching-machine—which cleans more than 500 pounds of fibre in ten hours, and when driven to the utmost, will turn out 900 pounds in the same space of time. Compared with hand-labour, there is a gain of more than half in favour of the machine—at least, so say the initiated.—The United States government is sending an expedition to different places within the tropics to collect cuttings of sugar-cane, to renew the exhausted stocks in the southern states.—A bronze halfpenny, the first coinage in that metal, has just been struck for circulation in Nova Scotia.—Austria is about to send out her first naval exploring expedition round the world: Dr Scherzer of Vienna to be chief naturalist.—Clifford's plan of lowering boats from ships under-way, or steamers at full speed, continues to bear the severest tests; as shewn by a recent trial, in presence of the port-admiral and other authorities, at Portsmouth, it is equally available with a light skiff or a heavy boat. It is a mechanical contrivance which every ship-owner should at once adopt.—An American invention, patented by Mr Reader, has been submitted to the Admiralty and the leading scientific societies. It is a 'Mariner's Time Compass,' which he describes as 'a combination of a universal dial and chronometer, constructed to take any horizontal bearing in any latitude, at any hour of the day. It is also intended to solve practically those problems which can be solved by an armillary sphere, or by spherical trigonometry—and to supply the place of the magnetic needle.' To describe the instrument without a diagram, would not be easy; in few words, it has a brass ring, a dial and compass working on gimbals; and wire standards which throw a shadow. 'For taking a horizontal bearing in any latitude,' says Mr Reader, 'let the hour be what it may, it is only necessary to bring the hand, with its two upright wire-standards, to the true apparent time: the instrument then being turned till the hand points to the sun, gives the course. This hand is provided with a lens fixed in the centre, which takes the place of the gnomon of the universal dial, and is carried round by the chronometer once in twenty-four hours—the focus from which being thrown on the equatorial circle, gives the true time.' The instrument will also shew the apparent time—the altitude and latitude—the course and longitude by night when the moon is visible or the planets—and by proper adjustment, the figures 12 and 12 on the dial may be made to stand true north and south, and thus shew the error or variation of the compass-needle. Although these particulars will

be best understood by mariners, we are glad to assist in making generally known an instrument which is likely to be of real use in navigation. It has been tried in the Collins line of mail-steamers and on board other vessels with favourable results.

M. Porro, whose name we have more than once mentioned in connection with physical science, has invented a telescope which is as compact and portable as an eye-glass, and is found to be admirably adapted for cavalry officers and others who have to reconnoitre the distance from horseback. It consists of three prisms, of which one forms the object-glass, the second the eye-piece, and the third gives the image its true position. The cost is somewhat high, 150 francs, which is occasioned by the fact, that if the prisms are out of plane by ever so small an amount, they have to be rejected.—Dr Bagot, thinking it of importance that more should be known of what goes on in the upper strata of the atmosphere, has exhibited to the Royal Dublin Society an instrument which he calls a nepheloscope for measuring the movement of the highest clouds.—A patent has been taken out to render wood fire-proof: the process is to steep the planks in a solution of phosphate of ammonia, and subject them afterwards to heat.—The Damascus Steel Manufacturing Company have patented a method for converting wrought iron into cast steel.—A remarkable discovery of iron ore has been made at Seend, Wiltshire, near the borders of the New Forest. It is a ferruginous sandstone, containing in some instances fifty per cent. of iron. Already, about 5000 tons have been dug out, and sent to Wales to be smelted.

Mr Mayall's new material for photographic pictures, noticed some time ago, appears now to be improved to as near perfection as may well be. The glare of a metallic plate is objectionable in photography, and paper, though free from glare, is also objectionable from its absorption of the middle tints, owing to its fibrous nature. By a combination of sulphate of barytes with albumen, Mr Mayall produces a substance resembling ivory, which gives the surface required, and capability of finish. On this, middle tints and distances come out in perfection, and a portrait can be made ready in a couple of days. The progress made in photography during the past twelvemonth may be seen to admiration in the Photographic Society's Exhibition now open in Fall Mall.

We may just mention here a case of poisoning in food, the publicity of which may do some service. It occurred near Edinburgh in 1856—the great poisoning year—and we see it stated at length in the *Edinburgh Medical Journal* for May. The case we refer to is that of Mr H. Stephens, author of the well-known work, the *Book of the Farm*. One day in March, Mr Stephens ate for his dinner a broiled American partridge, which had been purchased from a poulterer. This bird, though called a partridge, resembles a grouse, and is the ruffed grouse of the United States (*Bonasia Umbellus*). Shortly after dinner, Mr Stephens felt exceedingly uneasy; it seemed as if his whole person was under an oppressive weight. This was followed by loss of sight, and a sensation of intense cold. Then he felt an inclination to vomit, and immediately afterwards dropped almost senseless on the floor. A medical practitioner who was sent for, pronounced Mr Stephens to be poisoned; and to restore action to the feeble system, administered brandy. Some repeated doses of warm water and brandy produced vomiting. Put to bed, Mr Stephens was kept warm by hot-water bottles and other means. Next day, he began to recover, and finally got well. On examination, it was found that the partridge, as is not uncommon with this imported American bird, was in a poisonous condition. The animal is believed to feed on plants of a deleterious kind; and if kept long, the poison from the food in the crop permeates the flesh.

GREEK, ROMAN, AND NEGRO LONGEVITY.

Zeno is stated to have lived 102 years; Democritus, 104; Pyrrho, 90; Diogenes, 90; Hippocrates, 99; Plato, 82; Isocrates, 98; Gorgias, the master of Isocrates, 107. But for the cup of hemlock, and the sword of the Roman soldier, the 70 years of Socrates, and the 75 years of Archimedes, might well have reached the same high class of longevities. The old age of Sophocles, 90 years, is associated with the touching anecdote of his recitation of verses from the *Oedipus Coloneus*, in proof of his then sanity of mind. The lofty lyric genius of Pindar was not lost to his country until he had reached 84 years. Simonides wore his elegiac laurels to the age of 90. . . . The census instituted by Vespasian furnishes some results as to longevity singular enough to suggest doubts of their entire accuracy. The instances given by Pliny are taken exclusively from the region between the Apennines and the Po; and upon the record of this census—which he himself calls *res confessa*—he enumerates 54 persons who had reached the age of 100, 14 of 110 years, 2 of 125, 4 of 130, 4 of 135, and 3 of 140 years. In the single town of Valcutium, near Placentia, he mentions 6 persons of 110, 4 of 120, 1 of 150 years. These round numbers are somewhat suspicious as to the reality of the ages in question; and the whole statement, derived from a district by no means noted for its salubrity, is so much in excess of any similar record in other countries, that we cannot but hesitate in admitting it. . . . In 1840, when the population of the United States was about 17 millions, of which 2½ millions in round numbers were negroes, the census gave 791 as the number of whites above 100; while of slaves, the number of those above 100 is registered as 1333, of free negroes, as 647. In 1855, we find from the census, that 43 persons died in the United States above 100; the oldest white male at 110, the oldest white female, 109; the oldest negro man, 130, the oldest negro woman, 120, both slaves. From Professor Tucker's analysis of the American census from 1790 to 1840, published a year ago, we derive the strange result, if true, that the chances of living above 100 are 13 times as great among slaves, and 40 times as great in free negroes, as in the white population of the country.—*Edin. Review*.

THE VICTORIA BRIDGE.

This bridge, which we need hardly say crosses the St Lawrence a short way above Montreal, will be one of the grand wonders of the wonders of the world. It was commenced in July 1854, and is under contract to be completed in 1860. The total estimated cost was originally about 7,000,000 dollars; but recently the plans have been amended so as to reduce it to a little over 6,000,000 dollars. The extreme length of the bridge, including the abutment at each side, will be 7000 feet, or rather more than a mile and a quarter. There will be twenty-six piers of solid masonry supporting the iron superstructure of the bridge. The centre span will be 350 feet, and the other spans each 242 feet wide. The height of the centre of the bridge is to be 60 feet above the level of the water. The weight of iron in the tubes will be 8000 tons, and the contents of the masonry, 30,000,000 cubic feet, when the whole structure is finished. The famous Britannia Tubular Suspension Bridge crossing the Menai Strait, and now one of the curiosities of the world, will scarcely be a circumstance to it. Including the embankments at each side, the total length of the bridge from river bank to river bank will be 10,274 feet, or nearly two miles. The abutment of the bridge at which the landing from the steamers was made, is nearly completed. It consists of an immense mass of masonry, of such apparent strength as to strike the beholder with the impression that it is capable of resisting any possible amount of pressure by the heavy piles of ice that come down the St Lawrence. Experience alone, however, can fully test its capabilities in this respect. Nine piers of the bridge are now completed, but as yet unconnected by any roadway. They present a plain surface on the two sides and lower end; the side facing the current being of a wedge shape, in order to break and turn aside the blocks of ice, to provide against whose destructive power has been the great engineering difficulty of the enterprise.—*Newspaper Correspondent*.

THE ANGELS.

PARAPHRASED FROM THE GERMAN.

Now list while I tell thee, my darling child,
How lovely and fair are the angels mild!
They have radiant faces more purely bright
Than the heavens and earth in soft spring light;
They have eyes so blue, and serenely fair,
And eternal flowers in their golden hair,
And their flashing wings which to thee would seem
Of silvery moonshine, a dazzling beam,
The angels wave so stately and light,
From rosy morn till the dewy night.

Now list while I tell thee, my darling child,
How softly and light soar the angels mild!
As lightly as flutters from heaven the snow,
As soft as o'er earth the pale moonbeams glow,
As light as the mist in silver wreath curls,
As soft as the bud into blossom unfurls,
As lightly as leaflet is borne from the tree,
As soft as the lightfall o'er land and o'er sea,
Thus lightly and softly, my darling child,
On pinion of air soar the angels mild!

Now list while I tell thee, my darling child,
Where dwell the angels so lovely and mild!
Where the voice of the poor is heard in need,
There haste the angels with manna to feed;
Where o'er her sick babe the young mother weeps,
Bright angels flock nigh, and the little one sleeps;
Where the worn and weary faint and fear,
Where trembles a soul, where falls a tear,
There swiftly speed, my darling child,
On ministering wing the angels mild!

And wouldst thou, my child, the angels view?
That on this earth thou canst not do;
But if holy and pure thou livest here,
A beauteous angel will ever be near;
And in that hour when realms of light
Refulgent, dawn o'er the dimming sight,
Thou'lt see them then, as they beckon aloft,
Expand thy budding wings so soft!
And lo! in Elysium, my darling child,
Thou wilt be triumphant an angel mild! L. M.

RUSKIN TURNETH ROUND ON TURNER.

The moment he tried to idealise, and introduced principles for the sake of display, they led him into error proportioned exactly to the extent of effort. painting, at this period, of an English town, or a Whig hill, was magnificent and faultless; but all his ideal mythology, romance, and composition in general, were more or less wrong. He erred through all, and by reason of all—his great discoveries. He erred in colour; because, not content with discerning the brilliancy of nature, he tried to enhance that brilliancy by every species of colour accessory, until colour was killed by colour, and the blue skies and snowy mountains, which would have been loved by themselves, were confused and vulgarised by the red dresses and white complexions of the foreground figures. He erred in refinement, because, not content with the natural tenderness of tender things, he strove to idealise the strongest things into gentleness, until his architecture became transparent, and his ground ghostly; and he erred finally, and chiefly, in quantity, because, in his enthusiastic conception of the fulness of nature, he did not allow for the narrowness of the human heart; he saw, indeed, that there were no limits to creation, but forgot that there were limits to reception: he thus spoiled his most careful works by very richness of invention they contained, and concentrated the materials of twenty noble pictures into a single failure.—*Ruskin's Notes on the Turner Gallery at Marlborough House*.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 166.

SATURDAY, MARCH 7, 1857.

PRICE 1½d.

RELIGION, LOVE, AND MARRIAGE IN ITALY.

ONE day so closely resembles another in the general course of existence in the provincial towns of Central and Southern Italy, that it would be difficult, with any regard to truth, to throw much more diversity into the description of twelve months than of twelve hours; the only variation of any importance being connected with the seasons when the Opera is open, for which the majority of the population retain the absorbing attachment that grave thinkers, like the good and enlightened Ganganelli, so far back as a century ago, lamented as the bane of the inhabitants of the Marche. On this, however, as on a variety of other matters, his successors held different opinions down to Clement XIV.; and by their encouragement to the taste for theatrical performances, fostered the levity which that pontiff in his correspondence so much deplores—well content to see the eagerness, the interest, the hopes which in other countries men are *taught* it is more fitting to bestow on questions of science, politics, and religion, centre among their own subjects on the *villi* of a prima donna, or the legs of a *ballerina*.

That which, perhaps, out of a hundred other traits, most forcibly attracted my notice, as evincing the most striking contrast to English manners—for be it remembered, I never set up for a cosmopolite, but, conscious of my inherent insularities, measure everything by the gauge of English opinion and English custom—was the complete absence, in their familiar conversation, of all allusion to a topic which, more or less, for better or for worse, is always a predominant one with us.

It was some time before I could assure myself that the silence connected with religion, in all save its most material forms—such as just saying: 'I am going to mass'; or, 'How tiresome! to-morrow is a vigil, and we must eat *maigre*!'—did not arise from reserve at the presence of a heretic; but at length I was convinced that there was no design in this avoidance of topics which, in England, you can scarcely take up a magazine, or a fashionable novel, or pay a morning visit, or go twenty miles in a railway, without encountering. Instead of interweaving their conversation with phrases akin to those which, either from piety, habit, or, alas! from cant, are so frequently upon the lips of English people, the Italians seemed anxious to shut aside whatever tended to awaken such unpleasant considerations as the uncertainty of life or a preparation for eternity; casting all their cares in this last particular—when they considered it worth caring for—into the hands of priests, with a confidence it was marvellous to witness.

Never, certainly, judging them as a totality, was there a set of people who 'thought less about thinking, or felt less about feeling;' who went through life less troubled with self-questionings of what they lived for, or whether they lived well; or who, dissatisfied and listless as they might be in their present condition, manifested less inclination to dwell upon the hopes and prospects of futurity. Yet, although thus opposed to any serious reference to sacred things, they resemble the French in the levity with which they will introduce them on the most unseasonable occasions, without any apparent consciousness of impropriety. Nay, there was thought to be nothing profane in a *tableau-vivant*, which I heard them talking of, as having recently taken place at the house of one of the noble ladies of the society; the subject—a Descent from the Cross, or the Entombment, I know not which—impersonated from an ancient picture. Suffice it to say, that our Saviour was represented by a remarkably handsome young student from Bologna, whose style of features and long brown hair resembled the type which all painters have more or less followed in their pictures of Christ; and that the Magdalen was the lady of the house, a Florentine contessa, whose Rubens-like colouring and billowy golden hair had first suggested her fitness to sustain a part, for which her detractors, of course, added she was also in other respects well qualified.

The sentiments I expressed at this exhibition evidently caused surprise, as, in fact, was invariably the case at the manifestation of any religious tendency on my part. I think I have before mentioned that Protestant amongst these worthy people was but a polite term for Atheist; as in the case of the Marchesa Silvia, when I offered her one of our prayer-books, the superstitious shrink from being enlightened upon our tenets; while to the unbelieving, they are a matter of profound indifference, respecting which they never dream of asking information. And under these two heads, with but rare exceptions, and a vast and increasing preponderance to the side of infidelity, it is no want of charity to say that the population of the Pontifical States may be classified.

Second only to the avoidance of all serious subjects, that which most struck me was their complete indifference to literature, even in its simplest form. Unknown to them is the veneration we cherish for the popular authors of the day, our familiar reference to their works, our adoption of their sayings. During childhood, they have no story-books to fill their minds with images which, converted into pleasant memories in advancing life, it is like letting sunshine upon the soul to muse over. Their ripening years see them

with the same void; for, however it may be objected that a nation possessing Dante and Tasso, Filicaja and Alfieri, Monti and Leopardi, should never be taxed with the barrenness of its literature, I reply that I am here speaking of the requirements of the generality of the masses, for whose capacity such authors range too high. The only attempts to supply this deficiency which the present time has witnessed, or rather, it should be said, the jealous surveillance over the press has permitted, have been half-a-dozen historical novels from the pens of Azeglio, Manzoni, Guerrazzi, and one or two others. But as yet the experiment has failed: you may say of the Italians as of a backward child, 'they do not love their book!' Reading is looked upon as inseparable from study; as a monopoly in the hands of a gifted few; and the most hopeless part of the case is, that they are not sensible of their deficiency, nor lament the deprivation! Were scores of what we consider unexceptionable works for youth, to be spread before Italian parents and preceptors—tales, travels, and biographies—they would not bid the rising generation fall to and read. 'Let them alone,' they would say; 'the boys must attend to their education: reading for mere amusement will distract their thoughts.' As for girls, the refusal would be still more decided, for they could be expected to gather only pernicious notions about seeing the world, or independence, or choosing for themselves in marriage, from the perusal!

I talked this over one day, not long before my return to Ancona, with the Marchesa Gentilina, who was sufficiently free from prejudice to listen quietly to some of my remarks, and sometimes even to acquiesce in their justice. But on this last point she was not amenable to my reasoning.

'It is all very well, *carina*; in England, I daresay, it may answer. But your women are of a different temperament, and society is differently constituted. As long as parents have the right, as with us, of disposing of their daughters in the manner they think best suited for their eventual benefit, the less they learn beforehand of the tender passion, the better. There are reforms enough wanted amongst our political abuses, without seeking to introduce innovations into private life. The whole system must be changed, or else girls had better be left in their present ignorance and simplicity.'

'But, marchesa—— This from you, who are such an advocate of progress?'

'*Cosa volete?* I do not think the warm hearts of our daughters of the south could read as phlegmatically as Englishwomen those tales in which love and courtship are ever, must ever, be predominant.'

'And if they could thereby learn to form a more exalted idea of what we tax you Italians as regarding in too common-place a light? If they were led to look upon marriage less as a worldly transaction than as a solemn compact, not to be lightly entered into, but to be lovingly and faithfully observed?'

'If, if, my dear Utopist! If, instead of all these fine results, you gave them glimpses of a liberty and privileges they could never know, and so ended by making them miserable? Take my own case for an example. I was sixteen. I had never left the convent for nine years; I was always dressed in cotton prints, of the simplest make and description, and thick leather shoes, with great soles, that clattered as I walked along the mouldy old corridors, or ran about

with the other pupils in the formal alleys of the garden, of which the four frowning walls had so long constituted our horizon. My pursuits and acquirements had varied but little from what they were when I entered the convent; and to give you in one word the summary of the infantine guilelessness in which the *educande* were presumed to exist, I had never seen the reflection of my own face except by stealth, in a little bit of looking-glass about the size of a visiting-card, which I had coaxed my old nurse to bring me in one of her visits, and that we smuggled through the grating of the *parlatojo* concealed between two slices of cake!

'I knew this was to go on till a *partito* was arranged for me, for my parents did not like it to be said they had an unmarried daughter at home upon their hands; besides, many men prefer a bride fresh from the seclusion of the convent, and in those days especially; this was the strict etiquette. I had seen my eldest sister discontented and fretting till she was nearly twenty before the welcome *sposo* could be found, and I had no inclination to be incarcerated so long, though hope, and certain furtive glances at my mirror, kept encouraging me to look for a speedier deliverance.

'At last, one Easter Sunday—how well I remember it!—I was summoned to the *parlatojo*, and there, on the outer side of the grating, stood a group of my relations: my father and mother, my sister and her husband, and one or two of my aunts. I was so flurried at the sight of so many people, and so taken up with looking at the gay new Easter dresses of my visitors—my sister, I recollect, had an immense sort of high-crowned hat, with prodigious feathers, as was the fashion then, which excited my intense admiration and envy—that I had not time to bestow much notice upon a little dried-up old man who had come in with them, and who kept taking huge pinches of snuff and talking in a low tone with my father. My mother, on her side, was engaged in whispering to the Mother-Superior, and from her gestures, seemed in a very good humour; while the rest of the party drew off my attention by cramming me with sweetmeats they had brought for my Easter present.

'The next day but one, I was again sent for, and with downcast eyes, but a bounding heart, presented myself at the grating. There I found my mother, as before, in deep conversation with the superior, who, on my bending to kiss her hand, according to custom, saluted me on both cheeks with an unusual demonstration of tenderness.

'Well, Gentilina," said my mother, "I suppose you begin to wish to come out into the world a little?'

'I knew my mother so slightly, seldom seeing her more than once a month, that I stood in great awe of her; so I dropped a deep courtesy, and faltered: "*Sì, signora*;" but I warrant you I understood it all, and already saw myself in a hat and feathers even more voluminous than my sister's!

"The Madre Superiore does not give you a bad character, I am glad to find."

"*Ah davvero!*" was the commentary upon this, "the contessina has always shewn the happiest dispositions. At one time, indeed, I hoped, I fancied, that such rare virtues would have been consecrated to the glory of our Blessed Lady, and the benefit of our order; but since the will of Heaven and of her parents call her from me, I can only pray that in the splendour and

enjoyments that await her, she will not forget her who for nine years has filled a mother's place." And at the conclusion of this harangue, I was again embraced with unspeakable fervour.

"In my impatience to hear more, I scarcely received these marks of affection with fitting humility; while forgetting all my lessons of deportment, I opened my eyes to their fullest extent, and fixed them on my mother.

"Ha, ha! Gentilina," she said laughing, "I see you guess something at last! Yes, my child, I will keep you no longer in suspense. Your father and I, ever since your sister's marriage, have never ceased endeavouring to find a suitable match for you. The task was difficult. You are young, very young, Gentilina; and we could not intrust our child to inexperienced hands. It was necessary that your husband should be of an age to counterbalance your extreme youth. On no other condition could we consent to remove you from this so much earlier than your sister. But at last a *sposo* whom your parents, your family, the Madre Superiore herself, think most suitable, has been selected for you; and"—

"But I waited to hear no more. The glorious vista of theatres, jewels, carriages, diversions, which we all knew lay beyond those dreary convent-walls, suddenly disclosing itself before me, attainable through that cabalistic word matrimony, was too much for my remaining composure; and clapping my hands wildly, I exclaimed: "*Mamma mia—mamma mia*, is it possible? Am I going to be married? Oh, what joy, what happiness!" and then checking my transports, I said earnestly: "Tell me, mamma, shall I have as many fine dresses as Camilla?"

"I declare to you, signorina, that the name of my destined husband was but a secondary consideration; and when they told me he was rich and noble—the same individual who had come to the grating on the previous Sunday to satisfy his curiosity respecting me—I acquiesced without repugnance, ugly, shrivelled, aged as he was, in the selection of my parents. Knowing nothing of the world, having scarcely seen a man except our confessor, the convent gardener, and my father, I went to the altar eight days afterwards without a tear!—This sounds very horrible to you, I daresay; she resumed, after a short pause, in which, notwithstanding her careless manner, I saw some painful memories had been awakened; "but let me ask you—had my head been filled with notions of fascinating youths, as handsome as my Alessandro when I first remember him, kneeling at my feet, and saying: "*Gentilina*, I adore you!"—should I not have added a vast amount of misery to what, Heaven knows, was already in store for me—in resisting a fate which was inevitable, or whose only alternative would have been the cloister? No, no; since our domestic code is thus constituted, and as long as parents retain such arbitrary sway, let girls be left in happy ignorance that they have so much as a heart to give away! If they are to be married, they will then not dream of any opposition; if, on the contrary, as in the case of my poor sister-in-law, a suitable match has not been attainable, why, they will not, like her, be full of romantic ideas gathered from their books: and so, instead of wearying their family with their blighted hopes, will take the veil, and retire contentedly to a convent, limiting their notions of happiness to standing high in the good graces of the father-confessor, or the preparation of confectionary and cakes."

"If I believed you to the letter, marchesa, you would have me conclude that all the women of the Roman States are, or should be, totally uncultivated."

"Before marriage, I meant, remember that! Afterwards, all is changed. A woman of intelligence soon gets wearied of the frivolities she has been brought up to prize so highly, and will eagerly seek to instruct

her mind. Study will then be her greatest pastime and her greatest safeguard."

I knew she alluded to her own experiences, but I could not forbear pressing the subject: "And for those who have no refined understanding to cultivate, no desire to study, and yet have learned too late they have a heart which they were not taught must be given with their hand—what safeguard is there for those, marchesa?"

"*Per Bacco!*" she cried, shrugging her shoulders, "that is the husband's affair; nobody else need meddle with it! You see, my dear," she added, laughing at my dissatisfied air, "we are a long way off from the state of things you would desire to bring us to; and if you would wish for any reformation in this as well as in any of our other abuses, you must request your friends the English ministers, next time we try to shake them off, not to lure us on by sympathy and approbation, and then abandon us to worse than our former condition."

Subsequently, I ascertained that the marchesa did not advance any more than the opinions generally held by her country-people upon this subject; although there seems a strange inconsistency in persons ever disposed to rail at the defects of their internal policy, upholding these *rococo* ideas, alleging in their justification that the impulsive Italian character in youth is unsuited to the liberty conceded at so early an age to Englishwomen.

A lady I conversed with upon this system, some time afterwards in Ancona, supposed to have had a liberal education, having been brought up in Northern Italy under her mother's roof, told me that, although she did not marry till twenty, she had not previously been allowed to peruse any work of fiction, excepting one after she was betrothed, and that was *Paul and Virginia*! For which restriction, it may be parenthetically remarked, she fully indemnified herself in the sequel, being of a studious turn, by devouring all the French novels she could lay her hands upon.

Indeed, I could multiply anecdote upon anecdote to corroborate these statements; but I must reserve a little space to speak of the cultivation of the fine arts, which, judging by the limited patronage and still scantier remuneration accorded to their professors, would seem to be considered by many as dangerous as reading to a maiden's peace of mind. Of late years, however, music enters much more frequently into their programme of education. Though not yet introduced into the native convents, it is taught at the *Sacré Cœur* at Loretto, and in many private families, happily as yet with more discrimination than in England—the absence of voice or ear being considered insurmountable disqualifications. The art, especially in its vocal department, can boast, even in so remote a corner of Italy, of instructors superior to any procurable in England, except at those rates which some parents complacently mention as if to set a higher value on their daughters' acquirements. Blessings on the Italians in this respect, for they have no purse-pride! If you admire a lady's singing—and it is no rarity to hear streams of melody poured from those full rounded throats, such as would electrify a London drawing-room—some member of her family will not immediately inform you that she learned from the first masters at two guineas a lesson; that no expense was spared, and so forth. They do not understand John Bull's delight at framing all he does in rich gilding, and can enjoy the fine singing of their countrywomen notwithstanding that, in Ancona at least, instruction from no mean professor was attainable at two *pauls* (tenpence) a lesson.

The music-master who taught my cousins was director of the opera, composed and understood music thoroughly, and devoted himself, heart and soul, to his profession: to these recommendations he added a

very handsome exterior, great attention to his dress, gentlemanly and respectful bearing, and, nevertheless, gave twelve lessons, of an hour each, for a sum equivalent to ten shillings, and thought himself lucky too, to get pupils at that rate!

Painting, the twin-sister of music, does not enjoy the same amount of popularity. In a country, of which the churches and palaces teem with evidences of the estimation in which it was held scarcely two centuries ago, I saw only one instance, that of Volunnia's miniatures, where even, in its humblest branches, it was studied by one of the higher ranks. It is cast as a reproach upon the modern Italians that they can no longer furnish good painters; but the censure is more applicable to those who do not care to foster the talent so often doomed to languish in the ungenial atmosphere of poverty and neglect. The young artist, whose only pupils in Ancona were those furnished by my uncle's family, had studied several years in Rome, Florence, and Venice; had distinguished himself in his academical career, was full of enthusiasm and feeling, and yet so little encouragement did he receive in his native city, that it was difficult for him to earn his bread. It is almost superfluous to add, that he was as poor as any painter need be. He had one coat for all seasons; never ate but once a day, besides a cup of coffee at six in the morning, which he procured at a caffè, no fire being lighted so early at his mother's, where he lived; and had a starved, hungry look, like a lean greyhound, with large hollow eyes, and an attempt at an artistic beard. Poor fellow! his story presents so perfect an illustration of a new phase of Italian life, that I must not be considered too discursive if I conclude this paper with an account of it.

He had known my uncle's family for years, and considered himself under obligations to them, so that a little of the old Roman patron and client system was kept up in their intercourse; a respectful affection on his side, and a kindly interest in his welfare on theirs. His knowledge of art was really wonderful. As a boy, he had drawn his first inspirations from Raphael's frescoes in the Vatican, and worshipped him almost as a divinity; then ascending a step higher in *purista* principles, he devoted himself to the study of that branch of the Florentine school of which 'il beato Angelico da Fiesole' is the chief; and to hear him descant on his purity of outline and grace of composition, was in itself a lecture on design. A timely removal to Venice luckily saved him from the exaggerations into which all votaries of any peculiar style, however excellent in itself, must inevitably fall; on which, in fact, he was fast verging, as two or three pictures he had in his possession, painted while the impressions of Florence were still predominant, of ashen-hued saints, with marble-like draperies, abundantly testified: and leaving his legitimate admiration for the Beato Angelico unsubdued, yet sent him back, at the conclusion of his studies, glowing with rapture for Titian and Paolo Veronese. From the great works of the former, he had made a number of sketches and spirited copies; while he thought—as what young artist does not think—that he had discovered his peculiar secret of colouring, detailed to us, as he held forth triumphantly upon his flesh-tints and *impasto*. In addition to all these artistic disquisitions, he used, while we were taking our lessons, to give us all the political news, or rather the whispers which were stealthily in circulation, and often repeated that ours was the only house in which it was safe to express an opinion.

Then he would tell us a great deal about the crying evils of his country, much to the purport of what I have already stated; the ignorance of the women, the idleness of the nobles, the extortion and injustice of the government, and the insolence of the Austrians

who supported it—all being related in beautiful and poetic Italian; for he spoke his own language with great refinement, although he did not spell it correctly.

And yet, notwithstanding these constant discussions and conversations, never was he known to pass the limits of deference tacitly laid down, never once to venture on the verge of familiarity: years of intercourse, resumed at intervals since his boyhood, made no difference. He never came to the house but as a teacher; and at the end of each lesson, he always bowed with the same ceremonious respect, and backed out of the room with the same '*servo umilissimo*' as if he had been a mere stranger.

I wish I could detail some of the stories we heard from him—little romances in themselves, and admirably illustrative of the quick feelings and exaggerated sensibility of the Italian temperament, allowed more room for development in the *mezzo cello* than in the strict etiquette of the nobility. How a young cousin, becoming desperately in love with a young man she had only seen from an opposite window, pined rapidly away; and on hearing he was already affianced, insisted on taking the veil in a convent of a very strict order: how his own sister, a very beautiful girl, nearly broke her heart from the cruelty exercised by her mother-in-law, who tried to sow discord between her and her husband, opened all the letters she received from her parents, took away all her best clothes, and distributed them among her own daughters—in fact, behaved like a *suocera* in all the acceptation of the term. But nothing interested us so much as his own history, in which he at last made us the recipients of the misery and uncertainty that were destined to be inseparable from his existence. We had observed that for some weeks he looked more than ordinarily wo-begone, scarcely spoke, and his unbrushed hair stood erect with an air of distraction it was pitiable to witness. The usual inquiries about England, the lectures upon art, the pæans to Raphael, were all at an end, and our lessons were becoming very stupid, common-place affairs, when, one day, as he was cutting a crayon, he suddenly laid it down, and said falteringly: 'Signorine, will you excuse my temerity, if, knowing all your benevolent interest in me, I tell you what makes me so ill. I have fallen in love.'

'Indeed!' we exclaimed; 'tell us all about it. Where is the lady?—how long has it been going on?—when will the *sposalizio* take place?'

'Alas!' he replied, 'what can I say? I have never spoken to her; it is two months since I first saw her; it was one evening outside the gates: she was with her mother. I beheld that modest ingenuous face, and my fate was decided. Miserable was I born, miserable have I always been, but never so miserable as now.'

'Wherefore?' I inquired, with a perplexed expression.

'Because I have no means of maintaining her—not even a few hundred dollars of my own: therefore it is of no use attempting to make the acquaintance of her family, or presenting myself as a suitor. O signorine! I have suffered so long, my secret was wearing me to the grave.'

'But you have an *avvenire*—a future, at least,' said my cousin Lucy, who, under all her sedateness, was rather of an enthusiastic turn.

'Ah,' answered he, shaking his head, 'that is easy to say, for you English: we poor Italians have no future; we never can rise; we are but fools to dream of it.'

'Then do you not mean even to try to improve your fortunes, so as one day to be able to marry?'

'Heaven knows whether I do not try,' was the rueful response; 'but the days for art in Italy are gone by. You are witness, ladies, to the patronage accorded to me here. What have I to look back upon

since I established myself in Ancona? One or two commissions from convents for the apotheosis of some new saint—a few portraits—at such rare intervals, and on such hard terms, that I verily believe if I were a house-painter, I should succeed better than with my aspirations to be an historical one."

"Yet why despair?" I persisted; "why not obtain an introduction to the family of the fair *incognita*, explain your views, and if they hold out any hopes of your ultimately being accepted, you will work away with redoubled energy. You might go and paint signs in California." (That was all the rage just then.)

"The signorina is laughing at me, I see, but it would not be right according to our ideas. She had better know nothing of me; her peace of mind might be disturbed. Those friends whom I have consulted, tell me I ought even to avoid passing her when she is out walking, or going to look at her at mass. Her character is evidently so full of sensibility, that it would be easy to destroy her happiness."

"How can you be so sure of all this, if you have never spoken to her?"

"I see it all perfectly in her face," he answered with a determined belief in his own powers of observation, which no ridicule or reasoning could shake. His romantic passion amused us all excessively, and as he evidently liked to talk of it, the disclosure having been once made, we were in future kept fully informed of all his tortures, fears, and despondency; but fancied that an attachment, hopeless and baseless as this, could not be of long duration. Contrary, however, to what we anticipated, he became more and more in love; he looked every day thinner, his hair more wiry, his eyes unnaturally brilliant and deeper sunk.

One morning—a real wintry morning, one of the few we ever saw—he came in, livid and trembling, with a wildness in his appearance that was startling. He did not leave his hat in the hall, as was his custom, but entered with it in his hand, and making a few steps forward, paused abruptly, and said in a hoarse voice:

"The signorine will excuse me if I pray them to dispense me from my attendance for a few days. I am going into the country—yes, into the country!"

When an Italian goes into the country at such a season of the year, he must be in a desperate plight, and we anxiously demanded the reason of this rash step.

"Signorine, I am mad—I am jealous! Yesterday, I was looking up furtively at her window; another man was standing in the street near me; I fancied I had seen him there before: still a suspicion never crossed my brain, when the window opened, and she looked out. Never had she deigned to do this for me. As I live, her eyes rested upon him! All the furies seized me; I rushed to the house of my friend, my best friend, the *Avvocato D—*. I raved, I tore my hair, I imprecated curses upon her. He took me by the arm. "To-morrow, you must go into the country," he said; "I will accompany you." Yes, signorine, with twelve inches of snow upon the ground, I go into the country!"

And into the country he went, and from the country he returned in two or three weeks' time unrecovered; although convinced that his jealousy was groundless, the national specific had failed in this case. Then I fear we did him harm, for on the 'nothing venture, nothing have' principle, we counselled him to embody his hopes, prospects, and honest determinations, in a letter to be submitted to the young lady's family, belonging like his own to the middle classes, though more affluent in their circumstances.

Taking an injudicious *mezzo termine*, he humbly presented this epistle to the fair *Dulcinea* herself, as she was coming one day out of church under the care of some aunt or elderly female relation.

Haughtily flinging it on the ground, the damsel

indignantly said: "I do not know how to read letters of this description," and passed on. Her virtue and discretion increased his admiration, while the repulse almost broke his heart. He never made any further attempt to press his suit, but moped and pined away perceptibly; in fact, he was dying of mortification and grief—so common an occurrence in this part of Italy, that they have a distinct name for the affection, and call it *passione*.

At this juncture, some friends of his who had emigrated to Tunis, in the recent troubles of Italy, wrote to recommend his joining them there; and urged on by the representations of all who were interested in his welfare—his desperate condition sanctioning so desperate a step as foreign travel was usually looked upon—encouraged especially by ourselves, with our restless, enterprising British notions, he embarked in a small trading-vessel, almost reduced to a skeleton.

Months, nay, years have passed since then, and it seemed as if all clue to the poor young painter were completely lost, when, by a strange coincidence, I received a letter from him at the very moment when the ink was still wet upon the page where I had been relating his ill-starred attachment: I wish I could transcribe the whole of this letter, I wish it could be laid tangibly before my readers—so clumsily, squarely folded, with its coarse red seal, stamped with some copper coin very probably, its stiff handwriting and deficient orthography; and its contents, so simple, so poetical, so unassuming, of which a few extracts, to give the continuation of his vicissitudes, can furnish but a very imperfect idea.

After relating the failure of the hopes with which he had landed at Tunis, he says, that resolved to leave no path that might lead to independence unexplored, he even set his beloved art comparatively aside, and had betaken himself to whatever honest employment he might find. Entering the service of the Pacha of Tripoli, he had been sent as a mineralogist—"for amongst the Turks," he naively remarks, "one may do anything—far into the interior, amongst men and manners completely different from our own, to explore a mine reported to be of silver, but which, with my usual ill-luck, turned out of very inferior iron." Then encouraged by the pacha's promises, he accompanied him to Constantinople, where, finding to his cost that he must put no faith in princes, he turned to his painting again. But the city was swarming with Italian refugees, artists among the rest, all contending for the bare means of subsistence; so, after a few months of painful struggles, he went back to Africa, and entered into some trading speculations. Neither in this new career was he successful. Perhaps he worked with a sinking heart, for the tidings reached him that the young girl so faithfully loved was about to be married; and 'what imbibed this announcement, was learning that the character of her future husband offered but slender prospects for her happiness.' His little ventures failed; his resources were exhausted; and he was under the necessity of returning to his native country. There he found strange reverses had suddenly befallen her whom he had schooled himself to look upon as irrevocably lost. Her parents were both dead; the marriage had been broken off; and from comparative affluence, she was so reduced, as, jointly with a widowed sister, to have opened a day-school for little girls.

"I saw her then," he goes on, "under the pressure of sorrow. I found her in the words of Petrarch, *più bella, ma meno altera*; and yet, even at that moment, my cruel destiny prevented me from saying: "I am here to comfort and sustain you!"

Once more he went forth, hoping against hope, with the aim of establishing himself as a portrait-painter and drawing-master at —, on the shores of the Mediterranean, whither many English families annually

resort; and the object of his letter was modestly and unaffectedly to request that if I knew any of my country-people intending to winter there, I would recommend him to their notice.

I felt very sad to perceive how he overrated the *signorina forestiera's* influence, and the extent of her acquaintance; or else in his simplicity imagining that to be English is synonymous with belonging to a vast brotherhood, giving and demanding the hand of fellowship on every side. I wish it were thus in this instance at least, for the first use I should make of this blissful state of fraternity, would be to claim patronage and encouragement for the poor artist, whose history then could soon be pleasantly wound up like orthodox story-books, in these words, 'and so they were married, and lived very happily all the rest of their days.'

THE WEATHER AND THE PARKS.

THIS is the time, as an eminent Whitechapel individual once observed to me in confidence, 'when vicious indulgence prevails, and everybody puts both hands into his own coat-pockets,' so that one may walk 'on the C side of Regent Street'—he was accustomed to speak of the metropolis in relation to its police distribution—'from morn to eve without getting a chance at snuff-box or pocket-handkerchief.' It is dusky enough for my friend's purposes, too, even at noonday; the sun is blood-red, and the atmosphere so heavy, that the smoke can't rise, but forms 'an under roof of doleful gray' all over London. Snow is in the streets inches deep; and the driver of your four-wheeled cab insists in vain that his mare is quite strong enough for the work, and contents herself with a footspace only because she's 'artful.' The pavement is masked with ice, and old gentlemen in quiet squares about Paddington, sally out with red slippers over their shoes, and poles with pikes in them, like superannuated banditti. Upon all sides, in crowded pathways, are heard such ejaculations as these: 'Mercy me!' 'Good gracious!' 'Well, I never!' 'Take care, Marianne!' Stout females for the most part come down in a sitting posture, and are obliged to employ the assistance of the civil force to re-erect them; stout males, who are always expecting it, and whose attention is never distracted by shop-windows, generally manage to fall upon all-fours. Great streams of people are always setting from or towards Hyde Park; they throng the paths, and loom across the fog like funeral processions. The sheep that were white last week, are now turned black, the trees are black, and the marble arch is coaly by contrast with the snow. At the eastern end of the Serpentine, the poor frozen-out water-fowl are huddled together, as in expectation of attacking cure. Little children who have come to stare, and not to give, are attacked by justly indignant swans, which insist upon getting satisfaction out of their mottled arms; and the military, which is a life-guardsmen attached to the nurse, is obliged to be called in to their help. A great troop of these horse-soldiers is passing in the distance; and their red plumes and cuirass, and black chargers, make a fine pageant upon the snow, and a pleasant music in the clear frosty air. This is at nine o'clock; but between seven and eight in the morning, the ice is broken on the south side for the bathers, of whom, to-day, there are no less than five—two of them gray-headed Polar bears from the Arctic Ocean, and three younger persons, probably religious fanatics. A few skaters are skimming, swallow-like, in their vicinity, and a Humane Society's man is standing by with a savage expression of countenance, and a harpoon, as though they were whales.

As the crowd increases, the professional gentlemen who have invested their capital in skates and a chair, increase likewise, and are prepared to let the former out at sixpence per pair per hour—a deposit of five shillings being required as a guarantee for their return. Under the chair is sometimes a bottle of brandy, to be used medicinally in keeping up the courage of the patient; and even after that restorative, he will often insist upon the proprietor's accompanying him a little way upon the ice until he 'feels his legs,' which he accomplishes, to all appearance, by stretching out his arms like a baby, and catching at the air. A skate-lender, with whom I spoke upon the smallness of the deposit, assured me that he had never lost but two pair in a long experience, and those under very peculiar circumstances.

'A gentleman came to me,' said he, 'some few years ago, to have a couple of hours of it, who said he had nothing about him under a five-pound note. He was so perfect a gentleman, so slap-up, so kiddy, that I said: "Well, I'll trust you." He was affable and pleasant as could be while I was putting on the irons, but he kept his eye about him all the time, as though he was expecting somebody he didn't want to see.

"I wish it was Sunday, my man," says he.

"Why so, sir?" says I.

"Why, because—Here, let me go," says he; "hang the strap;" and in a moment he'd pulled me down the bank, and broke away from me like a harrow from a bow. A great big chap with a hook nose caught hold of me as I let go, but just missed nabbing the 'tother one.

"I'm a bailiff," says he, "and I want that man."

"Are you?" says I, "and do you?" says I, "for I ain't fond of that sort nobow."

"Yes," says the gentleman, who had fastened his strap by this time, and came skimming up quite close to us under the bank; "he's a bailiff, he is, and a very nice bailiff too—ain't you, Solomons?" I'm sorry to be obliged to go so much faster than you with these here skates on, and so to be deprived of your valuable company. By bye, Solly;" and off he went again, backwards, for he was a real good skater.

"Let me have a pair," says the bailiff presently, who was getting awfully riled.

"Certainly," says I; "but I should like to see the five shillings first, for your friend has not left a farthing with me."

"He hasn't got a farthing," says the bailiff, grim enough. "Now, Mr Halphonso Cavendish 'Oward, let us see who is the fastest;" and off went the Jew after his game at a pace that was a caution to engines.

"Look out!" hollers I; "Look out!" heechoes the people; and the next moment, there they was, hare and greyhound, twisting and turning, and overshooting one another in a manner putty to behold. Moses was the better man on the irons, out and out; and the other, finding his-self beat, stood out for the part marked *Dangerous*, with the Humane Societies a-hollering at him from both sides, and him not caring one icicle. It was sink or swim with the gent, you see, all ways; and the bailiff—that I will say—stuck to him like a man. 'The ice quivered and cracked whenever they came together; and three times the Jew's hand was upon his collar, and three times he got away; when all of a sudden Mr 'Oward starts off as hard as he can go for the bridge, trusting to his speed to take him over the rotten ice before it had time to give—and he did it too. He came right on to the place in front of the Skating Club yonder, and they do say he was as pale as ashes with the fright; but he got safe away anyhow—with my pair of skates.'

'Ah, then,' said I, after this long narration, 'I suppose the Jew thought twice about following him under the bridge?'

'No; he put the steam up, and tried it on too; but there he went in—he did.'

'Bless me!' said I, 'it must have been very hard to have rescued him from such a position?'

'It was hard, I believe you, sir; and the man was drowned—and that's how I lost my second pair of skates.'

Those who bring these implements with them are a still finer sight than the hirers. They sit down in the snow on the other side of the pathways, and occupy themselves for about half an hour in the most miserable manner. Blue-nosed, red-handed, numb, they then hobble into the throng very cautiously, and seizing the most good-natured-looking person's arm, request, as a personal favour, that he will 'see them in.' With this assistance, a steep bank has to be descended, from which the skater must necessarily start rectangularly, at the rate of eleven miles an hour, into the midst of a vortex of people darting everywhere at twice that velocity. Whenever the ice gives way with one person, it gives way with more; for immediately upon an accident happening, skaters and sliders, and even people who have not ventured upon the ice before, all crowd round the unfortunate object, and embarrass him with gratuitous advice. Some of these go in; and then the Humane Society come, and some of these go in; and ladders, and trucks with barrels upon them, and ropes, and double Esquimaux sledges, are obliged to be put in requisition to save them. When the breakage is pretty near the bank, the chief danger arises from an excited public, who snatch down the fourteen-foot poles with hooks at the end of them, which hang from the neighbouring trees, and proceed to rescue their fellow-creature out of four or five feet of water, without paying the least attention to where the hooks may run into him. When a hole is once made, it soon becomes popular as a place to tumble in; some skaters can't stop themselves very easily; others, principally gentlemen in government offices, cannot be convinced that the line they have always been accustomed to take is not the very best one still, and only find out their error when it is too late. Then it is a grand sight to behold the immersed bodies running as hard as they can go, with water spouting from them as from a housemaid's mop, to the Society's lying-in establishment, for brandy and blanket.

The view on either side from the top of the bridge is very singular: the banks are so thronged with walkers that you can't see ground; the drive is as crowded with carriages as in the height of summer, and the surface of the ice is covered with a sort of shifting kaleidoscope of people at full speed—with the exception of a few soldiers, however, and of still fewer of the softer sex in gay attire. These are but a blank lot, and resemble, perhaps, as much as anything—what I found to be the accepted similitude upon the bridge—a heap of spiders in a quart-bottle. I am not sure but that those who slide have the better fun, and, at all events, they seem to enjoy themselves more than the skaters. That long, swift gliding line of theirs, which never ends, comprised of such unequal materials—the steady, stout, old gentleman with muffetees, who is caught round the waist and carried on by other people every time; the youth who travels backwards with the same facility as forwards; the unhappy aspirant who will turn round sideways, and is instantly swept from the slide; and the *artiste*, who skims along upon one leg, and snaps his fingers all the time as though they were castanets—forms a pleasant type, it seems to me, of human life.

But by very far the best of this entertainment, and the one which sent me home delighted beyond all things with the weather and the parks, was this: A cheerful-looking lady of middle age, well dressed and seasonably, accompanied by her little foot-page, was sliding as merrily as any: she took but a short, dumpy run

from the bank, to be sure, and was not the express-engine by any means; but the faithful Johnny was ever behind her, like an affectionate tender; and placing his hands on either side her waist, impelled his mistress to the goal, with safety and celerity, every time. She seemed to me an infinitely more sensible person than the frozen dowagers who were circling round the park in their shut-up carriages, and whose footmen were congealing behind them; but I doubt not, in the opinion of society, that the persevering old lady-slider was mad.

OCCASIONAL NOTES.

WORK OF LAW-REFORM.

Law-reform is now, and has been for some time past, the fashion of the day, and a favourite popular theme; for not only do lawyers write and talk about it, but persons also, unfortunately, who are entirely ignorant of the law or its practice. The principles of this latter class of law-reformers, so largely represented both in the press and the House of Commons, are—that lawyers should be done away with altogether; that all the law of the land should be carried in a pocket-volume; and that it should be so plain and simple that a child might expound it. In a word, the question of law-reform is usually taken up either for the purpose of gaining notoriety, or for professional ends, or as a stepping-stone to office.

Law-reform is to be the business of the present session, and, as in the last, much is promised; but let us hope that, unlike the last, the promises may be fulfilled. The reason why so little is done is, that too much is attempted at once, and that there are too many reformers in the House. There is now no party: everybody sets up for himself, and each wishes to have reforms after his own fashion, refusing to give precedence to any other; and thus time is wasted in individual quarrels and struggles for priority, and little or nothing is done.

Since 1852, changes have been incessant, both in law and equity; some good has been accomplished; and technicalities have almost, if not altogether, disappeared. A lawyer may now hope to see the beginning and end of several Chancery suits in the course of his professional career, and the expense of such suits has been considerably diminished. Great reforms have taken place, likewise, in the practice of the courts of law; and in 1854 an equitable jurisdiction was given to these courts, although this as yet has not been productive of so much good as was expected. In the same year, and by the same act of parliament, it was ordained that a judge, having the consent of the parties concerned, may hear causes without the intervention of a jury; and this greatly expedites business at the sittings for Middlesex, where it is sometimes difficult to get a sufficient number of jurymen. In 1855, the celebrated 'Limited Liability Act' was passed, notwithstanding considerable opposition. The argument against it is stated by a great commercial authority, Mr Edmund Phillips, in a pamphlet on the subject, published last year: 'The injustice of Limited Liability Companies,' says he, 'must be apparent when it is considered that this act will empower a number of individuals to embark in business in opposition to the regular merchant or trader; but that the risk of the stronger body is not nearly so great or vital as the risk of the poorer individual; for if the merchant or trader fail—which he is most likely to do, in consequence of the reckless trading of the opposite company—he and his family are, by the bankruptcy laws, stripped of every earthly thing which they possess, even to their very beds; but if the company fail, its members are not liable to

be called upon to pay one shilling more from their private properties than they have thought proper to embark in the concern; and this is, in fact, only the idle money they can afford to lose, and scarcely care for. To extend this Limited Liability Act a little further, would be to declare that no one need pay his debts unless he thinks proper, and which ought to be the rider to the act to be consistent or fair. This Limited Liability Bill ought, therefore, to be called "An Act for the better enabling Adventurers to interfere with and ruin Established Traders, *without risk to themselves*." On the other hand, it may be said that the individual trader has an immediate control over and supervision of his affairs which the member of a joint-stock company has not. We must express our own feeling, that it would be a great pity if the principle of limited liability, under fair restrictions, should fail, as it certainly contains a bud of high promise for the working-classes of this country, in offering inducements to saving, and counteracting so far the tendency to reckless expenditure on vicious indulgence.

The statute most affecting the mercantile community passed last session, is the mercantile Law Amendment Act—the principal clauses of which provide that bills of exchange must be accepted in writing, and signed by the acceptor or his agent; and that a guarantee no longer requires a consideration for making it to appear in the writing. Alterations are likewise made in the limitations of actions, &c. The chief object of the bill, when brought into parliament, was to abolish the seventeenth section of the statute of frauds, which requires all contracts for the sale of goods or merchandise above the value of £10 to be in writing, or a part of the goods to be accepted, or a part of the price to be paid, before an action could be brought on the contract. The mercantile world, however, seemed to be afraid that if this clause were repealed, they would be saddled with contracts which were never made. They forgot that the clause would not have prevented them from entering into a written contract when they chose. In Scotland, there is no law requiring such contracts to be in writing; and in England, in practice, by far the greater number of mercantile contracts are merely verbal.

Last session, a bill was brought in by the solicitor-general to abolish those abominations, the ecclesiastical courts; but on account of there being so many reformers, each wanting to have the act framed according to his own fancy, it was lost. There is, however, another attempt—the sixteenth, it is said—to be made to accomplish the same object during the present session.

Another good measure lost last session was the bill for amending the law of divorce. The law of divorce is a disgrace and reproach to the country. As the law now stands, the outraged husband cannot obtain a divorce unless he first publicly parades his wife's shame and his own dishonour, and gets the verdict of a jury and damages for the injury. What can be more monstrous than this! Again, the expense of obtaining a divorce is so heavy as to preclude all but the most wealthy from resorting to it. Lord Brougham, in a letter to Lord Radnor, after some severe strictures on the law of divorce, says: 'It would really be a libel upon parliament to suppose that a much longer time can elapse before the law shall be freed from the shameful defect now so generally and so justly complained of.'

A bill is to be brought in during the present session for the purpose of bringing breaches of trust within the reach of the criminal law. This ought to be, for morally there is no difference between unlawfully taking the property of another, and appropriating the same property when lawfully in your charge. In

Scotland, the offence is punished criminally; but in England there is no remedy beyond a civil suit against this species of robbery. It generally happens that the trustee who has committed the fraud becomes either bankrupt or insolvent, or else flies the country; a civil suit, therefore, is out of the question; and those whom he has brought to ruin, and who are generally minors, have no remedy. But provision should be made for remunerating trustees for their time and trouble, else who will take upon themselves this onerous and irksome duty?

The law of partnership, too, is to be amended during the present session—the difficulties attending the familiar affix '& Co.,' are to be removed by a compulsory registration of partnerships. The objection to the affix '& Co.' is felt thus: a firm trade and incur debts under the style, for example, of 'John Smith & Co.' A creditor wants to recover his debt against all the partners; but as he does not know who they are, he sues John Smith alone—that is, if the bankrupt does not object, which the law allows him to do; and as it often happens that the partner ostensibly put forward has nothing to lose, the real debtors escape, and the creditor is duped.

The law of bankruptcy, it is said, is also to be the subject of amendment, and, it is needless to remark, that no branch of our laws more requires it. Amongst other amendments, one to amalgamate the law of bankruptcy and insolvency should be made; there is no ground for having them distinct, so as to require separate courts and judges.

The attorney-general, Sir Richard Bethel, has promised, and no doubt intends to keep his promise, to bring in a bill to do away with deeds of conveyance on the transfer of real property; and he proposes to assimilate the transfer of this description of property to the transfer of stock in the funds, or of property in ships. This scheme seems anything but practicable, and the difficulties attending it are manifold. How are the interests of mortgagees, or persons interested under marriage-settlements, to be protected? Again, how is the property to be identified?—for real property, with rights of way over it, rents issuing out of it, and many other peculiarities, is not described so easily as so much stock. There are many other difficulties which it would seem impossible effectively to overcome.

Let us hope, however, that during the present session, legal reform may be carried on in a proper spirit, and that the evils complained of may be removed.

GOOD NEWS OF THE NATIONAL HEALTH.

One of our public functionaries has a habit of taking stock once a quarter, in anticipation of his annual summing-up. His report for the last quarter of 1856 is now before us, and we find it begin with so very satisfactory a piece of information, that we cannot deny ourselves the pleasure of aiding its publicity. It is—that not only in the last quarter, but during the whole four quarters of 1856, 'the health of the population of England and Wales was better than it was in any of the previous ten years.' A fact like this, given forth by the registrar-general, will no doubt be read with satisfaction everywhere. Notwithstanding the consequences of a costly war, double income-tax, and some other difficulties, we are in good health, better than at any time since 1846. So we have something to be thankful for, after all.

'The effects of sanitary measures,' says the registrar, 'are becoming apparent, although they are only partially carried out within limited areas.' From 1846 to 1855, the average of deaths was 23 in 1000; from 1855 to 1856, it fell to less than 21 in 1000. The conclusion drawn from these figures 'is decisive.'

The state of better health is shewn, moreover, in the

consequences: the births in 1856 were beyond the average. The number for the year was 657,704, the highest ever registered in England, and exceeding by 22,581 the number in 1855. One county only, Westmoreland, shews a decrease; the increase in some of the others is attributed to the return of men from the war.

The same influence is observable also in the marriage returns, taking only the summer quarter. In Devonshire and Hampshire, particularly in the districts near Portsmouth, the increase in the number of marriages is considerable. Ships came home from the Black Sea and the Baltic, the crews were paid off, and Jack, having his pockets full of money, and nothing better to do, got married. But apart from the discharge of sailors, the registrar tells us there is an increase of marriages in every division of the kingdom from which he derives his returns. In Kent, the increase was greater than in Lancashire or Yorkshire; in Norfolk, the chief increase was in Norwich; and in nine counties—namely, Sussex, Wilts, Dorset, Gloucester, Salop, Rutland, Derby, Cheshire, and Northumberland—the number of marriages was less than in the corresponding quarter of 1855.

The number of deaths for the year amounts to 391,369. It was 426,242 in 1855, and 437,905 in 1854—thus shewing a remarkable improvement for 1856. We are better off, notwithstanding all our grumbling. And seeing that in the last quarter there were 157,615 births and 96,521 deaths, there remains a real increase to the population of 61,094; and taking the whole year, the increase was 266,355. To quote the registrar's words: 'The natural increase of population in the United Kingdom was probably at the rate of 1000 a day.' It would seem that nature is in haste to make up the losses occasioned by the war.

Recurring to last quarter, we are told that 39,063 persons emigrated in the three months, whereof 19,211 were English, 15,467 Irish, 2406 Scotch—the remainder 'foreigners,' and undescribed. It is something new to find the Irish outnumbered by the English; and that while 5987 embarked for the United States, 13,198 sailed for Australia. The number of English emigrants for the year 1856 was more than 70,000.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXXII.—A DEAD SHOT.

THE unexpected closing of the conference elicited an angry shout from the Mexican horsemen; and, without waiting for orders, they galloped up to their chief. Halting at long-range, they fired their carbines and scoppettes; but their bullets cut the grass far in front of us, and one or two that hurtled past, were wide of the mark.

The lieutenant, who had been only stunned, soon recovered his legs, but not his temper. His wrath overbalanced his prudence, else the moment he found his feet, he would have made the best of his way to his horse and comrades. Instead of doing so, he turned full front towards us, raised his arm in the air, shook his clenched hand in a menacing manner, accompanying the action with a torrent of defiant speech. Of what he said, we understood but the concluding phrase, and that was the bitter and blasphemous *carajo!* that hissed through his teeth with the energetic aspiration of rage and revenge.

That oath was the last word he ever uttered; his parting breath scarcely carried it from his lips, ere he ceased to live. I heard the fierce word, and almost

simultaneously, the crack of a rifle, fired close to my ear. I saw the dust puff out from the embroidered spencer of the Mexican, and directly over his heart; I saw his hand pass rapidly to the spot, and the next moment he fell forward upon his face!

Without a groan, without a struggle, he lay as he had fallen, spread, dead, and motionless upon the prairie!

'Thur, durn yur carako!' cried a voice at my shoulder; 'ee won't *bid* for me agin, ee skunk—thet ee won't!'

I needed no explanation, though I turned involuntarily to the speaker. Of course, it was Rube. His rifle was smoking at the muzzle, and he was proceeding to reload it.

'Wa-hoo—woop!' continued he, uttering his wild war-cry; 'thet shortens thur count, I reck'n. Another nick for Targuts! Gi' me *her* for a gun. Wagh! a long pull it wur for the ole weepun; an the glint in my eyes too! The niggur riled me, or I wudn't a risked it. Hold yur hosses, boys!' he continued in a more earnest tone: 'don't fire till I'm loaded—for yur lives, don't!'

'All right, Rube!' cried Garey, who hastily passing under the belly of his horse, had re-entered the square, and once more handled his rifle. 'All right, old boy! Ne'er a fear! we'll wait for ye.'

Somewhat to our surprise, Rube was allowed ample time to reload, and our three barrels once more protruded over the shoulders of Garey's horse. Our animals still held their respective positions. Three of them were too well used to such scenes, to be startled by the detonation of a rifle; and the fourth, fastened as he was, kept his place perforce.

I say, to our surprise, we were allowed time to get into our old vantage-ground; for we had expected an immediate charge from the guerrilla.

Vengeance for the death of their comrade would give them courage enough for that; so thought we; but we were mistaken, as their ire only vented itself in fierce yells, violent gestures, and loud cries.

They had clustered around their chief without order or formation. They seemed to pay but slight regard to his authority. Some appeared urging him to lead them on! Some came galloping nearer, and fired their carbines; others shook their lances in a threatening manner; but one and all were careful to keep outside that perilous circle, whose circumference marked the range of our rifles. They seemed even less inclined for close quarters than ever; the fate of their comrade had awed them.

The dead man lay about half-way between them and us, glittering in his picturesque habiliments. They were weaker by his loss, for not only had he been one of their leaders, but one of their best men. They saw he was dead, though none had dared to approach him. They knew the Texan rifle of old—these spangled heroes; they saw, moreover, that we were armed with revolvers, and the fame of this terrible weapon had been already carried beyond the frontier of the Rio Grande.

Notwithstanding all that, men of our race, under similar circumstances, would have charged without hesitation. So, too, would men of theirs, three centuries ago.

Perhaps in that band was an Alvarado, a Sandoval, a Diaz, or De Soto! only in name. O Cortez! and

you *conquistadores*! could you behold your degenerate descendants!

And yet not all of them were cowards; some, I dare say, were brave enough, for there *are* brave men among the Mexicans. A few were evidently willing to make the attack, but they wanted combination—they wanted a leader: he who acted as such appeared to be endowed with more discretion than valour.

Meanwhile, we kept our eyes fixed upon them, listening to their varied cries, and closely watching their movements. In perfect coolness, we regarded them—at least so much can I say for my comrades. Though life or death rested upon the issue, both were as cool at that moment as if they had been only observing the movements of a gang of buffaloes! There was no sign of trepidation—hardly a symptom of excitement visible in the countenance of either. Now and then, a half-muttered ejaculation, a rapid exchange of thought, relating to some fresh movement of the enemy, alone told that both were alive to the peril of the situation.

I cannot affirm that I shared with them this extreme and perfect *sang froid*; though upon my nerves, less indifferent to danger, their example had its effect, and inspired me with courage sufficient for the occasion. Besides, I drew confidence from another source. In case of defeat, I had a resource unshared by my companions—perhaps unthought of by them. Trusting to the matchless speed of my horse, as a last resort, I might possibly escape. I could have ridden off at that moment without fear of being overtaken, but the craven thought was not entertained for an instant. By my honour, no! I should have accepted death upon the spot rather than desert the brave men who stood by my side. To *them* I was indebted for my life. 'Twas for *me* that theirs were now in peril; and from the first moment I had determined to stand by them to the end, and sell my blood at its dearest. In the event of both falling before me, it would then be time to think of flight.

Even this contingency had the effect of strengthening my courage, and at that moment I viewed the vengeful foe with a coolness and freedom from fear that now, in the retrospect, surprises me.

During the interval of inaction that followed, I was cool enough to reflect upon the demand which the guerrilla leader had made—the surrender of my person. Why was I singled out? We were all enemies alike—all Americans or Texans—on Mexican soil, and armed for strife. Why did they want *me* alone? Was it because I was superior in rank to my companions? But how knew they this?—how knew they I was a 'ranger captain?' Ha! they must have known it before; they must have come out specially in search of me!

A light flashed suddenly into my mind—a suspicion strong almost as certainty. But for the sun glancing in my eyes, I might have earlier obtained an explanation of the mystery. I drew down the visor of my forage-cap, stretching it to its full extent; I increased the shade with my flattened palms, and from under them strained my eyes upon the leader of the band. Already his voice, while in conversation with Garey, had aroused a faint recollection within me. I had heard that voice only once, but I thought I remembered it. Guided by my suspicion, I now scrutinised more closely the face of the man. Fortunately, it was turned towards me, and despite the dazzling of the sunbeam, despite the slouched sombrero, I recognised the dark features of Rafael Ijura! In that glance I comprehended the situation. He it was who wanted the 'ranger captain!'

There was doubt no longer. My suspicion was a certainty; but with the next throb of my heart rose another, a thousand times more painful—a suspicion of—

With an effort, I stifled my emotions; a movement was perceptible among the guerrilleros; the moment of action had arrived!

CHAPTER XXXIII.

A RUNNING-SHOT.

Though our enemy was once more in motion, we no longer anticipated a direct attack; the time for that had passed. The fate of their comrade had evidently checked their ardour, and too much shouting and bravado had cooled, rather than heightened, their enthusiasm. We could tell by their manœuvring that some new mode of assault had been planned, and was about to be practised.

'Cowardly skunks!' muttered Rube; 'they hain't the pluck to charge us! Who ever heerd o' fair fight in a Mexikin? Wagh! Thur arter some trick, be continued, in a more serious tone. 'What do 'ee think it be, Billee?'

'I'm thinkin, old boy,' replied Garey, whose keen gray eye had been for some time fixed on the movements of the guerrilla—'I'm thinkin thar a goin to gallup roun, an try a shot at us Injun fashion.'

'Yur right,' assented Rube; 'thet's thur game! Scalp me ef 'taint! Look yander!—thur they go!'

The horsemen were no longer in line, nor formed in any fashion. Irregularly grouped, they exhibited a 'clump' upon the prairie, some standing still, others in motion. As Rube uttered the last words, one of them was seen to shoot out from the main body, spurring his steed into a gallop as he parted from the crowd.

One might have fancied he was about to ride off from the ground: but no; that was not his intention. When he had made half-a-dozen stretches over the plain, he guided his horse into a curve, evidently with the design of riding around us.

As soon as he had gained some score of yards from the troop, a second horseman followed, repeating the manœuvre; and then another and another, until five of the band, thus deployed, galloped round us in circles. The remaining six kept their ground.

We observed that the five had left their lances behind them, and carried only their carbines.

We were not astonished at this: we divined the intention of our enemies. They were about to practise an old prairie-tactic—a stratagem of the horse-Indians, with which all three of us were familiar.

We might have been more apprehensive about the result had it been really Indians who were going to practise the manœuvre—since in an attack of this kind, the bow, with its many missiles in a minute is far more dangerous than either carbine or rifle. But the fact that our assailants understood the stratagem, told us we were opposed to men who had seen Indian-fight—no doubt, the pick men of the frontier—and to defend ourselves would require all the courage and cunning we possessed.

It did not surprise us that only a portion of the band galloped out to effect the surround; there was design in that, and we knew it. The five who had been detached were to wheel round us in circles, dash at intervals within range, fire their carbines, kill some of our horses, keep us distracted, and, if possible, draw the fire of our rifles. This purpose effected, the other six—who had already approached as near as was safe for them—would charge forward, empty their guns, and then use their lazoos with effect.

Of this last weapon my companions had more dread than of all the others carried by our foes. They had reason. They knew that our rifles once empty, the lazo could be used beyond pistol-range; and by such men, with far surer aim than either carbine or escopette!

We were allowed but scant time to entertain these

doubts, fears, and conjectures, or to communicate them to one another. They passed before us like the lightning's flash: the quicker that they were old thoughts—things familiar from experience. We were conscious that the stratagem of our enemy had increased the peril of our situation; but we thought not yet of yielding to despair.

In an instant we had altered our relative positions. The three of us no longer fronted in one direction, but stood back to back—each to guard the third of the circle before his face. Thus stood we, rifles in hand.

The five horsemen were not slow in the execution of their manœuvre. Once or twice they galloped round us in a wide circle; and then following a spiral curve, drew nearer and nearer. When within carbine range, each fired his piece; and, retreating outward upon the main body, hastily exchanged his empty gun for one that was loaded, and galloped back as before.

In the first volley, most of their bullets, discharged at random, had passed over our heads. We heard them hissing in the air high above us. One, however, had been better aimed, and struck Rube's mare in the hip, causing the old mustang to squeal and kick violently. It did but little damage, though it was an earnest of what we might expect; and it was with increased apprehension that we saw the horsemen come back on their circling career.

You will wonder why we did not return their fire? Our guns carried as far as theirs. Why did we not use them, while the horsemen were within range? Not one of the three of us thought of drawing a trigger! You will wonder at this? It requires explanation.

Know, then, that the five men who galloped round us were five of the best horsemen in the world—no doubt the picked riders of the band. Not in Arabia, not in the hippodromes of Paris or London, could they have found their superiors—perhaps not their equals, for these men literally lived in the saddle. Each, as he approached the dangerous circle covered by our rifles, disappeared behind the body of his horse. A boot and hand over the hollow of the deep saddle-tree, perhaps a hand grasping the wither-lock of the horse, were all of the rider that could be seen. Presently a face might be observed, suddenly veiled by a puff of smoke from the carbine, and then ducked instantly out of sight. Perhaps the barrel of the piece might be noticed glancing along the horse's counter, while the stream of fire pouring forth, told that the rider had taken aim under the throat of his steed, the latter all the while going at full gallop.

During these manœuvres, sharp shots as my comrades were, and fair marksman as I was myself, there was no instant when we could have hit any one of the five horsemen. It would have been easier to have brought down a bird upon the wing. Their horses we might have killed or crippled, but that would not have repaid us for the risk of an empty rifle. We dared not waste a bullet on the horses. This, then, was our reason for reserving our fire.

Do not fancy from this my prolixity of explanation, that we were so slow in comprehending all this. No, we understood our situation well enough; we knew that to discharge our pieces—even though a horse should fall to every shot—was just what the enemy desired. That was the main point of their ruse; but we were too well used to the wiles of Indian warfare to be beguiled by so shallow an artifice. Words of caution passed between us, and we stood to our guns with as much patience as we could command.

It was tempting enough—provoking, I should rather say—that to be fired at, without the chance of returning it; and my companions, notwithstanding their habitual coolness, chafed angrily under the infliction.

Once more the five horsemen came galloping around us, and discharged their pieces as before; but this

time with more effect. A bullet struck Garey in the shoulder, tearing away a patch of his hunting-shirt, and drawing the blood; while another went whizzing past the cheek of Old Rube, creasing his catskin cap!

'Hooray!' shouted the latter, clapping his hand over the place where the lead had wounded him. 'Close enough thet wur! Cuss me, ef't hain't carried away one o' my ears!'

And the old trapper accompanied the remark with a wild, reckless laugh. The rent of the bullet, and the blood upon Garey's shoulder, now fell under his eye, and suddenly changing countenance, he exclaimed:

'By the tarnal! yur hit, Bill? Speak, boyee!'

'It's nothin,' promptly replied Garey—'nothin; only a grease. I don't feel it.'

'Yur sure?'

'Sartin sure.'

'By the livin catamount!' exclaimed Rube, in a serious tone, 'we can't stan this no longer. What's to be done, Billee? Think, boy!'

'We must make a burst for it,' replied Garey; 'it's our only chance.'

'Tur no use,' said Rube, with a doubtful shake of the head. 'The young fellur mout git clur; but for you 'n me thur's not the shaddy o' a chance. They'd catch up wi' the ole mar in the flappin o' a beaver's tail, an yur hoss ain't none o' the sooplest. Tur no use.'

'I tell you it are, Rube,' replied Garey impatiently. 'You mount the white hoss—he's fast enough—an let the mar slide; or you take mine, an I'll back whitey. We mayent get clar altogether; but we'll string the niggers out on the parairy, an take them one arter another. It's better than stannin hyar to be shot down like buffler in a penn. What do you think, capt'n?' added he, addressing himself to me.

Just then an idea had occurred to me. 'Why not gallop to the cliff?' I inquired, looking toward the mesa: 'they can't surround us there? With our backs to the rock, and our horses in front of us, we may defy the rabble. We might easily reach it by a dash'—

'Scalp me! ef the young fellur ain't right,' cried Rube, interrupting my speech. 'It's the very idee, plum center!'

'It are!' echoed Garey—'it are! We hain't a second to lose; they'll be round us again in a squall's jump. Look yonder!'

This conversation had occupied but a few seconds of time. It occurred just after the five horsemen had the second time emptied their guns, and galloped back to exchange them. Before they could return to deliver a third fire, our determination was taken, and we had hastily undone the fastenings of our horses, and were ready to mount. This we accomplished so quietly, that it was evident the enemy had not perceived us, and therefore entertained no suspicion of our design; hence the road towards the mesa was still perfectly open to us. In another minute, however, the five riders would have been circling around us, and that would have naturally altered our situation.

'Hurry, Rube!' cried Garey—'hurry, man, and le's be off!'

'Keep cool, Billee,' rejoined Rube, who was adjusting the bridle of Garey's horse. 'Plenty o' time, I tell ee; they ain't a comin yit. Ho-woo! ole gal!' he continued, addressing himself to the mare—'ho-woo! we're a gwine to leave you ahint a bit, but I reck'n yu'll turn up agin. They won't eat ye, anyhow; so don't be skeart about thet, ole gal! Now, Billee, I'm ready.'

It was time, for the riders were again spurring forward to surround us.

Without waiting to observe further, we all three leaped simultaneously on horseback; and, plying the spur deeply, shot off in a direct line for the mesa.

A glance behind shewed us the guerrilleros—the whole band coming in full tilt after us, while their cries sounded in our ears. To our satisfaction, we saw we had gained ground upon them—our sudden start having taken them by surprise, and produced in their ranks a momentary hesitation. We had no fear of being able to reach the mesa before they could overtake us.

For my own part, I could soon have ridden out of sight altogether; so could Garey, mounted on the white steed, that, with only a raw-hide halter, was behaving splendidly. It was Garey's own horse, a strong but slow brute, that delayed us; he was ridden by Rube; and it was well the chase was not to be a long one, else our pursuers would have easily overhauled him. Garey and I kept by his side.

'Don't be afeerd, Rube!' shouted Garey, in a tone of encouragement; 'we ain't a goin to leave you—we'll stick thegither!'

'Yes,' added I, in the excitement of the moment, 'we live or die together!'

'Hooray, young fellur!' cried Rube, in a burst of wild gratitude—'hooray for you! I know yur the stuff, an won't leave me ahint, though I gin you the slip onces—when you mistuk me for the grizzly. He, he, hoo! But then, you see twur no use o' my stickin to you—ne'er a bit o' good. Wagh! them niggurs ur gettin nigher!'

We were riding directly for the middle of the mesa, whose cliff, like a vast wall, rose up from the level plain. We headed for its central part, as though we expected some gate to open in the rock and give us shelter!

Shouts of astonishment could be heard mingling with the hoof-strokes. Some of the expressions we heard distinctly. 'Whither go they?' '*Yaya!* do they intend to ride up the cliff?' '*Carrambo! van en la trampa!*' (Good! they are going into the trap!)

Shouts of exultation followed, as they saw us thus voluntarily placing ourselves in a position from which retreat appeared impossible.

They had been apprehensive, on our first galloping off, that we might be mounted on swift horses, and meditated escaping by speed; but on discovering that this was not our intention, cries of joyful import were heard; and as we approached the cliff, we saw them deploying behind us, with the design of hemming us in. It was just the movement we had anticipated, and the very thing we wished them to do.

We galloped up close to the rocky wall before drawing bridle; then, suddenly flinging ourselves to the ground, we placed our backs to the cliff, drew our horses in front of us, and holding the bridles in our teeth, raised our rifles towards the foe. Once more the three shining tubes were levelled, promising certain death to the first who should approach within range.

CHAPTER XXXIV.

RUBE'S CHARGER.

Our attitude of defence, thus suddenly assumed, produced a quick effect upon our pursuers, who pulled up simultaneously on the prairie. Some who had been foremost, and who fancied they had ridden too near, wheeled round and galloped back.

'Wagh!' ejaculated Rube; 'jest look at 'em! they've tuk care to put plenty o' paraira atween our guns an thur cowardly karkidges. Wagh!'

We at once perceived the advantage of our new position. We could all three shew front wherever the enemy threatened. There was no longer any danger of their practising the surround. The half-circle behind us was covered by the mesa, and that could not be scaled. We had only to guard the semicircle in front—in fact, less than a semicircle, for we now perceived that the place was *embayed*, a sort of

re-entering angle formed by two oblique faces of the cliff. The walls that flanked it extended three hundred yards on either side, so that no cover commanded our position. For defence, we could not have chosen a better situation; gallop round as they might, the guerrilleros would always find us with our teeth towards them! We saw our advantage at a glance.

Neither were our enemies slow to perceive it, and their exulting shouts changed to exclamations that betokened their disappointment.

Almost as suddenly, their tone again changed, and cries of triumph once more rose along their line.

We looked forth to discover the cause. To our dismay, we perceived a reinforcement just joining them! Five fresh horsemen were riding up, evidently a portion of the band. They appeared to have come from behind the mesa—from the direction of the rancheria—though, as we galloped forward, we had not observed them: the mound had concealed them from our view. Notwithstanding this accession to their strength, their courage did not appear to give by it.

Almost on the instant that their new allies arrived upon the ground, the troop filed off by twos, and deployed across the mouth of the little bay in which we had taken shelter. The movement was soon completed, and six pair of them were now ranged before us at equal distances from each other. The remaining three—Ijorra and two others—kept their places directly in front of us. In one of the latter I recognised a ruffian whom I had frequently noticed at the rancheria. He was a man of large size, and what is rare among Mexicans, red-haired; but I believe he was a *Vizcaino*. He was familiarly known by the sobriquet of *El Zorro* (the Fox), probably on account of the hue of his hair; and I had heard from good authority—that of the *alcalde himself!*—that this fellow was neither more nor less than a *salteado*. Indeed, *El Zorro* made little secret of his calling. The brigand of Mexico is usually well known to his countrymen. During his intervals of leisure, he appears in the populous town, walks boldly through the streets, and freely mingles in society. Such was *El Zorro*, one of the right-hand men of Ijorra.

The design of our enemy was now manifest: they had no intention of making an immediate attack upon us; they saw that our retreat was impossible, and had resolved to hold us in siege, perhaps till thirst and hunger should force us to surrender.

Their calculation was founded on probability. Their valour was weak, their cunning was strong and subtle.

Rube was now greatly 'out of sorts.' When he saw the guerrilleros 'fixing' themselves in the manner described, he seemed to regret that we had taken our stand there.

'We're hyur!' he exclaimed peevishly, 'an how we to git clur agin? Scalp me, Bill! ef we hed better a fit 'em on the paraira, afore we gits we wi' hunger. Wagh! I kud eat a griakin now, an good chunk o' a one. Ay, smoke away!' (some of the Mexicans had lighted their cigars, and were coughing and puffing at them)—'smoke away, durn yur! yur yellow skinned skunks! I'll make some o' ye smoke a mornin, or my name ain't Rube Rawlins. Gi's a o' bacca, Bill; maybe it'll take the edge off o' yur stummuk. Wagh! I feel as holler about the kids as my ole mar—Geehosopha! See the mar!'

The emphatic utterance of the last words caused Garey and myself to look towards the speaker, and then in the direction in which he pointed. A scout came before our eyes, that, spite the depression of the spirits, caused both of us to break into loud laughter.

The 'ole mar,' that for many long years had carried Rube over the mountains and prairies, was a creature that scarce yielded to himself in peculiarity.

She was a lank, bare-ribbed, high-boned animal, long-eared like all of her race, for she belonged to the race of Rosinante. The long ears caused her to look foolish, and at a distance she might have been mistaken for a mixed breed; but it was not so—she was a true mustang, and, spite of her degenerate look, a pure Andalusian. She seemed to have been, at an earlier period of her life, of that dun yellowish colour known as 'clay bank'—a common hue among Mexican horses; but time and scars had metamorphosed her, and gray hairs predominated, particularly about the head and neck. These parts were covered with a dirty grizzle of mixed colour. She was badly wind-broken, and at stated intervals, of several minutes each, her back, from the spasmodic action of the lungs, heaved up with a jerk, as though she was trying to kick, and couldn't. Her body was as thin as a rail, and her head habitually carried below the level of her shoulders; but there was something in the twinkle of her solitary eye—for she had but one—that told you she had no intention of giving up for a long time to come. As Rube often alleged, 'she was game to the backbone.'

Such was the 'ole mar,' and it was to her that our attention was now so suddenly called.

Having parted from her on the prairie, in the wild gallop that followed, we had thought no more of the creature, not caring—that is, Garey and myself—what became of her. Rube, however, was far from sharing our indifference as to her fate. He would almost as soon have parted with one of his 'claws' as that same faithful companion, and we had heard him expressing his hopes that no harm would come to her.

Of course, we had concluded that she would either be shot or lazed by one of the guerrilleros. It appeared, however, that this was not to be her fate just then. Resolving not to be parted from her master so easily, she had galloped after us. Being slow, she soon fell behind, and for a while was mixed up with the horses of the guerrilleros. Of course the men had noticed her, but seeing that she was a worthless brute, had not deigned to make a capture of her.

In due time she fell into the rear of the whole troop; but even that did not turn her from her original intention, and at the moment of Rube's exclamation, she was just breaking through the line of deployment on her way to join him. From the manner in which her nose was held as she ran, she appeared to be trailing him by the scent.

Seeing her pass, one of the guerrilleros dashed after to capture her; perhaps because there was an old grudge with some of Rube's traps buckled upon it. Mare, saddle, and all, were scarcely worth the fling of a lazo, and so the man appeared to think; for instead of using his lazo, he rode forward with the intention of seizing the mare by the bridle.

The feat proved not so easy of accomplishment. As the fellow bent down to grasp the rein, the old mare started one of her wild squeals, slewed her hind-quarters about, and raising her heels high in air, delivered them right upon the ribs of the Mexican. The heavy 'thud' was heard by all of us; and the man tumbled from his saddle, and fell to the ground—to all appearance badly hurt, and most probably with a pair of broken ribs.

The squeal of the mare was echoed by a shrill laugh from the throat of her delighted master; and not until she had galloped up to him, did he cease to make the rocks ring with his wild cachinnations.

'Wa-hoo—woop! yur thur, ole gal!' he shouted as the animal halted before him. 'You gin 'im a sock-bellower—you did. Yeeup! ole blueskin! yur welkum back! an ye've foteched my saddle too! Hooray! Ain't she a beauty, Bill? She's wuth her weight in beaver-plew. Wag! that 'ee ur, ole beeswax! Kum byur this away—thur now!'

And the speaker proceeded, after some more

apostrophising, to draw the animal closer up to the cliff, placing her body as an additional barricade in front of his own.

Our involuntary mirth was of short duration; it was interrupted by an object that filled our hearts with new apprehension.

THREE CHAPTERS OUT OF MY LIFE.

WRITTEN BY UWAROWSKIJ OF YAKUTSK, FOR THE NOBLE LORD OTTO NIKOLAJEWITSCH.

[This is a translation from the only written specimen of the Yakut language, which, though spoken throughout a large portion of the Russian dominions, has hitherto remained entirely oral. The above-named Uwarowski—a *bona-fide* personage—states, in the introduction to his work, that he undertook the task of reducing this, his native tongue, to letters, at the request, and with the assistance, of his patron Nikolajewitsch. The odd mixture of simplicity and shrewdness evidenced therein, throws a curious light upon the modes of life and thought in a region so far removed from European civilisation.]

CHAPTER I.

ON the left bank of the river Lena, one hundred *kos* from the town of Yakutsk, and near the Arctic Sea, is, or rather was—for it exists no longer—a place called Shigansk. Here lived my father, who was commander of the district; and here I was born.

I remember little or nothing of Shigansk, for my father returned to Yakutsk when I was scarcely five years old. One summer morning, however, I can recall distinctly, when I was almost frightened to death at the sight of a terrible man, who stood at the entrance of the house with a loaded gun in his hand. He had been placed there on guard, lest his companions, by mistake, should take our property. He was, in fact, one of a gang of fourteen or fifteen escaped convicts. They had fled from that part of Okhotsk where the salt is prepared, plundering on their way the goods of many merchants; and had gone down the Aldan to the Lena, and so come by boats to Shigansk. Arriving there at night, they found the soldiers and Cossacks asleep; so they bound them hand and foot, and made them dead-drunk; after which they put them into the prison, and locked the door; then, dividing themselves into several parties, the marauders proceeded to plunder the whole town.

On the same day, about the time when the milking of the cows begins—between nine and ten o'clock—they all assembled in our house, having finished sacking the place. I remember as well as if it were only yesterday, how these savage men without nostrils, and with blue stains upon their faces—they were branded criminals—stood warming themselves before the fire, the blood of those whom they had murdered yet steaming from them. My father and mother were standing by; they had quickly overcome their terror, like sensible people, only too thankful for their safety so far.

I remember how the robber-captain took me upon his knee, and gave me sweet things as I sat there crying. He was a Georgian by birth, a man of enormous stature; he had all kinds of weapons hanging to his girdle, and wore scarlet leggings ornamented with silver down the seams. He and his band ate an enormous breakfast; and about mid-day, taking their rich booty with them, they sailed away down the Lena.

It is impossible to describe the lamentations of our neighbours. There were about thirty families in the town; and at night, when they returned from the forest, to which they had fled, they found their houses ransacked—in a word, cleared out from top to bottom.

During the same summer—but I do not remember

how many months later—the soldiers and Cossacks who had come from Yakutsk, overtook the robbers seventy kōs from Shigansk, and after a fierce resistance, killed nearly every man of them: but the stolen property was never recovered.

Shigansk is wanting in every beauty and variety which can charm the eye. The character of the country is this: a slip of land between two mountains, surrounded by a wood so thick that a dog would not find room to push his nose into it; besides which, as soon as you have gone about ten steps, you sink up to the knees in soft rotten mould. The following are the only kinds of berries to be found in it: bilberries, black bilberries, red currants, and hips and haws.

The winter lasts for eight months; and during that time, people never take off their warm clothing. Two months are expended between spring and autumn; and thus, out of the whole year, only two months remain for the poor summer. In winter, the snow falls higher than the house-tops; the wind blows fiercely, so that it is impossible to keep upon your feet. The cold freezes your very breath; and during two of the winter months, the eye of man never looks upon the sun.

To speak the truth, if my will had been consulted in the matter, I would by no means have chosen Shigansk for my birthplace. Its inhabitants are Tungousses, and they number from four to five hundred. These people live by the chase, wading through the sea of snow round about Shigansk to a distance of more than two hundred kōs.

The animals they hunt are the wild reindeer, the black fox, the sable, the fox with the dark-coloured throat, the red fox, white fox, squirrel, ermine, black bear, and white polar bear. Fossil mammoth tusks are likewise eagerly sought by them. No country is without some kind of beauty; you may find it even in Shigansk during the two summer months, when the sun never sets. Nor is any land without its peculiar plenty. Thus, the rivers about Shigansk are swarming with delicious fish: salmo nelma (a kind of salmon trout), bleak, sturgeon, sterlet, tschir (a kind of salmon), muksun, omul, salmo lavaretus, and countless more. All these are spoiled and wasted; first, for want of salt, and then through a country usage. The Tungouse digs a hole, about a fathom in depth, near the place where he has taken his fish. He covers the sides of it with bark, and spreads bark also over the bottom. Then, after having cleaned and taken out the bones of his fish, he presses them down into the pit, filling it as full as possible. They lie here until they are blue and putrid, and then become a favourite food of the Tungousses. I must confess, that in my childhood I ate it with great relish, and would eat it even now, if I had any.

On the day of my departure from Shigansk, I took, according to the custom of the time, a bladder full of earth from my birthplace, in order that, when I suffered from the home-sickness, I might mix it with water, and drink it. However, fortunately, I have never felt this disorder, and so have never been obliged to fill my stomach with black earth. From that time until now, I have not once entered Shigansk. God only knows whether I shall ever again see the place of my birth.

Two kōs and a half to the north of Yakutsk there is a place called Killām. Here my father and mother had built a pretty Russian house, in which they lived before they went to Shigansk. Close to them, but in a separate house, lived my mother's parents. At that time, I had never seen a broad field or an open plain; I had seen only the bright foliage of the water-hemlock, spreading over a wider surface than the eye can travel, or growing for miles and miles by the river-side; or else rocks and hills covered from base to summit with thick impenetrable woods. I had never heard the

lark's song, or the voice of a singing-bird; I had listened only to the cries of the raven and crow, and now and then to the piping of bull-finches. The only grass I had ever seen was the scentless reed-grass. You may imagine, therefore, how great was my astonishment when I reached Killām. An open meadow more than a kōs in breadth, and several kōs in length met my eyes; the air above me trembled with green glittering, that was even like the surface of the water. The variety of the flowers, and their great number, gave to the land the appearance of being overspread by a green or yellow garment. Here as there were thick groves of larch and birch. A rapid stream flowed through the middle of the meadow and towards the bright sands of a broad river, bordered with black and precipitous banks. Thick rich meadow grass grew on the further side of the river, and on the plain the scythes of hundreds of mowers glittered in the sunshine. Horses and cattle without number were grazing on the broad expanse of the meadow, feeding nothing, and wandering about at will. Five or six mud-plastered Yakut cottages, and some large white shining conical summer *yourtes*, stood out as if in picture. The windows of these *yourtes*, of mica or glass, shone like jewels in the distance, from our house which stood boldly out on a considerable elevation above the plain.

No sooner were we settled at Killām, than misfortune fell upon us. My father had never known a day of illness until he was in his seventy-second year; the one day at dinner-time, he fell senseless upon the bench; and before an hour had passed, he gave up his soul to God. My mother's sorrow was beyond all bounds; and indeed it could not well be otherwise, for she had lost the husband with whom she had lived upwards of forty years in the most perfect harmony. After my father's burial, my mother found herself in very straitened circumstances. There were left remaining to the amount of 800 or 900 roubles, which was then accounted a large sum. They had lived in Shigansk for nine years, and found on their return to Killām but a very small number of the cattle which had been left there; the greater part of them had been lost through the mismanagement of strange hands, and the house had stood empty so long, that it was going to ruin.

The time was approaching when I must manage to get a little learning: for this purpose, it was necessary that we should live in the town; but we had no house there. All these things together troubled my mother greatly; but, nevertheless, they did not draw her attention from business. And now, do not blame me for saying a few words about this good mother. She could neither read nor write, and yet she was a woman of considerable talent. She had the most remarkable memory I ever heard of; she remembered everything that had happened from the time she was four years old, and she never forgot a single thing that she had heard from that time until she was seventy. She would tell you without a moment's hesitation, the day on which every festival in the year fell; she knew all about the governors who had lived a hundred years ago; and if she had calculated the addition or division of ever so large a sum of money, she would tell you the result without a fault. People who had forgotten any circumstance or event, constantly came to her to settle their disputes. She knew the national traditions, fables, songs, and riddles—indeed everything, down to needle-work.

She was a very godly woman: to the day of her death, she had never spoken an untrue word, neither had any hungry man ever left her house without being filled. In consequence of this, she was respected as a good woman, and one who had an unfeigned love of truth. Whoever had deceived her, was ashamed to acknowledge his guilt, and whoever had gratified

by any good deed or any service, considered himself fortunate from that day.

No one dies with the dead; the living feels with the living. So, after my mother had got over her first grief, she began to put the house in order, and then during the five years in which we lived at Killām, she occupied herself in restoring the cattle to their original number.

Our life at Killām was a very dull one. During five months in the year, the cold was so great that we could not get out. In the morning, my grandfather taught me to read and write; in the evening, I used to read the Holy Scriptures to my mother, or she would instruct me to love God, to honour the emperor, to care for the poor, to be compassionate, to do no wrong to any man. In short, she endeavoured to train me to that course of action which the word of God says it is our duty to follow. And in consequence of my great love to my mother, and of my natural disposition, I listened with reverence to every word she said.

About this time, we became acquainted with many of the inhabitants of Yakutsk, who afterwards loved me as their own child, and whom I loved with my whole heart. It was thus that I learned their language thoroughly, and made myself acquainted with their mode of life and thought. I also listened eagerly to all their tales, songs, riddles, and traditions; went gladly to their festivals, wedding-feasts, and national assemblies, and took part in the games which they celebrate in summer. It was thus I learned to excel in all their sports. I was renowned as a good shot, either with the gun or the Yakut bow, and received much praise for the manner in which I would mount a wild-horse, and make it fly like the wind across the broad plain. By certain signs about a horse, I could speak with decision as to its strength, speed, spirit, and temper; and at the very first sight of horned cattle, I could tell their value.

During the summer months, the lakes of this region abound with different kinds of water-fowl; in the woods and forests, hares, black-cock, partridges, and the hazel-hen, are very plentiful.

The geese, ducks, swans, cranes, storks, and different kinds of small birds make so much noise, that in spring when the ice breaks up, and in winter when their young are fledged, and they fly away to warmer lands, it is impossible to get any sleep for them.

I suppose there are few men who have killed so many birds as I have from my eleventh or twelfth year upwards. I had such a love of sport, that a journey of three days without sleep was no exertion, or I never knew what it was to feel weary. In autumn, when waiting for dawn, I have often slept on the damp earth, the trunk of a tree for my pillow, and without any extra covering, while the wind blew, and rain and snow were falling. Or when fishing, I have often waded the whole night in cold water on the banks where the nets were set out.

In later years, it has been very useful to me thus to have been early accustomed to exercise and exertion. In this manner, time passed on, but at length it became necessary for us to reside in the town; so my mother had our house at Killām taken down, and removed to Yakutsk, where it was again erected in a good position which she herself had chosen.

In my sixteenth year, I obtained a situation as one of the Imperial Corps of Writers in the Upper Court of Yakutsk. A man of the name of N— N— was at the head of this office. He was of low origin, and knew very little of the present style of writing, and yet he was looked upon as indispensable; and whilst he enjoyed such good-fortune, he would scarcely give other men a few kopeks for their labour. By his command, we sat daily, and wrote without intermission nine hours, from early morning until mid-day, and eight hours from mid-day until night, making

altogether seventeen hours. For this labour, we were paid one or two copper roubles* a month.

After being in this situation for about two years, I became senior clerk of my table; and in the third and fourth years, the direction of six tables was given to me. Besides this, I was, shortly after, appointed private secretary to the governor. About ten persons were appointed to help me in the discharge of all these onerous duties: one-half of them consisted of young children, who were placed under me for instruction; the other half were confirmed drunkards. In consequence of this, there was no end to my work, and I had to labour for twenty hours a day. My salary at this time was five copper roubles a month. The love of my superiors, the esteem of all men, and, above all, my mother's joy, gave me strength; moreover, I had the consciousness that my labour was not in vain.

My mother had buried twelve children, and also her beloved husband, and now she lived but for me. Just as I was thus rejoicing her heart, and at the time when she should have rested from her labour, she was attacked by a terrible and fatal disease, which increased from day to day, and confined her to her bed for two whole years. During all this time, I never allowed any one else to wait upon her for a single night; I gave her medicine and food, moved her in bed from side to side, did everything for her with my own hands, and slept in a chair by her bedside. Very frequently I passed a sleepless night, and then went to the office.

At last her strength began to diminish visibly. I was with her for nine whole days and nights before her death, and during that time I never once left her side, and never closed my eyes in sleep. Her parting words to me during these nine days were many, very many. The night before her death she said: 'Do not stay in the town of Yakutsk; it is full of envious Russians. The Yakuts love you, and will always love you: this will give birth to envy, which, taking root, will grow until you are obliged to defend every word you say, until your freedom is fettered, and you are brought to misery. Sell your house, therefore, and your goods, and go to Russia; there you will see the glorious emperor, and then your fortune will be made. You will be left all lonely under the sun; but you know my heart. Do not wander away from the good path; and then, whatever misfortune may befall you, you will be happy. Forget not to help your fellow-men, for all men are of one family, and have one Father in heaven. In the morning, I shall die: when the sun rises, send for the priest, and call together my relations and friends.'

On the following morning, so soon as the day began to break, I sent for the priest. My mother confessed her sins, received the Lord's Supper, and took leave of all the friends who had by that time assembled at my summons. Then she embraced me, and I felt her cold dying breath on my shoulder. After a few moments, all who were present said, with one voice: 'She is dead!' It was so. As she lay there on her bed, she never looked like a dying person; not one feature of her countenance had changed, and there was no difference between her death and the light sleep of one who is weary. We watched her countenance without the least fear; there was a smile of joy upon it, as if the dear mother were made glad by the sight of a seat prepared for her in that bright region where the great God dwells, and as if the soul that was purged from sin rejoiced to quit the worn-out body. This was the way in which she died.

Good mother! Of all the days that thou didst live here under the sun, not one passed without care: thine was no easy life; thy happiness consisted solely in good

* The copper or paper rouble, or rouble banco, is a quotation of fees according to an obsolete coinage, like those we make in guineas; the copper rouble is two-sevenths the value of the standard or silver rouble, which is worth from 3s. 6d. to 3s. 8d.

deeds. For these thy good deeds thou wilt be made happy now. With my mother, I lost my only joy on earth. I have neither brothers nor sisters, nor have I ever married; so that from that time until now there has been no one to mourn over my dark days or to rejoice at my good-fortune. I am a stranger to all men, and I enter every house as a guest. There was now nothing of any interest left for me in Yakutsk.

It is true the governor loved me as his own son. I was at the head of his office, and far from allowing me to go to another town, he would not let me leave him for a single hour. But he died; and so soon as he was dead, I went to Irkutsk, having first sold my house and property, and paid the debts which had been owing since my father's death. Here I obtained a situation in the governor's office, and lived in peace for a year and a half. My salary was eighty roubles a month, and I had no other duties and cares than the light ones of writing.

FEVER-POISONS.

[On the subject of scarlet fever, which has been lately making extraordinary havoc among old and young, the following useful observations occur in a small tract intended for popular dissemination by Mr R. Fairman, surgeon, Biggar.]

AFTER referring to the value of thorough ventilation, light, and cleanliness, in order to disinfect clothes and apartments from the invisible air-poison exhaled from the sick, the author proceeds:—It is important to know regarding infection, that when not destroyed or dispersed in the sick-room, it attaches itself and adheres with great tenacity to all articles of furniture—chairs, tables, drawers, &c., nestling in their innumerable pores; and unless these articles be scrubbed with a solution of chloride of lime, or exposed to a strong heat, or a free current of air for several hours, it may again become evolved, *more virulently than at first*, after the lapse of many weeks. But it chiefly adheres to cotton and woollen materials. The patient's body-clothes and blankets become saturated with it, like a sponge with water. And in airing these materials, a mere passing breeze is not always sufficient to carry it away. A genteel country family lately related to me that a few years ago they had occasion to reside some time in Edinburgh; while there, one of the domestics became affected with fever of a peculiar type. After her recovery, the bed-clothes—as was thought—were sufficiently aired, packed up, and conveyed home along with the family. Through some inadvertence, they remained for four months thus folded up; after which, being required for use, they were opened out and washed. Within a week, the person who washed them became attacked with the same type of fever, though none was prevailing in the district at the time; so that infection thus imprisoned in a blanket, or anywhere else, and not exposed to any current of air, seems not only quite indestructible, but, while thus confined, probably grows in virulence every day. Thus the infection of plague—which is just a form of typhus fever—has been packed up in a bale of cotton, and after being conveyed many hundred miles, struck with instant death the person who unloosed it. The following curious and dreadful incident, related by Dr Parr of Exeter, shewing how plague was once disseminated in an English town, we extract from Macaulay's *Dictionary of Medicine*: "The last plague which infested the town in which we now write," says Dr Parr, "arose from a traveller remarking to his companion, that in a former journey he had the plague in the room where they sat. 'In that corner,' said he, 'was a cupboard where the bandages were kept; it is now plastered, but they are probably there still.' He took the poker, broke down the plastering, and found them. *The disease was soon disseminated, and extensively fatal.*"

The next point requiring notice is, that one man may convey infection to another, while he himself escapes the disease. Some years ago, I received a message from a much esteemed and worthy minister, requesting a visit to two of his children. On arriving, I found them ill with scarlatina;

and as they had both become suddenly affected at the *same hour* the previous evening, it was evident that he had simultaneously imbibed the poisonous dose. But a question arose: Where could they possibly get infected for they had ever been carefully tended by their mother, come in contact with nobody but members of the family, and no fever of any description was prevailing for several miles around. At length the father remembered that about a week before he had visited a little girl under scarlatina in an adjoining parish; had, in the act of engaging in religious conversation, sat by her bed, taken her by the hand, rubbed his clothes on the bed-clothes of the patient in a word, had quite unconsciously done everything likely to saturate his own clothes with infection; after which the night being cold, he wrapped his great-coat first around him—thus inadvertently preventing its dispersion—mounted his horse, and trotted home at a rapid pace. Reaching home, he threw off his great-coat, drew in his chair to a comfortable fire, and as any fond parent would be apt to do, forthwith got both of the children perched upon his knee, little dreaming of the poisonous presence of his father's love was unconsciously bestowing. That this mode of communicating the disease was evident to the process of exact calculation; for the infection of scarlatina lurks in the blood about five days before the fever sets in itself; and on calculating five days back from the onset of the fever, we were brought exactly to the time of the incident occurred.

If two pieces of cloth of the same material, the one black, and the other white, were, in equal circumstances and for the same length of time, exposed to infection, the black cloth would be far sooner saturated with it than the other. We have here something analogous to the well-known law about the absorption of heat. Dark objects absorb heat more powerfully than light ones, so do they also more readily absorb infection, of all kinds of smells. Hence the mere fumigation of churches and wynds in epidemic seasons is not enough; they afterwards very properly whitewashed. Hence also the wholesomeness of light as well as air in the dwelling of the poor, and of all those measures of cleanliness and comfort which the whitening-brush is able to impart. The haunts of infection realise those conditions with which childish fancy clothes the haunts of spectres. Dark, cheerless are its favourite dens. The "bleering ingle, the clean hearth-stone," it seems to shun; but lurks in the gloomy hovel, fattens on its dirt, and in the crevices of its smoked and dingy walls finds those congenial nestling-places which it cannot find in plastered, whitewashed, smooth, and shining walls of cleanliness. Its fittest emblem is that mysterious and deadly nightshade, which loves the darkness more than the light, and luxuriates less abundantly in sunlight than in gloom.

SONNET.

BY CALDER CAMPBELL.

THE loved are never lonely: round them still
The air is rife with spiritual essences,
Whose hauntings—as about sweet flowers the bees—
Pay musical obeisance, and fulfil
Fond tasks and welcome, though invisible.—
Nor are the loving lonely: like far seas
Where man is not, yet living things the breeze
And pregnant wave inhabit, they have shed
Deep in their hearts, how'er remote from life,
Images of the absent and the dead,
And therefore know not loneliness! Alas
For him who loves not, is not loved—the strife
Of aimless action only his! To pass
O'er Earth, like frivolous words forgotten soon as said

THE SPAN OF LIFE.

THE fashion is to moralise on the speedy metamorphosis of the muling and puking child into the lean and slippered pantaloon. The swift and merciless approach of death, kicking at the door of cottage and palace with impartial foot, and interrupting alike the plans of the governed and the governor, the ignoramus and the scholar, is often dwelt upon with something like affectionate pathos, not unfrequently in a tone of querulous reflection. Mr Growler, a very worthy and practical gentleman, embodies his sentiments somewhat in this fashion: 'Threescore years and ten are equivalent to forty and odd years of self-consciousness, representing my twenty and odd years of activity. When this short period has elapsed, the spring of life has run itself completely down. If native centrifugal energy keep the machine moving yet a little while, it jerks and creaks like a rusty fly-wheel.' A plaintive statistician perchance adds, that the term of life mentioned by the psalmist, and adopted by Mr Growler, is considerably over the average derived from the tables of mortality. The poets, with grand parade of metaphor and trope, flourish of mournful trumpets, and wailing of Æolian lyres, follow in the wake of the same idea; and so sentimental humanity makes capital of the evanescence of life. It may be worth while to inquire how far this reflection is philosophically correct and practically useful.

Things temporal must ever shrink into nothingness in the presence of things eternal. The solemn voice of religion warns us of the infinite expanse lying beyond finite time, and of the infinite possibilities folded in the breast of the future. Yet we may reasonably question, whether the grave import of this warning would be lessened to contemplative minds though the span of mundane existence were lengthened to five hundred years. Let us imagine such an order of things to exist, and that our friend Mr Growler has reached his grand climacteric of four hundred years, and is engaged in meditation on the fleeting nature of sublunary things. Is it not likely that the decline of life would appear to him precipitous and sudden, and the slopes of memory terribly foreshortened in the mental review? Without much strain upon the fancy, we may suppose that Methuselah in his green old age sometimes mourned over the premature decease of a contemporary cut-off in the flower of youth at the age of fifteen score years, after a lingering illness of rather more than a century. Whatever the given term of human life might be, the boundless margin of darkness lying around it, and the doubtful eventualities of

pestilence and disease, would still render needful the illumination and solace of religious faith.

In actual life, we do not find men much impressed with the brief duration of their probable career. The jubilant spirit of youth, and the calm strength of manhood, are tempered by the uncertainty rather than the brevity of existence; and trustfulness so moderates even this sense of uncertainty, that it does not interfere, in healthy minds, with the steady and laborious pursuits of earthly aims, although it is sufficient to furnish food for reflection, and stimulate to a holier purpose. The Supreme Will has thus ordained with beneficent intention, for history teaches us that the assurance or strong probability of untimely dissolution operating on large communities of men, is the reverse of beneficial to their moral and religious nature. The plague of Athens in the classic era, and that which desolated the cities of Europe in the middle ages, afford this lesson. In the pages of Thucydides and Boccaccio, is ample proof that the result of such a feeling is moral disorganisation and reckless despair. The wisdom of faith becomes supplanted by the shallow philosophy—'Let us eat, drink, and be merry, for to-morrow we die.' But in a normal state, such a presentiment does not predominate. The child regards life as of vague, indefinite extent; youth is confident of a sufficient career; and the patriarch, reposing on his honours, and receiving the reverence of a new generation, still hopes to add more years to the winter of his age. The uncertainty of life, and the certainty of death, operate, independently of the rapid efflux of time, to teach humility to the human heart.

Strictly speaking, however, life is incommensurable with length of days and the flight of seasons. We do not sail over life's solemn main with the uniform velocity of an astronomical rotation. If the log be thrown over from time to time into the current of life, we shall observe great variation in the number of knots per hour that we make; and in order to determine the space traversed, we must calculate the rate of progress as well as the duration of the voyage. How much of our course do we pass over in half an hour? It may be, we float but lazily upon the sluggish waters; it may be, we bound along before the breeze of passion. Half an hour waiting for the train, half an hour in the society of a brilliant woman, half an hour on the eve of battle, half an hour with a guilty conscience, half an hour with the reward of virtue, half an hour with half a hundred other thoughts, persons, and things, cannot be reckoned as equal elements of what we call our life. We might as well estimate quantity of electricity by the duration of the lightning's flash, or the cubical contents of ocean by the beating of the

surge. Days are but the ripples of the sea of life, and years its long heaving swells.

The astronomical clock does not mark the epochs of existence, else why should we 'count the gray barbarian less than the Christian child.' The truth is, time is no more a correct measure of life than of light, heat, or magnetism. It measures the duration of an external phenomenon with reference to other phenomena also external, but not with reference to subjective feeling. Neither the quantity nor quality of our vitality can be estimated by the lapse of time. Life can only be rightly measured, in quantity, by the succession and number of ideas; in quality and intensity, by their nature and degree. Estimated by this rule, which of them shall we say has lived the most—Milton or Methuselah, Newton or Old Parr, Shakspeare or Jenkins, Alexander von Humboldt or the eldest of the last list of centenarians recorded by the *Blankshire Chronicle*? A modern writer has remarked on the immense amount of thought that soft pulpy mass we call the brain can secrete before its functions cease. Fancy how many folio volumes, double-columned, and in diamond type, would be filled, were we to note down—which Heaven forbid!—the rank and file of ideas, good strong lusty notions, too, that have passed through the cranium of John Smith for the last twenty years! We wish some savant, of an arithmetical turn, would calculate the number of years which would glide away in a persevering endeavour to catalogue, according to the concise method, the thoughts of an average octogenarian. The letter A of such an inventory would outrival its renowned namesake of the British Museum. All the labours of Hercules would be light as a lady's crochet-work, compared with the enormous enterprise. It is the boast of sanitary reformers, and not without justice, that the average duration of human life in this country has been augmented of late years by better air, food, dwellings, and apparel. We may fairly congratulate ourselves on the fact, although the work of amelioration is as yet only half accomplished. The genius of disease, avoiding the light of science, skulks in our lanes and alleys, and, with God's help, shall be ultimately caught in a *cul de sac*, and restrained with the bounds of His divine authority. We ought to be thankful for what has been achieved; but, at the same time, not disguise from ourselves that the earthly sum of human life is enhanced infinitely more by better mental culture, ready access to hoarded wisdom, rapid and facile interchange of thought, than by the addition of a few uncertain and weary years to the lease of existence. Sanitary improvements supply, as it were, oil to the wheels of life and polish to their centres, or remove obstacles to their free motion, and the wear and tear of the material are thereby diminished; whereas improved culture may be likened to improved machinery. It is the spiritual power-loom by which ideas are fabricated and multiplied with wonderful speed and at inconsiderable cost, while a comely and tasteful pattern is woven into the web of life for the raiment of the soul.

'Art is long, and life is fleeting.' True, Mr Poet, and yet what a spacious edifice of art, science, and learning may be raised in this fleeting life! The mantle of his ancestors does not yet hang too loosely on the stalwart limbs of Prince Posterity. Genius in its hot youth is still able to foray beyond the frontiers of actual knowledge, and bring in spoils from the darkness. The vast amount of good or evil that a short-lived, evanescent mortal can achieve before he passes away, is a continual testimony against grumbling and discontent about the trivial duration of our pilgrimage. Those whose hours are cast away and bear no fruit, will certainly find the term allotted to them brief enough; but if any man labour with a true heart and high purpose, he will

generally find, whatever may be his vocation, ample opportunity to accomplish the beneficent ends of his being. Only prodigal and thriftless servants need be reminded how few are the hours of day that remain to them ere the night cometh. If we use a wise economy, thirty years of good energetic action are no mean appanage. There is space enough, Heaven knows, for all industriously 'working in the walls of Time' to build for the indwelling of virtue a temple of good works, or, for its charnel-house, a pyramid of hideous iniquity. What matters it if life be but for a moment, when that moment can contain so much? Why, when a spirit has passed behind the curtain, do we inquire how many years did he wear his mortal coil? Let our question rather be, how much or how little did he live? After all, the heroes of history, thinkers and doers, are not remarkable for longevity. There is no time to waste, but plenty of time to labour, so let every man proceed cheerily on his journey of life, 'without hurry, without rest.'

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXXV.—EL ZORRO.

THE new object of dread was a large gun, which had been brought upon the ground by one of those lately arrived. In all probability, it belonged to El Zorro, as it was in his hands we first observed it. It appeared to be a long musket, or elephant-gun, such as the 'roers' in use among South African hunters. Whatever sort of weapon it was, we soon found to our annoyance that it pitched an ounce of lead nearly twice as far as any of our rifles, and with sufficient precision to make it probable that, before the sun had set, El Zorro would be able to pick off our horses, and perhaps ourselves, in detail. It would be half an hour before darkness could screen us with its friendly shelter, and he had already commenced practice. His first shot had been fired. The bullet struck the cliff close to my own head, scattering the fragments of gypsum rock about my ears, and then fell, flattened like a Spanish dollar, at my feet.

The report was far louder than that of either carbine or escopette; and an ejaculation from Rube, as he saw the effect of the shot, followed by his usual ominous whistle, told that the old trapper was not disposed to make light of this new piece of ordnance. Neither was Gary. His look testified to what all three of us were thinking—which was, that this mode of attack was likely to put us in a more awkward dilemma than we had yet been placed in. El Zorro might shoot us down at his leisure. With our rifles, we could neither answer his fire, nor silence it. Our peril was obvious.

The saltador had delivered his first shot 'off hand,' for we had seen him level the piece. Perhaps it was fortunate for us he had not taken aim over a 'lean,' but fortune from that source was not going to favour us any farther; for we now observed Ijurra stick two lances obliquely in the ground, so as to cross each other at a proper height, thus forming as perfect a rest as marksman could have desired.

As soon as the gun was reloaded, El Zorro knelt behind the lances, placed his barrel in the fork, and once more took aim.

I felt satisfied he was aiming at me, or my horse. Indeed, the direction of the long dark tube would have told me so; but I saw Ijurra directing him, and that made me sure of it. I had little fear for myself.

was sheltered sufficiently, but I trembled for the brave horse that shielded me.

I waited with anxious heart. I saw the blaze of the priming as it puffed upward; the red flame projected from the muzzle, and simultaneously I felt the shock of the heavy bullet striking upon my horse. Splinters of wood flew about my face; they were fragments of the saddle-tree. The ball had passed through the pommel, but my noble steed was untouched! It was a close shot, however—too close to allow of rejoicing, so long as others of the like were to follow.

I was getting as 'riled' as Rube himself, when, all at once, a significant shout from the old trapper drew my attention from El Zorro and his gun. Rube was on my right, and I saw that he was pointing along the bottom of the cliff to some object in that direction. I could not see what it was, as his horses were in the way; but the next moment I observed him hurrying them along the cliff, at the same time calling to Garey and myself to follow.

I lost no time in putting my horse in motion, and Garey as hastily trotted after.

We had not advanced many paces before we comprehended the strange behaviour of our companion.

Scarcely twenty yards from where we had first halted, a large rock rested upon the plain. It was a fragment that had fallen from the cliff, and was now lying several feet from its base; it was of such size, and in such a position, that there was ample space behind it to shelter both men and horses—room for us all!

We were only astonished we had not observed it sooner; but this was not to be wondered at, for its colour corresponded exactly with that of the cliff, and it was difficult, even at twenty yards' distance, to distinguish it from the latter. Besides, our eyes, from the moment of our halting, had been turned in another direction.

We did not stay to give words to our surprise; but hurrying our horses along with us, with joyful exclamations we glided behind the rock.

It was not an echo of our joy, but a cry of disappointed rage, that pealed along the line of the guerrilla. They saw at once that their long gun would no longer avail them, and both Ijurra and his marksman were now seen dancing over the ground like madmen. El Zorro's *métier* was at an end.

A more perfect 'harbour of refuge' could not have been found in all prairie-land. As Garey alleged, it 'beat tree-timber all hollow!' A little fortress, in fact, in which we might defy even twice the number of our assailants—unless, indeed, they should wax desperately brave, and try us hand to hand.

Our sudden disappearance had created a new sensation in their ranks. From their shouts, we could tell that some of them regarded it with feelings of wonder—perhaps with emotions of a still stronger kind. We could hear the exclamations '*Carrai!*' '*Carrambo!*' with the phrase '*los demonios!*' passing from mouth to mouth. Indeed, from the position which they occupied, it must have appeared to them that we had gone into the cliff! The separation of the rock from the wall behind it was not perceptible from the plain, else we should have perceived it as we rode forward.

If our enemies knew of this outlying boulder, it was strange they had left the way open to so safe a retreat—strange, since it did not correspond with the cunning they had otherwise given proofs of—and yet stranger they should be ignorant of its existence. Most of them were natives of this frontier, and must have frequently visited the mesa, which was one of the 'lions' of the district. Perhaps they had never troubled their thoughts about it. There is no people who take less interest in the rare features of their beautiful country than the Mexicans. Nature charms

them not. A Mexican dwelling with a garden around it is a rarity—a lawn or a shrubbery is never seen; but indeed nature has bounteously supplied them with all these. They dwell amidst scenes of picturesque beauty; they gaze over green savannas—down into deep barrancas—up to the snow-crowned summits of mighty mountains—without experiencing one emotion of the sublime. A tortured bull, a steel-galved cock, Roman candles, and the Chinese wheel, are to them the sights of superior interest, and furnish them with all their petty emotions. So is it with nations, as with men who have passed the age of their strength, and reached the period of senility and second childhood.

But there was another, and perhaps a better, reason why none of our adversaries should be intimate with the locality. As my companions alleged, the spot was a favourite halting-place of the Comanches—they have an eye for the picturesque—but perhaps the existence of a spring that was near had more to do in guiding the preference of these 'lords of the prairies.' The mesa, therefore, had for years been dangerous ground, and little trodden by the idle curious. Possibly not one of the heroes we saw before us had for years ventured so far out upon the plains.

CHAPTER XXXVI.

A PLAN OF ESCAPE.

If our enemies were awed by our sudden disappearance, it was soon robbed of its mysterious character. Our faces, and the dark barrels of our rifles, visible around the edges of the white rock, must have dispelled all ideas of the supernatural. Having hastily disposed of our horses, we had placed ourselves thus—in case of a charge being made—though of this we had no longer any great apprehension; and still less as we watched the movements of our adversaries.

El Zorro continued for some time to fire his big gun—the bullets of which we could dodge as easily as if they had been turnips hurled at us—and the leaden missiles fell harmlessly at our feet. Seeing this, the saltador at length ceased firing, and with another, rode off in the direction of the settlements, no doubt on some errand.

One pair of eyes was sufficient to watch the movements of the besiegers. Garey undertook this duty, leaving Rube and myself free to think over some plan of escape.

That we were not to be attacked was now certain. We had the choice, then, of two alternatives—either to keep the position we were in till thirst should force us to surrender, or attack *them*, and by a bold *coup* cut our way through their line. As to the former, we well knew that thirst would soon compel us to yield. Hunger we dreaded not. We had our knives, and before us a plentiful stock of that food on which the prairie wanderer often sustains life. 'Horse-beef' we had all eaten, and could do so again; but for the sister-appetite—thirst—we had made no provision. Our gourd-canteens were empty—had been empty for hours—we were actually pushing for the *mesa spring* when the enemy first came in sight. We were then athirst; but the excitement of the skirmish, with the play of passion incident thereto, had augmented the appetite, and already were we a prey to its keenest pangs. We mumbled as we talked, for each of us was chewing the leaden bullet. Thirst, then, we dreaded even more than our armed enemy.

The other alternative was a desperate one—now more desperate than ever, from the increased number of our foes. To cut our way through them had no other signification than to fight the whole party hand to hand; and we regretted we had not done so when only eleven were opposed to us.

A little reflection, however, convinced us that we were

in a yet better position. We could make the attempt in the darkness. Night would favour us to some extent. Could we succeed by a bold dash in breaking through their deployed line, we might escape under the friendly cover of darkness, and the confusion consequent upon the *mêlée*.

There was probability in this. The boldest was clearly the wisest course we could pursue. Desperate it appeared. One or other of us might fall, but it offered the only hope that any of us might get free, for we knew that to surrender was to be shot—perhaps worse—tortured.

We had but faint hopes of a rescue; so faint, we scarcely entertained them. I knew that my friends, the rangers, would be in search of me. Wheatley and Holingsworth would not give me up without making an effort for my recovery; but then the search would be made in a different direction—that in which I had gone, and which lay many miles from the route by the mesa. Even had they thought of sending to the mound, the search must have been already made, and the party returned from it. Too long time had elapsed to make any calculation on a chance like this. The hope was not worth holding, and we held it not.

For some time, Rube and I thought in combination, canvassing the details of the plan that had offered. After a while, we stood apart, and each pursued the train of his own reflections.

I declare that in that hour I had more painful thoughts than those that sprung from the peril of my situation; this I solemnly declare.

I have already said, that when I first recognised the leader of the guerrilla, I experienced an unpleasant suspicion. Since then, I had not time to dwell upon it—self-preservation engrossing all my thoughts. Now, that I found more leisure for reflection, the dread doubt returned in full strength, and I bitterly pondered upon it. Need I name the subject of my wretched reflections? Isolina de Vargas!

Knew *she* of this? Knew she that Ijurra was the chief of a guerrilla? Her cousin—share of the same roof—she could scarcely be ignorant of it! Who set him on our trail? Oh, bitter thought! was the hunt of the wild-horse a *ruse*—a scheme—to separate me from my command, and thus render it an easier prey to the Mexican guerrilleros? Perhaps my straggling followers were by this cut off? Perhaps the post had been attacked by a large body of the enemy—captured? I was not only to lose life, but had already lost my honour. I, the proud captain of a boasted troop, to be thus entrapped by artifice—the artifice of a woman!

My heart, overwhelmed with such bitter fancies, stayed not to reason.

Presently followed a calmer interval, and I began to discuss the probability of my suspicions. What motive could she have to plot my destruction? Surely not from any feeling of love for her country, and hatred towards its enemies? From all I had learned, no such sentiment existed in her mind, but rather an opposite one—a truer patriotism. She was a woman of sufficient aim and intellect to have a feeling one way or the other; but had I not good grounds for believing her a friend to our cause; a foe to the tyrants we would conquer? If otherwise, I was the victim of profound deception and unparalleled hypocrisy!

Perhaps, however, her feeling was personal, not national. Was I alone the object of her hatred? Had I done sought by word or deed to call forth her antagonism—to deserve such cruel vengeance? If so, I was sadly ignorant of the fact. If she hated me, she hated one who loved her, with his whole soul absorbed in the passion. But no, I could not think that I was an object of hatred to her. Why should she hate me? How could she?

I could think of but one motive why she should make herself instrumental in the accomplishment of my ruin. It was explicable only on the presumption that she was attached to Ijurra—that Rafael Ijurra was the lord of her heart. If so, he could easily bend it to his will—for this is but the sequence of the other—could influence her to whatever act.

As for Ijurra, there was motive enough for his hostility, even to the seeking of my life. The insult put upon him at our first meeting—the knowledge that I loved her—for I was certain he knew it—with the additional fact that I was an enemy—one of the invaders—of his country. These were sufficient motives, though, doubtless, the two first far outweighed the other: with Rafael Ijurra, revenge and jealousy were stronger passions than patriotism.

Then came consolation—thoughts of brighter hue. In the face of all was the fact, that *the white steed had been found*, and captured! There stood the beautiful creature before my eyes. There was no deception in that—there could be none—no scheme could have contrived a contingency so remarkable.

Ijurra might easily have known of the expedition without *her* agency. Its result he would have learned from the returned vaqueros. He had time enough then to collect his band, and set after me. Perhaps he even knew not that he was a leader of guerrilleros! I had heard that his movements were shrouded in mystery—that mystery which covers the designs of the adventurer. He had served in the school of Antonio Lopez de Santa Anna—fit master of deception. Isolina might be innocent even of the knowledge of his acts.

I re-read Isolina's letter, weighing every word. Strange epistle, but natural to the spirit that had dictated it. In its pages I could trace no evidence of treason. No; Isolina was loyal—she was true!

CHAPTER XXXVII.

ELIJAH QUACKENBOSCH.

While these reflections were passing through my mind, I was standing, or rather leaning, with my back against the boulder, and my face towards the wall of the mesa. Directly in front of me was a recess or indentation in the cliff, carried groove-like upward, and deepening as it approached the summit. It was a slight gorge or furrow, evidently formed by the attrition of water, and probably the conduit of the rain that fell upon the table surface of the mound.

Though the cliffs on each side were perfectly vertical, the gorge had a considerable inclination; and the instant my eyes rested upon it, it occurred to me that the precipice at this point could be scaled!

Up to this moment, I had not thought of such a thing; for I had been under the impression—from what my companions had told me—that the summit of the mesa was inaccessible.

Rousing myself to more energetic observation, I scrutinised the cliff from base to summit; and more I regarded it, the stronger grew my conviction that, without great difficulty, an active climber might reach the top. There were knob-like protuberances on the rock that would serve as footholds, and here and there, small bushes of the trailing cedar hung out from the seams, that would materially assist any one making the ascent.

While scanning these peculiarities, I was startled by observing several abrasions on the face of the rock. These marks appeared quite fresh, and evidently made by some other agency than that of the elements.

After a short examination, I became convinced that they were marks made by a human foot—the scuffs of a strong-soled shoe. Beyond a doubt, *the cliff had been scaled!*

My first impulse was to communicate the discovery to my companions; but I forbore for a while—in order to satisfy myself that the person who had made this daring attempt had actually succeeded in reaching the summit.

Twilight was on, and I could get only an indistinct view of the gorge at its upper part, but I saw enough to convince me that the attempt had been successful.

What bold fellow had ventured this? and with what object? were the questions I naturally asked myself.

Vague recollections were stirring within me; presently they grew more distinct, and all at once I was able to answer both the interrogatories I had put. I knew the man who had climbed that cliff. I only wondered I had not thought of him before!

Among the many odd characters in the piebald band, of which I had the honour to be chief, not the least odd was one who answered to the euphonious name of 'Elijah Quackenboss.' He was a mixture of Yankee and German, originating somewhere in the mountains of Pennsylvania. He had been a schoolmaster among his native hills—had picked up some little book-learning; but what rendered him more interesting to me was the fact that he was a botanist. Not a very scientific one, it is true; but in whatever way obtained, he possessed a respectable knowledge of *flora* and *sylvæ*, and evinced an aptitude for the study not inferior to Linnæus himself. The more surprising was this, that such inclinations are somewhat rare among Americans—but Quackenboss no doubt drew his instincts from his Teutonic ancestry.

If his intellectual disposition was odd, not less so was his physical. His person was tall, crooked, and lanky; and none of those members that should have been counterparts of each other seemed exactly to match. His arms were odd ones—his limbs were unlike; and all four looked as if they had met by accident, and could not agree upon anything. His eyes were no better mated, and never consented to look in the same direction; but with the right one, Elijah Quackenboss could 'sight' a rifle, and drive in the nail at a hundred yards' distance.

From his odd habits, his companions—the rangers—regarded him as hardly 'square;' but this idea was partially derived from seeing him engaged in his botanical researches—an occupation that to them appeared simply absurd. They knew, however, that 'Dutch Lige'—such was his sobriquet—could shoot 'plum center;' and notwithstanding his quiet demeanour, had proved himself 'good stuff at the bottom;' and this shielded him from the ridicule he would otherwise have experienced at their hands.

Than Quackenboss, a more ardent student of botany I never saw. No labour retarded him in the pursuit. No matter how wearied with drill or other duties, the moment the hours became his own, he would be off in search of rare plants, wandering far from camp, and at times placing himself in situations of extreme danger. Since his arrival on Texan ground, he had devoted much attention to the study of the *cactaceæ*, and now having reached Mexico, the home of these singular endogens, he might be said to have gone cactus-mad. Every day his researches disclosed to him new forms of cactus or cereus, and it was in connection with one of these that he was now recalled to my memory. I remembered his having told me—for a similarity of tastes frequently brought us into conversation—of his having discovered, but a few days before, a new and singular species of *mamillaria*. He had found it growing upon a *prairie mound* which he had climbed for the purpose of exploring its botany, adding at the same time that he had observed the species only upon the top of this mound, and nowhere else in the surrounding country.

This mound was our mesa. It had been climbed by Elijah Quackenboss!

If he, awkward animal that he was, had been able to scale the height, why could not we?

This was my reflection; and without staying to consider what advantage we should derive from such a proceeding, I communicated the discovery to my companions.

Both appeared delighted; and after a short scrutiny declared the path practicable. Garey believed he could easily go up; and Rube in his terse way said, that his 'jeints wa'n't so stiff yit;' only a month ago he had 'clomb a wuss-lukin bluff than it.'

But now the reflection occurred, to what purpose should we make the ascent? We could not escape in that way! There was no chance of our being able to descend upon the other side, for there the cliff was impracticable. The behaviour of the guerrilleros had given proof of this. Some time before, Ijurra, with another, had gone to the rear of the mound, evidently to reconnoitre it, in hopes of being able to assail us from behind. But they had returned, and their gestures betokened their disappointment.

Why, then, should we ascend, if we could not also descend on the opposite side? True, upon the summit we should be perfectly safe from an attack of the guerrilla, but not from *thirst*, and this was the enemy we now dreaded. Water would not be found on the top of the mesa. It could not better our situation to go there; on the contrary, we should be in a worse 'fix' than ever. So said Garey. Where we were, we had our horses—a spare one to eat when that became necessary, and the others to aid us in our attempt to escape. Should we climb the cliff, these must be left behind. From the top was less than fifty yards, and our rifles would still cover them from the clutch of our enemies, but to what advantage? Like ourselves, they must in time fall before thirst and hunger.

The gleam of hope died within us, as suddenly as it had sprung up.

It could in nowise serve us to scale the cliff: we were better in our present position; we could hold that so long as thirst would allow us. We could not do more within the granite walls of an impregnable fortress.

This was the conclusion at which Garey and I had simultaneously arrived.

Rube had not yet expressed himself. The old man was standing with both hands clutching his long rifle, the butt of which rested upon the ground. He held the piece near the muzzle, partially leaning upon it, while he appeared gazing intently into the barrel. This was one of his 'ways' when endeavouring to unravel a knotty question; and Garey and I, knowing this peculiarity on the part of the old trapper, remained silent—leaving him to the free development of his 'instincts.'

CHAPTER XXXVIII.

RUBE'S PLAN.

For several minutes, Rube preserved his meditative attitude, without uttering a word or making the slightest motion. At length, a low but cheerful whistle escaped his lips, and at the same time his body became erect.

'Eh? what is 't, old boy?' inquired Garey, who understood the signal, and knew that the whistle denoted some discovery.

Rube's reply was the interrogatory: 'How long's yur trail-rope, Bill?'

'It are twenty yards—good mizyure,' answered Garey.

'An yurs, young fellur?'

'About the same length—perhaps a yard or two more.'

'Good!' ejaculated the questioner, with a satisfied look. 'We'll fool them niggers yit—we will!'

'Hoora for you, old boy! you've hit on some plan, hain't you?' This was Garey's interrogatory.

'Sartintly, I hez.'

'Let's have it then, kummarade,' said Garey, seeing that Rube had relapsed into silence; 'thar ain't much time to think o' things'—

'Plenty o' time, Billee! Don't be so durned impatient, boy! Thur's gobs o' time. I'll stake my ole mar agin the young fellur's black hoss, that we'll be out o' this scrape afore sunup. Geehosopha! how thu'll cuss when they finds the trap empy. He, he, he—ho, ho, hoo!'

And the old sinner continued to laugh for some seconds, as coolly and cheerfully as if no enemy was within a thousand miles of the spot.

Garey and I were chafing with impatience, but we knew that our comrade was in one of his queer moods, and it was no use attempting to push him faster than he was disposed to go.

When his chuckling fit was ended, he assumed a more serious air, and once more appeared to busy himself with the calculation of some problem. He spoke in soliloquy.

'Twenty yurds o' Bill's,' muttered he, 'an twenty o' the young fellur's, ur forty; an myen—it ur sixteen yurds—make the hul fifty an six; ye-es, fifty-six preezactly. Then thur's the knots to kum off o' thet, though fornest 'em thur's bridles. Waghl! thur's rope aplenty, an enough over, to string up half a score o' them yellor-bellies, ef iver I gits holton 'em. An won't I? Waghl!'

During this arithmetical process, Rube, instead of gazing any longer into the barrel of his rifle, had kept his eyes wandering up and down the cliff. Before he had ceased talking, both Garey and myself had divined his plan, but we refrained from telling him so. To have anticipated the old trapper in his disclosure would have been a mortal offence.

We waited for him to make it known.

'Now, boyees!' said he at length, 'hyur's how we'll git clur. Fust an fo'must, we'll crawl up yander, soon's it gits dark enough to kiver us. Seconds, we'll toat our trail-ropes along wi' us. Thuds, we'll jine the three thegither, an ef thet ain't long enough, a kuppel o' bridles'll help out. Fo'th, we'll tie the eend o' the rope to a saplin up thur on top, an then slide down the bluff on t'other side, do ee see? Fift, oncest down on the paraira, we'll put straight for the settlements. Sixt an lastest, when we gits thur, we'll gather a wheen o' the young fellur's rangers, take a bee-line back to the mound, an gie these hyur niggers sech a lambayatin as they hain't hed since the war begun. Now?'

'Now' meant, what think you of the plan? Mentally, both Garey and I had already approved of it, and we promptly signified our approval. It really promised well. Should we succeed in carrying out the details without being detected, it was probable enough that within a few hours we might be safe in the plazza of the rancheria, and quenching our thirst at its crystal well.

The anticipated pleasure filled us with fresh energy; and we instantly set about putting everything in readiness. One watched, while the other two worked. Our lazoes were knotted together, and the four horses fastened head to head with their bridles, and secured so as to keep them behind the boulder. This done, we awaited the falling of night.

Would it be a dark night? About this we now felt anxious. It was already closing down, and gave promise of favouring us: a layer of lead-coloured clouds covered the sky, and we knew there could be no moon before midnight.

Rube, who boasted he could read weather-sign like a 'salt-sea sailor,' scrutinised the sky.

'Wal, old hoss!' interrogated Garey, 'what do ye think o't? Will it be dark, eh?'

'Black as a bar!' muttered Rube in reply; and then, as if not satisfied with the simile, he added: 'Black as the inside o' a buffler bull's belly on a burnt paraira!'

The old trapper laughed heartily at the ludicrous conceit, and Garey and I could not refrain from joining in the laugh. The guerrilleros must have heard us; they must have deemed us mad!

Rube's prognostication proved correct: the night came down dark and lowering. The leaden layer broke up into black cumulus clouds, that slowly careered across the canopy of the sky. A storm portended; and already some big drops, that shot vertically downward, could be heard plashing heavily upon our saddles. All this was to our satisfaction; but at that moment a flash of lightning illumined the whole arch of the heavens, lighting the prairie as with a thousand torches. It was none of the pale lavender-coloured light, seen in northern climes, but a brilliant blaze, that appeared to pervade all space, and almost rivalled the brightness of day.

Its sudden and unexpected appearance filled us with dismay: we recognised in it an obstacle to our designs.

'Durn the tarnal thing!' exclaimed Rube peevishly. 'It ur wuss than a moon, durn it!'

'Is it goin to be the quick-forky, or the long-blazey?' inquired Garey, with a reference to two distinct modes in which, upon these southern prairies, the electric fluid exhibits itself.

In the former, the flashes are quick and short-lived, and the intervals of darkness also of short duration. Bolts pierce the clouds in straight, lance-like shafts, or forking and zigzag, followed by thunder in loud unequal bursts, and dashes of intermittent rain.

The other is very distinct from this; there are no shafts or bolts, but a steady blaze which fills the whole firmament with a white quivering light, lasting many seconds of time, and followed by long intervals of amorphous darkness. Such lightning is rarely accompanied by thunder, and rain is not always its concomitant, though it was this sort we now witnessed, and rain-drops were falling.

'Quick-forky!' echoed Rube, in reply to his comrade's interrogatory; 'no—dod rot it! not so bad as thet. It ur the blazey. Thur's no thunder, dont'ee see? Wal! we must grope our way up atween the glimps.'

I understood why Rube preferred the 'blazey'; the long intervals of darkness between the flashes might enable us to carry out our plan.

He had scarcely finished speaking, when the lightning gleamed a second time, and the prairie was lit up like a theatre during the grand scene in a spectacle. We could see the guerrilleros standing by their horses, in cordon across the plain; we could distinguish their arms and equipments—even the buttons upon their jackets! With their faces rendered ghastly under the glare, and their bodies magnified to gigantic proportions, they presented to our eyes a wild and spectral appearance.

With the flash there was no thunder—neither the close quick clap, nor the distant rumble. There was perfect silence, which rendered the scene more awfully impressive.

'All right!' muttered Rube, as he saw that the besiegers still kept their places. 'We must jest grope our way up atween the glimps; but fust let 'em see we're still hyur.'

We protruded our faces and rifles around the rock, and in this position awaited another flash.

It came, bright as before: the enemy could not fail to have noticed us.

Our programme was already prepared: Garey was

to ascend first, and take up the rope. He only waited for the termination of another blaze. One end of the lazo was fastened round his waist, and the rope hung down behind him.

When the light gleamed again, he was ready; and the moment it went out, he glided forward to the cliff, and commenced his ascent.

O, for a long interval of darkness!

THE THEORY OF BRIGHTON.

It is a custom among everyday folk to regard a 'theory' as something vague, mystical, intangible, cloudy, evanescent, unpractical, useless—something with which a crazy philosopher amuses himself, despite the pitying contempt of all sober, sensible people. The philosophers, however, understand the word differently; they regard a theory as a method of explanation, a process of reasoning, whereby facts are to be intelligibly associated with, and elucidated by, a particular principle. Thus, there is a theory of the moon, a theory of rent, a theory of equations; and there may legitimately be a theory of roasting or boiling, of tailoring or hair-dressing—not a string of incoherent vagaries, but a consistent and persistent chain of links between facts and a principle which is to explain them. Taken in this sense, then, we ask the reader to join us in an inquiry, whether or not there can be a theory of Brighton.

Is it as a place facing the sunny south, breathed upon by warm winds when other places are bleak and chilly?—is it on account of 'the blue, the fresh, the ever free,' sparkling and dancing in the sunlight?—is it because of the magnificent esplanade or cliff-road stretching for nearly three miles parallel with the shore?—is it for the bathing-machines and the water-nymphs; or for the pebbles and Brighton diamonds; or for the downs on which the Amazons do amble and canter?—is it on account of these, or any of these, that Brighton has a theory? All of them have somewhat to do with the matter; but we wish to draw the reader into an admission that the truth lies yet a little deeper.

Our theory of Brighton, then, is, that this favourite watering-place is a *suburb of London*. It is on this principle or proposition that we build the philosophy of the whole matter.

Everybody knows that Brighton was once Brighthelmstone, a little fishing-village 'under the cliff,' or on the tract of beach under the present chain-pier. Raging winds from various quarters frequently disturbed and destroyed the rickety tenements of the fishermen; and currents driving from the west constantly accumulated heaps of shingle on the beach. Indeed, so exposed was the place, that Defoe, writing in 1724, said: 'Brighthelmstone is a poor fishing-town, old built, and on the very edge of the sea, which is very unkind to this town, and, by its continual encroachments, has so gained upon it, that in a little time more the inhabitants might reasonably expect it will eat up the whole town; about a hundred houses having been devoured within a few years past.'

It was about the middle of the same century that Dr Richard Russell began to talk and write concerning the salubrity of Brighthelmstone, and the availability of the spot to those who needed the healing agency of sea-water. Slowly and by degrees did invalids act upon this advice; but the first decided start for the little old place was when, in 1782, the 'finest gentleman in Europe' made its acquaintance. The Prince of Wales, afterwards Prince Regent, and then King George IV., from that year made Brighthelmstone his summer and autumn residence, during a long series of years. To duly accommodate the prince, a 'Marine Pavilion' was commenced in 1784, becoming the nucleus of all that fashion has done for the place in

the subsequent seventy years. The Pavilion at first consisted of a circular building, with a lofty dome resting on pillars, and a range of apartments on each side; but to complete the design, wings were added to the Steyne front in 1802; and other additions were subsequently made. When finished, it became the most singular-looking building, perhaps, in England; fantastic and irregular, and belonging to any kind of architecture that the spectator might please to name. Domes, minarets, pinnacles, turrets, and arches stand thickly clustered—a sort of hybrid among Chinese, Hindoo, Turkish, Alhambraic, and Russian architecture, which drew forth sarcastic comments from many a quarter.

When the lustre of princedom thus began to dazzle, Brighthelmstone hastened to tidy itself, to lop off excrescences, to deck itself with new ornaments—in fact, to become Brighton. Until 1793, the open space called the Steyne was a piece of common land, whereon fishermen were wont to repair their boats and dry their nets; but gentility forbade the continuance of such rude work on such a spot. It was by degrees enclosed with railings, planted with trees and shrubs, and bounded east and west by private houses of substantial character. At a later day, a statue of the presiding genius of the place, George IV., from the chisel of Chantrey, was erected on one part of the Steyne; and still more recently, another part was decked with a 'Victoria Fountain' of very ornate appearance. Brighton now became ambitious; it put forth claims to be a watering-place and port available for steam-vessels. There was no convenient landing-place; and it was thought that if a pier were carried out into deep water, steamers, as well as smaller craft, might be accommodated. They were days in which suspension-bridges were regarded as wonders of mechanical construction; consequently, Captain Brown's 'chain-pier at Brighton,' finished in 1823 at a cost of L.30,000, was long a subject of pride and admiration to the townsmen, and, it may be added, still longer a source of loss to the shareholders; for it suffered in many gales, and has not sufficed to attract steamers to an exposed and very shoal beach. In more recent times, it has been little other than a lounge and promenade for visitors.

Passing over all those matters which can be learned from any guide-book, and which need not occupy space or attention here, we come at once to this point—that the theory of Brighton does not rest on royal favour. George the Magnificent passed away; and during William's reign, the Pavilion was in a doubtful state, scarcely certain of its own position. When Victoria became queen, and hastened from one to another of her palaces to see which she liked best, she quickly decided against Brighton; a water-side palace, shut out from the sea by intervening houses, and with no windows to look out upon anything worth looking at; a town in which she could not walk to the cliff or the beach without being surrounded by a gaping crowd—these things did not please a young girl who had ever been fond of scenes of natural beauty. The maiden-queen of 1837 refused to make the pavilion one of her residences; and the matron-queen of 1856 keeps equally aloof from the place. There is not a pleasure-town in the kingdom from which the sovereign more completely holds aback; and so evidently was this abandonment a settled thing, that the crown has sold the Pavilion to the corporation for L.53,000, to be used henceforth for holding concerts, assemblies, fêtes, &c.

No, the sunshine of royalty does not afford the explanation; we must go back to our suburban theory. In the stage-coach days, when the Pavilion had not yet lost all chance of remaining a royal palace, Brighton was a pleasure-town for the high-born and wealthy. The distance from London, covered by a briak six hours' drive, was the shortest to any point

on the sea-side, and was enlivened by a breezy passage over the downs. Brighton was, however, an expensive place for the middle-classes, who rather took the packets down the river to Gravesend and Margate. Meanwhile, the townsmen, mindful of the requirements of aristocratic folk, did their best to supply Brighton with all the needful accommodation. They built a sea-wall along the east cliff, 60 feet high by 18 feet thick at the base, to resist the ravages of the sea, and form a basis for one of the finest carriage-drives in the kingdom; and profitably was the sum of £100,000 thus laid out. They built a Marine Parade, or succession of fine terraces, eastward of the Steyne; and still beyond this a group of magnificent houses called Kemp Town. They stretched the sea-front in like manner westward, until it met the once distant village of Hove; and then overpassed it with the now growing Cliftonville. And this long sea-line of nearly three miles is marked by such an array of squares, crescents, and terraces, as no other sea-side town in the British dominions can equal. They—that is, the townsmen—did all that townsmen could do to provide the lazy luxuries for sea-side pleasure-seekers—baths, bathing-machines, club-houses, news-rooms, bazaars, music-rooms, a theatre, an assembly-room, a race-course, regattas, and so forth. Under the influence of these various attractions, Brighton grew amazingly. In 1801, its population was only 7337; these numbers augmented to 12,012 in 1811, to 24,429 in 1821, and to 40,634 in 1831.

Then came the railway-days, which frightened the builders of the splendid mansions and terraces. A fear was entertained that the cheapening and facilitating of access to Brighton would drive away the noble lords and right honourables, by attracting those of humbler rank and smaller means. If Brighton had been a hundred miles distant from the metropolis instead of fifty, it would be hard to say what effect the railway might have wrought; but it is just because fifty miles is a suburban distance, measured by railway standard, that Brighton has assumed a character to which, perhaps, there is no parallel in Europe, in a town of 50,000 or 60,000 inhabitants.

Let us see how this is. During the busy season, there are twelve or fourteen trains per day from London to Brighton, and about an equal number in opposite directions. The road being direct, and the locomotive service good, the time of transit has been gradually lessened, until it averages little more than an hour and a half. Any Londoner can go and enjoy a day's pleasure, or transact a day's business, at Brighton, and return to the metropolis on the same day. Any Brighton resident can make London the scene of his daily business, and return to Brighton in the evening. The lady of fashion and fortune, without employing her own horses and carriages on a turnpike road, could leave London after a drawing-room at the palace, and reach Brighton to dinner, if so disposed. Her noble spouse might, at a pinch, leave Brighton after dinner, by the nine o'clock evening express, and be in time to vote in the House at eleven; or, reversing the order of things, he might make a three hours' speech in the House early in the evening, and yet be in Brighton to supper. A banker in Lombard Street, or a dealer in tapes and silks in Cheapside, might breakfast in Brighton, start by rail at a quarter to nine, and reach London Bridge station by ten, ready for business. Now, let us remember this—that many of the omnibuses at the outskirts of the metropolis take an equal space of time to reach the Bank. Let the denizens of Kilburn, of Notting-hill, of Kensington, say whether they reach their city premises in quicker time than this Brighton morning express would enable its passengers to do. Active men measure their movements by time rather than by space; they care nothing about the miles; they only look to the

cabalistic Bradshaw symbols, 8-45—10-0; they jump in, and leave the locomotive to do the rest.

But it may be said—though the rail thus virtually extinguishes four-fifths of the space, it does nevertheless involve the expenditure of a larger sum of money. This is true, yet not so true as to disturb the man of easy means. The company has been shrewd enough, too, to see the value of a liberal policy. There are season-tickets, and tickets available for two or three days, and daily tickets, and excursion tickets on two days in the week—there are many ways of angling for the fish successfully, because the fish are very willing to be caught. There is a whole body of philosophy in the advertisement so familiar to all eyes: 'Eight hours at the sea-side.' It goes to the root of the matter at once. A town *must* be in the suburbs if we can go thither after breakfast, spend eight hours, and then return betimes in the evening. It brings the sea-water and the sea-breeze almost to our doors; and the whole social machinery of the day is as easily managed as if the distance were five miles instead of fifty.

Let not this be regarded as a baseless estimate—a mere attempt to say something smart at the expense of verity. Changes which go on gradually around us are scarcely measured at their proper value, until we steadily pass our thoughts over an intervening period, and compare (say) 1856 with 1836, or any other definite date. Doing this in reference to the subject of locomotion to and from the metropolis; and bearing correctly in mind the kinds, and cost, and times of travelling before the railway era—it will, we think, be admitted that places forty or fifty miles distant from the metropolis, are, both for social and for commercial purposes, virtually as near as the suburban villages were before that era commenced.

And this is what we mean by designating Brighton a suburb of the metropolis. That town is the nearest point at which the sea can be reached; it has many of the elements of a pleasure-town, of a health-seeking town; and yet you can travel from that town to London more quickly than you can traverse the 'huge wen' from one extremity to another. Nor do we, in saying this, wish to shew homage to that particular town alone. Brighton must, from its geographical position, continue to be the nearest sea-side place to London; but the principle we are endeavouring to elucidate is supported by a multitude of other places—wherever, in fact, cheap railway rides bring a pleasant spot within an hour or two's distance from the metropolis. At Southend and Gravesend, at Erith and Greenhithe, at Lewisham and Sydenham, at Mitcham and Epsom, at Wimbledon, Richmond, Kew, Windsor, Sunning-hill, Boxhill, Chertsey, Hampton, Harrow, Hornsey, Waltham, Epping—at places so numerous that this column would scarcely contain their names—the principle in question is working out its results day by day, and every day yet more and more. *Ten millions* passengers depart from and arrive at the London Bridge Railway terminus alone, annually—being those who are carried on the various lines belonging to the South-Eastern and the South Coast Companies. If to these be added the millions presented by the terminal at Fenchurch Street, Shoreditch, King's Cross, Euston Square, Paddington, and Waterloo Road, some idea may be formed of the daily outgoings and incomings of this vast mass of human beings. Nor would it be just to omit mention of the river-steamers as contributing towards the same general result. Let those who are concerned in the matter determine whether there be commercial wisdom in carrying passengers from London to Margate for 1s. 6d.; all we have to do here, in connection with the present argument, is to know that such has been the case during the past summer, and that 2000 Londoners have on some days made this voyage. And what is yet more wonderful, perhaps, is the maintenance of a fall

number of steamers to the very places where the railway accommodation is so complete. During the past summer, there have been nearly twenty steamers between London and Greenwich, making perhaps sixty voyages daily in each direction; and yet the railway trains have also been nearly sixty in number each way. Different companies ran trains to Woolwich, on two railways, one nearly thirty times, and the other nearly sixty times per day, in each direction; in addition to a number of steam-voyages nearly equal to those to Greenwich. Gravesend was supplied with twelve trains per day by one company, and eleven by another, besides several steamers. Up the river, too, the steam-traffic has augmented the accommodation to places served by railways, as well as other places not so served, by the several piers at Vauxhall, Nine Elms, Fimlico, Chelsea, Battersea, Wandsworth, Putney, Hammersmith, Kew, &c.

Theory or no theory, this suburban question is of the highest importance to the wellbeing of the metropolis. Boards of Works and Boards of Health may do what they can, and may do much more than has yet been done; but all their labours would fail to preserve or increase the healthiness of London, if the railways had not furnished to the moving mass facilities for getting away to the green fields and the blue sea. Whether for a day or for a season, it is good to do this; thus the benefit applies, in the end, to all classes but the extreme poor—and they must be poor indeed who, in these cheap days, cannot afford an occasional inhaling of fresh air in the belt of country, fifty miles radius, which now constitutes the suburbs of this huge metropolis.

Perhaps the reader will now admit that there may be such a thing as a theory of Brighton—and that the theory is, that Brighton is one of the suburbs of London.

THREE CHAPTERS OUT OF MY LIFE.

CHAPTER II.

Just at the time when I was about to go to Russia, there came from thence a Mr M—, who had been appointed governor of Yakutsk. When he heard that I was well acquainted with the language and manners of the Yakuts, he sought me out, and made my acquaintance. Although I had very little desire to return, I went back with him to Yakutsk, and this simply because I had the welfare of the Yakuts at heart, and also because I could not fail to remark the strength and vigour of intellect of this new official: at the same time, I had a foreboding that my return would bring forth nothing but trouble and misfortune. The result will shew how correct was this apprehension.

To the south-east of Yakutsk, and at a distance from it of more than 100 kōs, is a tract of land called Udskoi, celebrated as a hunting district. The circumference of Udskoi is about 500 kōs; it is bounded on the east by the Sea of Okhotsk; on the south, by China; and on the north and west, by Nertschinsk, Oekmink, and Changangy. The province of Yakutsk is so inordinately large, that this district is looked upon as a remote and desert land; through the whole extent of it there are not more than four or five hundred nomadic Tungouses; yet these, on account of their riches and peculiar condition of life, should not be passed over in silence.

At the time of which I speak, a great number of Yakuts and Russians were in the habit of journeying hither, in order to buy furs from the Tungouses, which they could do at a very moderate rate; and they left their own goods in exchange, for which they charged monstrous prices. This gave rise to so much fraud and oppression, that the inhabitants of Udskoi were almost ruined; and other difficulties added to this,

rendered it necessary to send an overseer to Udskoi. I was chosen to fill this situation.

For two months before my departure, I had a great number of documents to write; and this work, together with the preparation for my journey, was only the commencement of the endless trouble that awaited me for the space of a year and a half on my distant travels.

My outfit consisted of three changes of winter-clothing, four changes of summer-clothing, tea, sugar, dried Russian biscuits, ment-pies, guns, gunpowder, and lead, a little rum and spirits, and also meat, and Yakut and Russian butter. All these were packed in leathern bags, each containing two and a half puds (a pud weighs forty-six pounds), or else in wooden chests: after they had been safely covered, so that no water could penetrate the packages, they were bound round with leathern thongs, and divided into so many horse-loads, each load consisting of not more than six puds.

Although it was the month of February, the severity of winter had not begun to diminish. According to an instrument (Reaumur's thermometer) with which the Russians measure the degree of cold, it was below thirty when I left the town of Yakutsk, with the two Cossacks who accompanied me. We travelled as far as Amga—a distance of thirty kōs—in sledges drawn by horses. At Amga we packed our luggage on the backs of seven horses, mounted three ourselves, and, accompanied by two guides, proceeded on our journey. The horses were all fat, and consequently full of spirit, so that they would not proceed quietly with their burdens. For this reason, and because we did not wish to overheat them on the first day, we halted at a place not distant more than three kōs (thirty versts) from Amga, where we determined to pass the night.

The guides, first of all, unloaded the horses; they then shovelled away the snow, till they came to the hard ground, when they began searching for dry wood. So soon as this was found, and a fire kindled, they filled the tea-kettle and another larger kettle with snow, in order to get water for cooking; and after we had been thoroughly warmed by the tea, they set to work to prepare a place for the night. To begin, they made a heap of small twigs and branches; over this the saddle-cloths were spread, and on the top of all came a bed of bear-skins. After consuming the supper which was prepared for us, we clothed ourselves warmly for the night, and went to bed; the boots, stockings, and gloves which we had taken off, being completely wet, were buried in deep snow, to draw out the moisture. At break of day we rose, and took our clothes out of the snow, where they had been better dried than they would have been in the house, and hastily dressing ourselves, proceeded to wash with snow, shivering all the time. We made tea with snow-water, and then went on our way. In this manner we continued our journey until the snow had melted.

Here I must remark that one of the greatest hardships of a winter-journey is the undressing one's self and going to bed in the freezing cold; and yet the getting up in the morning, throwing off the thick warm covering, and washing with snow, is fiftyfold more intolerable, and that man must have a frame of iron who can endure it without injury to his health.

I never drink strong exciting liquors, and consequently know nothing of their value to other men, but I believe it would be impossible to maintain life on such journeys if it were not for tea. I am not now taking the Yakuts and Tungouses into consideration, for with these people, who are born and bred on the snow, it is a customary thing to travel for two or three days without any food at all.

After journeying four days, we reached the shore of the great river Aldan, opposite that part where to the right the Utchur flows into it. Here we halted

at the hut of a Tungouse, who told us that, from the entrance of the Utchur to the place whither we had to travel—an expanse of ten *kös*—the snow had fallen to a depth of seven spans,* and that it would be impossible to make our way through it. This intelligence caused us great embarrassment, for we had no instructions to alter our course, and that was the only way of avoiding the snow. Had we done so, we should also have been obliged to go round a distance of twenty *kös*, and for want of fodder, must have given up our horses, and taken reindeer. The loads, too, must have been made smaller for the reindeer, but it was impossible to divide them, as we had no more packing-cases or bags to put them into. Consequently, we resolved to proceed along the river Utchur; and during the two days which we remained in the Yurte, we busied ourselves making snow-shoes. The two horses which were not loaded, we tied up for two whole days without fodder, and on the third we crossed over the Aldan. No sooner had we set foot upon the ice of the Utchur, than the depth of snow began to impede the pace of our horses.

A guide on snow-shoes went first, leading the two unloaded horses; these plunged forwards so that their entire weight was thrown on the hind-legs, and thus they broke through the hard crust that covered the snow. Our horses were tied together, and followed in single file, keeping in the beaten track of those that preceded them.

We travelled in this manner from early morning until night, but with the greatest exertion could not accomplish more than one *kö*. We were therefore ten days travelling over the ten *kös*, where the snow lay so deep. During this time, we scarcely ever mounted our horses, for, in consequence of the difficulty they had in keeping their feet or getting on through the snow, it was almost impossible to sit firm in the saddle. Walking, however, produced an insupportable weariness, and for this reason, we, for the most part, laid aside our snow-shoes, and went on foot.

Both banks of the river Utchur consist of perpendicular rocks. At the foot of these rocks there are here and there small ledges above steep, black, crumbling precipices. It is impossible for a heavily laden horse to mount these precipices; so, when we had decided on halting at any place for the night, we used to throw the packages on the snow which covered the ice of the Utchur, and lead one horse after another up the precipice. We then turned them loose to scrape their fodder from under the snow. Sometimes they could not scrape away the deep snow of the forest, and then they ate the twigs and young branches of the willow and birch.

We had scarcely overcome the difficulty which the snow had presented, when a new hindrance appeared. The severity of the cold had forced water out of the rocky banks of the Utchur; it flowed into the river under the ice, which was heaved up by it until it cracked and burst—although twelve or thirteen spans thick—and the water streamed over the surface; so that our horses had to wade up to their knees in water. In some places, this water had frozen over the first ice, and made our way as slippery as glass. It was impossible for unshod horses or reindeer to keep their feet on it; so two of the guides went forward, and made notches in it with their knives and hatchets, and we followed after them on foot. In other places, when we were near the black crumbling precipices, we carried away the dry earth or sand in baskets, and scattered it over the surface of the ice. Nevertheless, every now and then it so happened that there were spaces where no sand was strewn, and no notches had been made; here our sixteen or seventeen horses would slip and fall, the girths break, and the packsaddles and all the

baggage be thrown on the ice. The greater part of the day was often taken up in repairing these accidents.

In the course of our journey, we came to some very wonderful mountains. The severity of the winter's cold had forced water from the summits, which was now flowing down the whole side of the mountains and over the glittering ice which covered them. At sunset, when the rays of the cloudless spring sun fell upon these rocks, they seemed like a many-coloured rainbow, or as if set with flaming jewels. At the foot, there was always standing water, which did not freeze.

There is a river of the name of Agna which falls into the Utchur on its left side. Travellers turn to the right, and journey along this river.

It was in the month of April that we reached the Agna; and as we went our way along, we suddenly saw in the distance a black moving form on the bank. At first we took it to be an animal; but, drawing nearer, saw that it was a Tungouse, who sat there weeping. After he had stood up and greeted us in his own fashion, he told us his pitiful tale, as follows:

'When I went into the forest yesterday, I found in many parts of it traces of a herd of wild reindeer; so I went back to my family rejoicing greatly at my good-fortune. I cleaned my gun, and put it in good order. Afterwards, I rested a little, and towards midnight, just when the half-melted surface of the snow is again frozen over, I put on my snow-shoes, and led my dog to the place where I had seen the tracks of the reindeer. I waited here two hours for the dawn to break, and smoked my pipe; then, as soon as the footprints of the reindeer were visible in the morning twilight, I let my dog loose, and followed him, running in my snow-shoes. In this manner I kept up with him for more than a *kö*, leaping from rock to rock, and springing over stream after stream. At length blood from the feet of the reindeer began to be visible on the fresh frozen snow: and from their faltering pace, it was evident that they were tired out; then I heard the continuous barking of my dog, and knew that I should come up to them in time. But suddenly the bark of my dog was changed to a howl of agony. I started, and my heart beat as though it would have burst. I redoubled my speed, and saw before me, at the distance of two gunshots, two small black scraps lying on the snow covered with blood. Just at the moment that my dog had come up with a large herd of reindeer, and had driven them into a small brook, where he was keeping them until I came up, by barking and running round and round them—two hungry wolves leaped down the steep side of a rock, and seizing him, one by the head, the other by the body, with one grip tore him in two. The reindeer had escaped, and were all scattered hither and thither.

'My poor dog was seven years old. He first went hunting with me as a puppy of six months old; and for six years he has never let me know a hungry day. I have been offered five reindeer for him, but would not have parted with him for ten. Yesterday I was rich; now, I am the poorest of men. I know not how I dare shew myself to my family; wife and children expect the dog, to stroke and kiss him, and their tears will make my heart bleed anew.'

I could not help the poor man; so after I had tried to console him with a few kind words—that what is past will not return, and that which is empty cannot be filled again, and that hope in God is surer than anything else—I went on my way.

We travelled forward, leaving the Agna behind us. In our way there stood a high mountain, difficult of ascent, which we had to pass over; and on the other side of it lay the Utchur. When we were within two *kös* of the mountain, we met many travellers journeying together; and they told us that the snow lay upon it thirteen spans deep, so that it was quite impassable. However, when we had reached it, our people got

* The span of the thumb and middle-finger.

together about ten horses and ten reindeer from these ravers, and then unloading, proceeded to lead them up the steep side of the mountain, thus breaking through the crust of snow. They themselves were furnished with snow-shoes.

On the following morning, we all, with great difficulty, passed over the mountain.

On the 1st of May, we arrived at the yearly market of Udsokoi. At this place of general resort, I collected the yasak, and fulfilled other imperial commissions; then, after resting the horses, which were completely worn out, on the 1st of June we started for Udsokoi, taking with us the ten reindeer which we had bought.

The distance from the place of meeting on the Uchur to Udsokoi is about fifty kōs, but on account of the difficulty of the road, it is reckoned at seventy. The traveller passes from one stream to another, from one river to the next, and climbs mountain after mountain. As it was the rainy season, we had to make the horses and reindeer swim across the rivers; many of them were crossed by the help of a flat-bottomed boat which we built. The ground we passed over was covered with sharp-pointed stones, or else consisted ofathomless mud-holes, never dry.

If once a horse fall into the mud, it can scarcely get out again alone. Our seventeen horses, with their packs, fell in one and all. The guides, wading up to their waists in mud, dragged off the baggage, and piled it up in a dry place; then they made right anything that was broken by the plunging of the horses in the mud; and when these had got out, they were loaded anew. Perhaps they had scarcely gone on for twenty yards, when they would fall in a second time, and the guides had all their trouble over again.

Once, as I was standing up to the waist in mud, holding up the heads of three horses which had fallen in, lest they should sink and be suffocated, a fourth, which could not keep its footing, fell in near me. His head was under two or three times only, but he was dead before any one perceived it. These difficulties were increased by the frightful heat of the sun, and by such myriads of flies, that we could not breathe for them. They swarmed about us especially during meal-time; and no sooner was anything poured into a cup, than they fell in and filled it, even in the moment that you were lifting it to your mouth.

I must give the Yakut guides the well-merited praise of encountering all difficulties without shewing the least ill-temper or dissatisfaction; and yet they do their work for a small sum of money, which does not half repay them for their trouble. And here, in passing, I must make a few remarks on the qualities of these guides. After one of them has completely exhausted his strength during the day by struggling with all kinds of difficulties—mud, water, the heat of the sun, mosquitoes, wasps, and gadflies—he sets to work at midnight to mend his own clothes, and any of the harness that may be broken. By the time this is completed, the horses are cool; he then ties their legs together, and turns them loose to graze; but every half-hour he goes out to see that they are not caught in the bushes, or devoured by any wild beast, so that he never has more than two hours' sleep out of the whole twenty-four.

After we had travelled about ten kōs beyond the Uchur, we came to a mountain of the name of Dschugdschur, or the great mountain, which we had been long expecting to reach. It is called the girdle or backbone of the country, because it runs through the whole length of Siberia, reaching over an extent of many thousand kōs without a single break, until it reaches the ice of the Arctic Ocean, where it slopes down to the level of the sea, and terminates.

We reached the foot of this mountain-chain just after mid-day, so we halted for the remainder of the day and through the night, that our horses might have

time to rest. On the following morning, before sunrise, the horses were saddled in a new fashion, one of the girths being fastened across the breast, and the other round the body, close to the forelegs. In the meantime, we prepared to ascend the mountain on foot. The horses followed, one after another, treading warily and cautiously, so that not one of them was caught in a thicket, or slipped into a crevice of the rock, or a hollow filled with water. If they had made a single false step, they would have fallen down a frightful abyss, and been crushed so that no bone would have been left unbroken.

After thirteen or fourteen hours spent in the ascent, we found that we had reached the summit of the mountain. Here it was quite cool, and there were no flies and wasps to torment us. We halted two hours, by which time we were nearly frozen with cold. Seen from this point, all the mountains which had previously appeared of a very respectable height, looked like low insignificant hills; and the many broad rivers which have their source in these Dschugdschur mountains, were flowing down the sides in narrow glittering silver threads.

On a wet day, when the rain-clouds hover in the air like fog, they are torn asunder by the summits of the Dschugdschur, and the separate masses float about like porridge of meal and bark. Any one standing on the peak which breaks the clouds, may see how a dew-drop or rain-drop falls on the sharp edge of a stone that lies beneath it; how it is divided into parts, and trickles a scarcely visible droplet down either side. Hence the thought arises, how the drops that trickle down to the east are followed and overtaken by others, until they flow on in a hairbreadth line, and so grow into a murmuring brook, gradually increasing and mingling with other brooklets—the murmuring brook becomes a rushing stream, and at length a mighty river, which loses itself in the boundless, never-frozen Pacific Ocean. Here it is tossed about through countless ages, mixing with the waters of every known sea.

The remainder of the drops of which I speak, take a different direction, and in like manner flow westward to increase the stream of that great river the Lena. Journeying along the course of it, you come to the Arctic Ocean. Here it becomes ice, and forms a barrier which no human thought and no human power can overcome.

A R A R A A V I S.

In the city of Damascus—that ancient city whence came Eleazer, the faithful servant of Abraham—that city of narrow streets and riderless donkeys—that eastern paradise, where hours glide about like ghouls under cover of their hideous veils, and keep all their sweetness and beauty for the especial behoof of Blue Beards—that grand resort of straw-hatted travellers with fabulous wealth in gold—even there, O reader, once upon a time, there dwelt a Turk! That, I grant, was nothing uncommon; but then this Turk possessed a slave, which is also no uncommon circumstance, and this slave was outwardly black—so black, that his shadow always left a dark mark upon the wall (at least so tradition says); and what is more remarkable still, he hated falsehood, and loved the truth. Now this, you must admit, if you have any knowledge of an African, was a most astonishing phenomenon; so much so, that, in comparison with it, all the recent discoveries of science sink into insignificance. It is far easier to conceive that the old theory about the composition of the moon, with regard to cheese of a particular colour may be true, than to conjure up a nigger whose only weak point was a stringent adhesion to truth.

Sometimes we hear of what philosophers, or naturalists, or botanists term a *lusus naturæ*—an

extraordinary freak in nature, by which a fig-tree produces pomegranates, or an onion-plant yields a potato. Just such another phenomenon was this Selim, the black slave, who had as great an aversion to anything bordering on an untruth, as a timid old lady might have to a rattlesnake. And this, strange as it may seem, was the head and front of his offending, the block in his uneven path through life, over which he was continually stumbling and grievously bruising his shins.

His proprietor—who might have been a descendant of Baron Munchausen, judging from his peculiar failing in the baron's line—often but vainly lamented Selim's veracity. In every other respect, he was the model of what a slave ought to be: docile, obedient, attentive to the smallest wants of his master; none could equal him in replenishing a pipe, fetching a piece of fire, or making a brew of Turkish coffee. But, as is the custom in Damascus, Selim invariably accompanied the Turk on all out-of-door excursions, whether to the gardens to make kief, or to a friend's house to smoke the pipe of repose. As is also the practice, servants and slaves always on these occasions remained in the room, mingling ever and anon, with all due respect, in the current topic of conversation. Hence it arose that, whenever the old Turk indulged in flights of imagination, he was suddenly and unceremoniously checked, and ignominiously exposed, by his slave deliberately giving him the lie.

In vain had the master remonstrated with him; in vain had he punched his head and cuffed his ears; in vain, finding all simple remedies fail, had he resorted to the application of the corbush and bastinado, and even threatened the torture of a red-hot iron skull-cap. Selim, under suffering, always promised submission; but no sooner had the pains and scars of the last chastisement subsided, than he relapsed into a tenfold state of veracity; and the old Turk, outraged beyond measure at being continually thwarted in his hobby, finally came to the determination of selling this incorrigible black, and thus easing his conscience of a most unpleasant mentor.

Accordingly, the public auctioneer of the town was summoned, and the Turk taking him aside, entered into full details as to the character and capabilities of the slave; candidly revealing the real cause of his dissatisfaction with him, and urging the necessity of his being disposed of at any price offered by the first bidder.

Selim was accordingly transferred to the slave-market; but, for some reason or other—very possibly a knowledge of his failing had got wind—purchasers, though they paused to look at him, passed on, and made no offer.

At last, one pleasant-looking old Turkish effendi, struck by the intelligence of Selim's face, and the goodly proportion of his limbs, paused and inquired the price. The auctioneer fixed upon a sum so absurdly beneath the current value of like saleable goods, that the old effendi was startled, and begged to be informed as to the failing of the slave. The auctioneer acknowledged that he had one great failing, but that he was not at liberty to state what that was until after the bargain was closed.

'Does he steal?' asked the effendi.

'No; as honest as an ulema.'

'Does he drink then?'

'No; as sober as a dervish.'

'Is he indolent and lazy?'

'On the contrary, as active and as nimble as a flea.'

'Not steal; not drink, and not lazy. Why,' muttered the effendi, 'there cannot be much wrong with the slave who is free from these failings.'

Accordingly, the bargain was soon concluded; and when the auctioneer told him the real state of affairs,

the old effendi congratulated himself mightily, and chuckled over the prize.

'Ihmedel' Allah!' quoth he, 'lying is a thing I detest; and most assuredly this slave will never have occasion to correct.'

Selim being conducted home to the house of his new master, and there duly installed, was summoned into the effendi's presence.

'Selim,' said he, 'I am aware, as you know, of the cause of your late master's dissatisfaction, but as I abhor all deviation from the truth myself, I have but little to fear from your propensity. I wish you to understand, however, that, on the other hand, I never brook any impertinent contradiction from my slaves—not even when I am alone, much less in the presence of strangers. Now, bear this in mind, for disobedience will be visited by punishment, to which all you have hitherto suffered will be mere flea-bites.'

The unhappy negro, who entertained a very keen recollection of the last hundred and fifty stripes, winced terribly at the information; when, to encourage him, his master proceeded:

'If, on the other hand, I find you act up to my wishes, I promise you a complete new suit of the finest cloth, with red cap and slippers to match—such, mashalla! as no other slave in Damascus ever sported.'

This was touching upon a very tender chord with Selim; if he had one great weakness, it was the love of dress. He was, like most of his ugly countrymen, who the more intensely black and distorted they are, are the more puffed up with inconceivable vanity; so he mentally determined to make one strenuous effort to overcome his awful propensity.

For some time, things went on smoothly enough, though the slave very soon discovered, much to his regret, that his new master, notwithstanding all his assertions to the contrary, was a tolerably good hand at drawing the long-bow. Nevertheless, the inducement to silence was a great one, and Selim managed to bottle up his effervescing truth for a considerable interval. The clothes were almost within his grasp.

One day the effendi was invited out to a dinner at some great Turk's, and, having duly warned the slave, went at the hour appointed. It was a very great affair indeed, for the windows were all closed, and the Koran hidden under a divan-cushion—just for conscience's sake, I suppose. Then these sons of Islam made great havoc with half-a-dozen bottles of the strongest spirits, which they, after a manner, diluted by eating an unconscionable amount of raw cucumbers and salt. After that, a sumptuous dinner was served, and partaken of. Then came pipes and coffee; and under all these combined influences, the usually silent tongues of the assembled effendis relaxed into garrulous conversation.

The topics were various, but diverged gradually into the one channel of self. Whether it was the spirits, or the cucumbers, or the good dinner that did it, I am unable to say; possibly, under their combined influence, the usual precaution of the slave's master was forgotten, and he felt himself puffed up with pride, and labouring under the notion that he possessed fabulous wealth—which was a sad hallucination.

After various startling assertions on the part of others, Selim's master, who had lately erected a low shed, proclaimed very pompously that he had lately built a house which was at least forty yards long!

Hereupon Selim, who was standing exactly in front of him, and who could not possibly swallow this enormity without bursting, began twitching his hands and undoing the buttons of his tight jacket after a most alarming fashion, which not only attracted the notice of strangers, but very much terrified his master.

After a brief and awkward pause, one of the party returning to the charge, begged to be informed of the breadth of this new building.

'Two feet!' replied the conscience-stricken effendi.

much to the astonishment of his listeners. This assertion pacified any qualms that Selim entertained; but he most inquired innocently what such a building might serve for.

'Why, you see,' said the effendi, 'I had fully intended building a house as broad as it was long, but that counsel of a slave there thwarted me in my purpose, and instead of a *Château en Espagne*, I have been obliged to content myself with a brick-wall.'

This restored immediate good-humour to the party; and Selim astonished himself and the natives by appearing next week in his promised suit of finery.

A WALK IN WATLING STREET.

WHILE in Shropshire during the past autumn, I resolved to put in force an old intention, and visit *Uroxeter*—the *Uriconium* of the Romans. I had first repaired to the museum in Shrewsbury, to see if any relics were preserved there of this once considerable city. I found some few, but, what was of more account, a most intelligent friend in one of the curators—I chatted the matter over, and agreed to visit the old Roman site together. We fixed the morrow—a day in the end of September—and for starting, the hour of noon.

It should have been an earlier one, considering the lengthened walk which lay before us, and what we had to see; but from the meagre accounts I had read, and from what little had been told me, I fancied our antiquarian labours would be summed up when we had looked at the celebrated fragment of the old Roman wall, and sought for a few coins in the cottages of the surrounding peasantry. I was thus wholly unprepared for the extent, variety, and massiveness of the remains; the fragments of pottery, broken shafts, pediments, and bases of columns, colossal heads sculptured out of the coarse red sandstone of the district, portions of friezes, and much other fragmentary evidence of a considerable city, a civilised people, and extensive public buildings that were adorned, if not in the highest style of art, at least with some skill, and with the well-known taste of the conquerors of the world.

It was two o'clock before we could manage to start. Then with light hearts, and much enthusiasm as to the purpose in view, we set out from the good old town of Shrewsbury; over the Severn, past the old abbey, and so away till nothing but the country lay around us, bathed in the splendid glory of the autumn afternoon. At the distance of about two miles from the town, we came again in sight of the Severn, now rolling far below the steep road-bank; the other shore more level, and stretching away in picturesque undulating meadow-land, to the fine woods about Haughmond Abbey. On this bank we rested for a time, the heat being extreme; and a more lovely spot for a 'traveller's rest' we could not have chosen, had we searched England through; for the noble river, as though conscious of its own magnificence, swept majestically onwards in curves and windings of great width, sometimes dark from excessive depth, sometimes clear as a mirror, where it rolled over gravelly shallows, or purled round tiny islands, brimmed by the droughts of summer. By and by, we went onwards; again crossed the Severn at Atcham Bridge, where there is another exquisite river-scene, and an old country churchyard dipping thereto, of exceeding picturesqueness and stillness. About a mile beyond, we stayed at one of the lodges of Attingham Park to inquire our way. The woman who answered us pointed to a silvan-looking lane opposite, down which we turned, and were soon in the pleasant shadows of the overarching trees. Some distance down this, we turned at right angles into a lane still narrower, and began to ascend. In a moment or two I stopped, and pointed to the ground. 'We are quite right,' I said; 'this is the Roman road;' and most certainly here was

the adamant floor of concrete and small pebbles which, some sixteen hundred years ago, the many-nationed legionaries had made and trod. It was a fragment of one of the great military ways which crossed Britain from Dover to Chester, and named afterwards, by the Saxons, Watling Street. As we passed on, we could see how it was raised above the adjacent land—as the Roman roads always were—and looking just as I had seen the same great highway twenty times before, stealing its way amidst the solitary hills of northern Shropshire and parts of Radnorshire.

We stayed by a low stile, perfectly garlanded by a wealth of woodbine flowers, to take another look at the splendid river, which here flowing to our right, and almost as wide as the Thames at London Bridge, was decked with wooded as well as lawn-like islands of considerable size. To this the meadows near us dipped by a steep descent, and, altogether, my eyes had never looked upon so splendid a scene; for, as in all mountain views, great depth and shallowness lay in contiguity, thus giving effects of light and shade, of stillness and motion, which, in the full richness of an autumn afternoon, a great artist could alone appreciate.

We had already resolved to call upon Mr Stanier, a wealthy gentleman of the district, who possesses some few of the relics preserved from *Uriconium*, and who exhibited a very good though small collection of Roman lamps and pottery at the meeting of the Archaeological Institute in Shrewsbury in 1855. We therefore proceeded to find out his residence, but, presuming it to be more within the village than it was, we passed onwards towards the picturesque church, the spire of which we could see in the distance. Turning my head, as we went by a gate leading into a large level field from which the corn had been newly carried, and on whose opposite side stood a recently erected and somewhat unsightly red brick farmhouse, with extensive out-buildings, something most singular instantly attracted my gaze. In the peculiar light of the waning sun, and as we stood—which was, as it were, sideways to it—this something had all the effect of a vast screen raised against the sky. 'That must be the Roman wall,' said I; 'nothing but that could stand out in such marvellous relief!' My companion dissented; but still retaining my opinion, we proceeded, and soon learned that we must retrace our steps, as we had already passed Mr Stanier's residence. As we did this, again the gigantic mass loomed in sight, with an effect upon me the strangest in the world. I could no longer think I stood on the highway of a solitary English hamlet, with the drowsy hush of the autumn afternoon round me; but in city streets, in the precincts of temples, basilicæ, and amphitheatre, and with the mingled tongues of conquerors and conquered sounding in my ears!

Mr Stanier was out shooting, but might be home by and by; Mrs Stanier was an invalid, but she very politely sent a servant with us; and we were soon across the great stubble-field, and in the yard of the new-built farm. My conjecture had been correct; it was the wall I had seen; and here our attendant left us. Another lane to cross, another gate to open, and there, in the midst of an immense field, just cleared from its recent corn, stood the vast mass of imperishable masonry. The field slightly ascends, though not in a degree to be called an acclivity; and up this we toiled, very warm, and very glad to reach such shadow as the wall cast, though that was but slight as the sun then stood.

We sat down upon the stubble and contemplated what was before us. We were not solitary, for though reapers and gleaners were all gone, a man and boy were at work about it, digging a foundation for a slight iron fence, to be put round for its better protection. This had been subscribed for at the meeting of the

Archæological Institute in the preceding year, and stands forth as a creditable exception to the utter disregard generally shewn to our national monuments. This circumstance, simple as it was, was so far fortunate, as it enabled me to judge for myself of the extraordinary character of the soil, as the man had cleared out several holes to a considerable depth. From the top to the bottom of these, indeed wherever he might dig, was the same intensely black mould, pulverised to an extreme degree of fineness, and as free from all extraneous matter, except some few bones, and scattered fragments of the wall, as though passed through a miller's bolting-cloth. I observed the same thing afterwards at some distance from the wall, and in an adjacent lane, and the labourer told me that the same peculiarity extended as far as the surrounding fields.

'You get unusual crops,' said I, 'and in spring can distinguish them by their more intense greenness?'

'Yes, that's all true,' was the answer. 'It's a wonderful piece of land; and just below plough-depth, foundations and ruins lie as thick as can be. The soil's been cleared for farming, that's all.'

I then asked if the cause of this dust-like fineness and richness could be accounted for, but the man shook his head; and after picking up for me some few pieces of the imperishable tiles—of which there are three courses in the wall—he resumed his spade. Unless artificially prepared—a thing scarcely possible for such a depth and extent of land—fire on more than one occasion must have performed an important part in this attrition of the soil, and in reducing its original elements to a state of carbon. It is certainly not unusual to find the lower levels of Roman sites indicating, by the blackness of the soil, traces of extensive conflagration, and countless instances are known to antiquaries; it is only in connection with extreme friability and dryness that the fact here assumes a new and singular aspect. The city was a very extensive one, and a fire may have wasted it for many successive days, and brought down together, in one smouldering heap, both public buildings and domestic dwellings; the profusion of wood-work, which, as it is generally assumed, formed the upper portion of Roman houses, aiding the devastation.

So many conjectures have been made relative to the class of building to which this massive old fragment of masonry may be referred, as prove that antiquaries are entirely at fault. By some it is said to have formed part of a *castrum* or citadel, by others variously as the fragment of a temple, a public granary, or a bath. But there seems little to strengthen the conjecture that it ever formed portion of a citadel, as it does not stand immediately contiguous to the Severn, or any assumed point of defence; though the masonry bears certainly a great likeness to what remains of the Roman *castrums* on the coast of Kent, being stone-work with layers of tiles between at regular intervals. For centuries, moreover, this almost imperishable fragment has been styled by the peasantry of the neighbourhood, 'the old works,' thus pointing to a Saxon nomenclature, and to its traditional use as a military defence.

Be this as it may with respect to its history, there I paced round and round it, on that golden afternoon, very full of thought, and deeply interested. It was plain to see that the old masonry had formed part of an interior wall, and had trended with some building in a somewhat circular form. In the upper portion are holes through it, as though for the support of scaffolding; other brickwork has rested against sections of the lower part, and what is now a mere broken gap through the middle of the wall, has once evidently formed an arch. Two others were distinctly visible about 180 years ago.

Bringing our tiles with us, we left the old wall, and

repaired to the cottage of the labourer I had just been talking to—his wife having a few old coins in her possession, which he had picked up from time to time. These have been found in large abundance on the site of Uriconium; but from what I could hear, and have seen, they have been mostly of comparatively little value—simply small bronze denarii of the period of the lower empire. Occasionally, larger specimens have been found, as one in brass of the reign of Trajan, imbedded in the old wall; but the hoards said to be possessed by many of the villagers have little intrinsic value in relation to either Roman art or history, beyond what association may create, or what the spirit of a kind of Jonathan Oldbuck sort of dilettanteism—namely, a reverence for everything *because it is old*—may impart. With this phase of antiquarian taste, I have not the remotest sympathy; I only value archæology for its power of throwing new light on the historical past; and for shewing, with all its gaps and lost links, how continuous has been the thread of a progressive causation in human history. There can be no doubt that it is these historical bearings that is making archæology the popular study it is at present. Till men have given finality to much of historic truth, this must continue to be the case; and this finality seems to be a very remote thing in relation to British history. Since the publication of the *Faussett* papers, under the editorship of Mr Roach Smith, our greatest Saxon scholar has said that he must in a large measure re-write his well-known Saxon history, as the discoveries made in Saxon graves wholly invalidate many of his theories and assumptions. In like manner, other discoveries will serve to overthrow much which at the present date is mis-called history; and there can be but little doubt that when the archæologists have done a portion of the work which lies for them to do, there will arise—as there always arises when a point of the kind is needed—a special class of inductionists to draw the threads of historic truth together.

When we had chatted a while, the good woman went upstairs, and bringing down a little strip of rag tied about with cotton, produced her 'dinders,' as they are locally called. They were very small; of bronze, much worn, and oxidised. Selecting one, with the inscription illegible, but with the head of a helmeted soldier thereon, very good in its way, and as fresh as though newly from the mint, I made it mine, and we then retraced our steps a short distance in the village, the waning sun giving us warning that we had much to see, and but a brief time for so doing.

Once in the highway and amid scattered cottages, it was plain to see to what use the ruins of Uriconium had been turned. In the walls and porch of the most picturesque of village churches were to be seen fragments of Roman tiles; better-class dwellings, labourers' cottages, pigsties, garden-walls, and the enclosure of a piece of waste land—itsself heaped up with Roman debris—had been alike built out of the same exhaustless quarry; and masses of finely shaped stone-work, which needed no near inspection to shew the still fresh traces of the legionary's gauge and chisel, bounded the road or secured a dung-heap. As was said when the members of the Archæological Institute went over the site of Uriconium in 1856, it seemed to be a matter of necessity that every fragment of a column turned up should be split and formed into a coping-stone for a wall.

A message delivered to us in the early part of the afternoon, invited us to see some remains at a gentleman's house next the church. Proceeding thither, we found on the lawn some noble columnar fragments, pediments, and bases, matching evidently with fragments of the same kind that we saw almost immediately after in the grounds of Mr Stanier. Some of these masses were decorated with a scale pattern, others with the ordinary flute. A portion of these

re placed about a large centre flower-bed, redolent the scent of geraniums and heliotropes, where supported fragments of Samian ware—none of it, rough, of very high quality—broken lamps, Roman vases, and other kinds of pottery. It was singular to find fragments of vessels of the black ware called church pottery at this remote distance from the banks of the Medway; and the fact shews how intimate and constant was the commercial relation between one part of Roman Britain and another. This black hue was effected during the process of baking, and might not have been peculiar as a branch of domestic art to the Upchurch potteries solely, still the pattern and shape gave additional evidence. My opinion is, that the Staffordshire potteries date from a Celtic period, and that in the hands of the Romans, they were extensively worked, and supplied the adjacent districts with a profusion of earthen vessels, that has had no parallel except in our own day. The most unique relic was a red-earth vase of large size, of coarse workmanship and clay, but not rare as to shape. I have seen nothing like it elsewhere, and yet it was undoubtedly Roman; and it has since struck me as very singular, might have most served Wedgwood as a model for one of his peculiar shapes. It is a well-known fact, that our most distinguished English potter was intimate with several of the best antiquaries of his time, and occasionally received presents of Roman ware from Major Rooke and others. Thus, from some source of the kind may have arisen the flanged rimmed vase peculiar to collections of Wedgwood-ware, and so common on shelves of mantel-pieces sixty years ago.

The evening had waned more and more, and twilight was almost come; we therefore gave up all hope of seeing more of the village, and retraced our steps to the Stanier's. That gentleman had not returned, so I did the misfortune of losing the sight of his small but unique collection of pottery. In a *mortarium* in the hall were a few fragments of various-shaped vessels; rough these I looked as well as the fading light could let me, and then hastened to the lawn. Here, about in various places, were still more beautiful fragments of pillars, with their bases and pediments, as any we had yet seen, besides many other massive relics in sculptured stone-work. A sort of alcove on one of the winding terraces leading down to the river was entirely formed by the latter; whilst above it, most covered with ivy, was set a colossal head of one of the Roman deities.

The scenery from this lawn and its terraces is beautiful in the extreme; nothing that I have ever seen of English landscape exceeds it. As I turned away in the softened twilight, the last traces of the sun lying red and there in molten patches on the water and its green-turfed islands, I could but think how, after all, the beauty of nature transcends the art of man; and that if, through the mischances of barbarism and ages of ignorance, treasures were lost to us that neither time nor conjecture could restore, the same magnificent environment was still ours as had witnessed the civilisation of our Roman fathers.

Along Watling Street, through the gloom of the wooded lane, we reached the highway. At Atcham ridge we were fortunate enough to be overtaken by a return chaise: by the aid of this we reached the cheerful light of the town much earlier than we could otherwise have done.

The relics discovered from time to time of Uricoman have been considerable, though too many of them have been scattered and lost. The compass of the city and fortress was about three miles, and within a space such as this, accident, if not research, must have brought countless things to light. Sepulchral remains, hypocausts, moulds for forging money, a coinlet's stamp, have been among the spoil. A

few small bronzes have been found, but from the accounts that have reached us, and from what I have seen, they belong to a debased stage of art. The best things preserved in the museum at Shrewsbury is an altar, formed of the red sandstone of the district. The specimen of a sepulchral urn, enclosed in a case of lead, is likewise most unique and rare.

HUMBOLDT AT HOME.

MR BAYARD TAYLOR has communicated to the *New York Tribune* some very interesting details of a visit he paid to Alexander von Humboldt in November last. While in Berlin, the philosopher lives with his servant Seifert, whose name is on the door of the house, a plain two-story building, with a dull red front, and inhabited by several families. On the second floor there is another name—'Alexander von Humboldt.' Seifert opened the door to the visitor, and shewed him into a room filled with objects of natural history, then into a library, and lastly into the study.

'Seifert went to an inner door, announced my name, and Humboldt immediately appeared. He came up to me with a heartiness and cordiality which made me feel that I was in the presence of a friend, gave me his hand, and inquired whether we should converse in English or German. "Your letter," said he, "was that of a German, and you must certainly speak the language familiarly; but I am also in the constant habit of using English." He insisted on my taking one end of the green sofa, observing that he rarely sat upon it himself; then drew up a plain cane-bottomed chair and seated himself beside it, asking me to speak a little louder than usual, as his hearing was not so acute as formerly.

'The first impression made by Humboldt's face is that of a broad and genial humanity. His massive brow, heavy with the gathered wisdom of nearly a century, bends forward and overhangs his breast, like a ripe ear of corn; but as you look below it, a pair of clear blue eyes, almost as bright and steady as a child's, meet your own. In those eyes, you read that trust in man, that immortal youth of the heart, which make the snows of eighty-seven winters lie so lightly upon his head. You trust him utterly at the first glance, and you feel that he will trust you, if you are worthy of it. I had approached him with a natural feeling of reverence, but in five minutes I found that I loved him, and could talk with him as freely as with a friend of my own age. His nose, mouth, and chin, have the heavy Teutonic character, whose genuine type always expresses an honest simplicity and directness.

'I was most surprised by the youthful character of his face. I knew that he had been frequently indisposed during the present year, and had been told that he was beginning to shew the marks of his extreme age; but I should not have suspected him of being over seventy-five. His wrinkles are few and small, and his skin has a smoothness and delicacy rarely seen in old men. His hair, although snow white, is still abundant, his steps slow but firm, and his manner active almost to restlessness. He sleeps but four hours out of twenty-four, reads and replies to his daily rain of letters, and suffers no single occurrence of the least interest in any part of the world to escape his attention. I could not perceive that his memory, the first mental faculty to shew decay, is at all impaired. He talks rapidly, with the greatest apparent ease, never hesitating for a word, whether in English or German, and, in fact, seemed to be unconscious which language he was using, as he changed five or six times in the course of the conversation. He did not remain in his chair more than ten minutes at a time, frequently getting up and walking about the room, now and then pointing to a picture, or opening a book to illustrate some remark.'

The two travellers talked about the countries they had visited; Humboldt remarking that, like his visitor, he had preserved his health everywhere; and that during five years in South America and the West Indies, he had passed through the midst of black vomit and yellow fever untouched. He gave some advice as to travelling in the Russian-Tatar provinces of Central Asia; and described the

Khirgies as a very interesting people, partly Boodhist and partly Mussulman, their monkish sects following the clans in their wanderings, and performing their religious ceremonies in the encampments within a circle marked out by spears.

The Altai Mountains led him to speak of the Andes, and compare them with the Himalaya, giving the preference to the former in point of grandeur. "You remember Orizaba," continued he; "here is an engraving from a rough sketch of mine. I hope you will find it correct." He rose and took down the illustrated folio which accompanied the last edition of his *Minor Writings*, turned over the leaves, and recalled, at each plate, some reminiscence of his American travel. "I still think," he remarked, as he closed the book, "Chimborazo is the grandest mountain in the world."

'Among the objects in his study was a living chameleon, in a box with a glass lid. The animal, which was about six inches long, was lazily dozing on a bed of sand, with a big blue fly—the unconscious provision for his dinner—perched upon his back. "He has just been sent to me from Smyrna," said Humboldt; "he is very listless and unconcerned in his manner." Just then the chameleon opened one of his long, tubular eyes, and looked up at us. "A peculiarity of this animal," he continued, "is its power of looking in different directions at the same time. He can turn one eye toward heaven, while the other inspects the earth. There are many clergymen who have the same power."

The conversation then turned upon American affairs, with which Humboldt appeared to be quite familiar. 'He also spoke of our authors, and inquired particularly after Washington Irving, whom he had once seen. I told him I had the fortune to know Mr Irving, and had seen him not long before leaving New York. "He must be at least fifty years old," said Humboldt. "He is seventy," I answered, "but as young as ever." "Ah!" said he, "I have lived so long, that I have almost lost the consciousness of time. I belong to the age of Jefferson and Gallatin, and I heard of Washington's death while travelling in South America."

'I have repeated but the smallest portion of his conversation, which flowed on in an uninterrupted stream of the richest knowledge. On recalling it to my mind, after leaving, I was surprised to find how great a number of subjects he had touched upon, and how much he had said, or seemed to have said—for he has the rare faculty of placing a subject in the clearest and most vivid light by a few luminous words—concerning each. He thought, as he talked, without effort. I should compare his brain to the fountain of Vaucluse—a still, deep, and tranquil pool, without a ripple on its surface, but creating a river by its overflow. He asked me many questions, but did not always wait for an answer, the question itself suggesting some reminiscence, or some thought which he had evident pleasure in expressing. I sat or walked, following his movements, an eager listener, and speaking in alternate English and German, until the time which he had granted to me had expired. Seifert at length reappeared, and said to him, in a manner at once respectful and familiar: "It is time;" and I took my leave.

"You have travelled much, and seen many ruins," said Humboldt, as he gave me his hand again; "now you have seen one more." "Not a ruin," I could not help replying, "but a pyramid." For I pressed the hand which had touched those of Frederick the Great, of Forster, the companion of Captain Cook, of Klopstock and Schiller, of Pitt, Napoleon, Josephine, the marshals of the Empire, Jefferson, Hamilton, Wieland, Herder, Goethe, Cuvier, La Place, Guy-Lussac, Beethoven, Walter Scott—in short, of every great man whom Europe has produced for three-quarters of a century. I looked into the eyes which had not only seen this living history of the world pass by, scene after scene, till the actors retired one by one, to return no more, but had beheld the cataract of Atures and the forests of the Cassiquiare, Chimborazo, the Amazon and Popocatepetl, the Altaian Alps of Siberia, the Tatar steppes, and the Caspian Sea. Such a splendid circle of experience well befits a life of such generous devotion to science. I have never seen so sublime an

example of old age—crowned with imperishable success, full of the richest wisdom, cheered and sweetened by the noblest attributes of the heart. A ruin indeed! No: human temple, perfect as the Parthenon.'

G O N E.

List to the midnight lone!
The church-clock speaketh with a solemn tone:
Doth it no more than tell the time?
Hark, from that belfry gray,
In each deep-booming chime which, slow and clear,
Beats like a measured knell upon my ear,
A stern voice seems to say:

Gone—gone;
The hour is gone—the day is gone:
Pray.

The air is hushed again,
But the mute darkness woos to sleep in vain.
O soul! we have slept too long,
Yea, dreamed the morn away,
In visions false and feverish unrest
Wasting the work-time God hath given and blest.
Conscience grows pale to see
How, like a haunting face,
My youth stares at me out of gloom profound,
With rayless eyes blank as the darkness round.
And walling lips which say:

Gone—gone;
The morn is gone—the morn is gone:
Pray.

Wo for the wasted years
Born bright with smiles, but buried with sad tears!
Their tombs have been prepared
By Time, that graveman gray—
Soul, we may weep to count each mournful stone,
And read the epitaph engraved thereon
By that stern carver's hand.

Yet weep not long, for Hope,
Steadfast and calm, beside each headstone stands,
Gazing on Time, with upward-pointing hands.
Take ye this happy sign,
Up! let us work—and pray.

Thou, in whose sight the hoary ages fly
Swift as a summer's noon, yet whose stern eye
Doth note each moment lost,
So let me live that not one hour misspent
May rise in judgment on me, penitent,
But, till the sunset, Lord,
So in Thy vineyard toil,
That every hour a priceless gem may be
To crown the blind brows of Eternity. M. A.

ANTIQUITY OF BLACK-PUDDINGS.

Even black-puddings were not only tolerated, but fashionable; and when the throat of the ox was, as we cut nearly from ear to ear, the blood was caught to use a dish which was thought worthy of figuring in the kitchen of King Remeses. The mode of cutting the throat is required, by Moslem law, in Egypt; but to eat the blood is unlawful. It was this custom of the country they just left that made the Hebrew legislator so often rebuke the Israelites against eating the blood of animals; while some of the Mosaic laws were in accordance with patriarchal habits of their forefathers, many were directed introduced in order to correct abuses they had adopted during their sojourn in Egypt.—*Wilkinson's Egyptians, the Time of the Pharaohs.*

'GLIMPSSES OF AFFAIRS IN AMERICA.'

Circumstances have obliged us to defer till next week
Glimpses prepared for the present Number.

Printed and Published by W. and R. CHAMBERS, 47, North Row, LONDON, and 289 High Street, EDINBURGH.
Sold by JAMES FRASER, 14 D'Olier Street, DUBLIN, and Booksellers.

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 168.

SATURDAY, MARCH 21, 1857.

PRICE 1½d.

BY THE BEDROOM FIRE.

I HAVE heard people, in talking of their dreams, tell how there is one particular Appearance that comes over and over again, under some special circumstance; and how, let them do what they will to ward it off, yet so surely as they lie down under the influence of such circumstance, so surely does the same figure arise in the same places, and enact anew the fragmentary drama, never to be finished in this world. When I say 'ward off,' I mean that, just by way of experiment, they sometimes try what power they have to put it aside. I do not wish to infer that they have in general any horror of it; I think, on the contrary, they would be sorry to part with it. It is something so peculiarly their own, that it gives them an importance, resembling that of families who are distinguished enough to have a ghost or banshee; and I am sure they like to tell about it more than anything.

Although I am myself one of these people, I am different from them in a single respect, for I have never yet spoken to any one of a dream I have had for some time now. It was only last night, that awaking from it as the winter storm swept by the house, and wondering whether any one similarly situated had ever experienced anything like it, I determined to set it faithfully down, word by word, just as it happens. It is always in one place this vision comes to me, and at one time—in my own bedroom, sitting in a low chair beside the fire, which, with flameless, palpitating glow, makes a low dream-light in the chamber. Then, when the house is quiet—when the wind goes souging by—when the little kettle upon the hob makes its low purr—when the firelight is dimly reflected at great depths in the polished dark old furniture—when I have put on a particular white dressing-gown with wide hanging sleeves and loose neck—and when my hair falls down after the fashion of my girlhood—it is then I find myself face to face with this dream-figure. So quietly it steals in, as if it were some invisible limning within my heart which the sacred home-fire drew forth to palpability upon the surface, that I am unconscious when it first comes to me. I can feel it with its little face upon my bosom long before I look at it with my happy dimmed eyes; and it seems to me as if the star arose over my dwelling as it shone from heaven, ages ago, upon the young child and his mother, hallowing for ever since then the holy cradle of a mother's arms.

I am agitated by no surprise when I first see it, and yet my heart beats fast. It seems to me as if all that had ever been pure and peaceful in my own life—all my hopes, all my loves, all the love I ever felt or

could feel, lay concentrated there before me; as if I had no longer anything to desire; as if my very soul, purified, lay calmly sleeping upon my knees. I am sure if I have any distinct feeling at all, it is that I could die for it: whatever else is in my mind, that is uppermost—I could die for it; and as this thought comes, another dream seems to rise within my dream, full of wild, incoherent passions of defence: of struggling with armed men, as mothers did in the days of Herod the Tetrarch—of buffeting with the waves—of being torn by savage animals—of flying with bare and bleeding feet, and streaming hair, through the wild night, and holding it ever to my bosom as my exceeding great reward; for the moment the vision comes, it brings me a fierce strength, such as does not belong to my nature, which is indeed but weak and timid.

From these nightmare fancies I am recalled by a whole series of operations, in which I treat my dream-figure with a familiarity to be accounted for only as a dream inconsistency. I hold him in no more reverence than if he were the waxen baby I used to play at love with. I splash him and puff him; I battle it out with him, with quite a ludicrous sense of my power: the self-assertion of his kicking and crying affords me the most intense amusement through all my flurry. I make no more of compelling his rebellious little fat arms in and out of all sorts of intricacies, than if I were the Brobdignag nurse I read of in the story-book long ago. I will have everything about him my own way—smooth and neat, and folded over and tucked in. I am firm in my notions regarding his figure, and finish him off with three yards of bandage, like a young mummy. I never relax a string in the matter of the night-gown, but overcome him with it like a shower-bath of calico, from which he emerges red and shining, and turn him over on his face with an unsympathising imperturbability that seems almost fiendish in its heartlessness. After this final struggle, I have conquered, and have only to fix my flag of victory upon his head, by inserting it into his little crimped night-cap, which, with all the letting out of running-strings, is, I am proud to say—I say so to myself—'growing too small for him.' So, the cruel task over, my tender-heartedness returns, and with his little hands wandering about my neck—with the fire-light enwrapping us both in its genial glow—with the kettle singing its low lullaby—with the wind passing on its mysterious course, he sleeps his sweet sleep. 'And they brought young children to Him that he might bless them.' These are the words I always hear as I watch at such a time, addressed, as it were, with something of tender reproach to myself, and telling me that, guided by the little innocent hand, I

too, may come to the golden gate, and receive a share of the blessing.

If there is one thing I am more proud of than another about this dream-darling of mine, it is his feet—always excepting his hair. Indeed, these two points of excellence, belonging to different periods of the dream—for many years lie compressed within the fantastical hour—I rather dwell upon each exclusively in turn. Thus, when first he comes to me, I almost blush to recall the childish delight, the thrill of joy afforded me by the sight and touch of the little rosy warm feet, that have never trodden the wicked earth. How I watch them basking in the genial fire-glow—how I kiss them, and fondle them—how it is happiness enough to hold them both within my one hand, and to feel they live!

A little later, and his hair becomes his strong point—that tiny scrap of silken hair that just emerges from his cap. Never was there such a love-lock! It is smoothed down, parted on either side, parted on one side: there is no end to the fashions this morsel assumes, until it grows beneath my hand, and clusters in thick chestnut curls upon the boy's head. After this, the feet retire into complete obscurity, never being visible out of red shoes, blue shoes, sandalled shoes, and so on, but once—that is, while he is still a little child, and kneeling in his bed-gown, with flushed cheeks and bare feet, at my knees, lisping my name in his evening-prayer.

Soon after this innocent prayer, I cease to see myself. I perceive all that is going on equally well, but I no longer have any connection with the scene: I am oppressed with a dreadful feeling of helplessness, and long to cry out and awaken. With an agony of entreaty, I try to fold the child in my arms, but they restrain him no more than the air. I struggle frantically even to touch him—to speak to him one word—to let him know that his own mother stands beside him. But the wind that goes whispering by bears away upon its wings my dull dumb moanings; the flickering fire-light traces no shadow of my outstretched hands. At this particular passage of my dream, a picture that really hangs in my husband's study always shapes itself out of the thickening shadows. It is one of myself: a pale, sad face, with heavy eyes, not pretty, with no happy smiles and bright bloom, such as win children's love; and as they say to the boy that it is his mother's picture, I could find it in my foolish heart to weep bitterly that the painter had been so faithful—that he had not traced fresh joyous beauty, radiant eyes, and star-encircled hair, so that the boy should think of a guardian-angel whenever he thought of his mother. This is, I think, at once the most sharply defined and the silliest part of my vision; and soberly awake, I am ashamed to know that it is always here my tears flow with an unvarying certainty.

After this, it seems as if the doors that had shut us in together, opened on every side, and admitted strangers, the one who has taken my place in the house, even wearing things that I well know. She is a lady with a stately presence, and with but cold looks for the little ones I see gathering around her, an ill-restrained impatience of the lonely child in the distance. From this I generally fall into a dull torpor of unutterable distress, and see things for some time with all the hurried flitting, meaningless gatherings and dispersings, intangible shifting and general incoherence of dream-scenery: but in them all is the boy. He is a fine manly fellow, with a grand head and proud dark eyes; something about his mouth, too, of almost girlish sweetness, but as he grows up, settled into stern compression. For he grows up in this dream of mine—past the unloved childhood—through the dull school-days, unchecked by the bright intervals of home, that mark the year to other

children with so many distinct epochs of happiness whereby to calculate the flying months—on into his premature manhood; so tall, that it does indeed seem a wild fancy that I could ever have borne him in my arms; so care-worn in this his early youth, that none but a mother's eye could detect the lingering traces of his childhood's innocence and repose.

I do not know my son's age. In this wild confusion of time, it gives me no astonishment to walk with him at one moment a little lad, with open collar and white throat, dusty worn-out shoes and bundle, trudging along the high road, and turning his face from his father's house for ever; and the next, to stand beside him in his poor chamber, a lonely dejected man, over whose head years of disappointment have swept. And from this time I never lose sight of him continuously. By the dying fire-light, in the flickering gleam of his student-lamp, when the wind lifts up its voice and howls like a ravening animal waiting for its prey without—through the dreary nights when, like the Galilean fishermen, he toils in great depths vainly—then it is given me to stand beside him—to lay my shadowy hands upon his aching head to soothe him, all wayworn as he is with his world-pilgrimage, into rest, to arise in his dreams from the far-off years, and bless him with the holy mother-love.

Here, as I do in my vision, I must stop abruptly. From this point, it seems to me that a mist gradually intervenes between us, making things behind at first vague, and by degrees stealing upon their very outlines, and so blending them into an even darkness. Nor does this fading out of the details of my dream-fancy occasion me pain. In proportion as I see less clearly, the keen sympathy of my interest decreases, and returns from following the fortunes of the child to a mere consciousness of unspeakable love lying dormant within my bosom; and this love brings him back quite naturally, and without mental effort, to my arms, a little, tender, helpless, sleeping thing, just as I see him first. My dream thus always commencing and terminating in the same way, has led me to speak as if it were unvaryingly throughout the same, which is not the case. Indeed, why I should have selected such gloomy circumstances to surround him with, in preference to the many bright and joyous ones I see him as often the hero of, I do not know, except that, unconsciously, I have been influenced by a kind of vanity in setting down those that seemed most romantic amongst my silly fancies, or from the common instinct that makes a child of sorrow dearer to a mother, as I have heard mothers say, than any of her happy ones.

So, with a start, I awake. I am still sitting in the same place, but my fire-light has died into the darkness. It is cold and cheerless. I creep to my bed, and, like Rachel, weep for my children because they are not.

GLIMPSES OF AFFAIRS IN AMERICA.

MANŒUVRING.

SQUATTER sovereignty!—shall it exist or not, is the question which for half a century has perplexed and demoralised American statesmanship, and will do so apparently for some time to come. Calhoun is said to have been the first to use the term 'squatter sovereignty' in joke, though no joke has it proved to congress; but Cass is alleged to have had the high merit of giving it a place in serious parliamentary nomenclature, and so conferring upon it an air of official respectability. We do not absolutely pledge ourselves as to the authorship of either of these distinguished statesmen; nor does it much matter. Squatter sovereignty is no new thing. We have referred to it again and again, as the alleged right of the inhabitants of the newly organised territories of

the Union to make choice of their own institutions. Now that choice is for the most part a foregone conclusion, as regards slavery, is already explained. An early rush of planters with their slaves usually settles the business, before the more slow-moving and free-loving emigrants enter on the scene. Yet, the question is still contended for in congress, that the inhabitants are entitled to exercise precisely the same right of assuming or rejecting slavery as are the citizens of any of the constituted states. In short, does the constitution confer on congress an arbitrary control of the territories? The circumstances which have been narrated in these papers, would entitle us to say that congress rightfully possesses this authority. People who do not keep quite abreast of great social questions, probably imagine that the contest about slavery in the United States refers to emancipation or non-emancipation. Except by the inconsiderable party of abolitionists, the struggle has not taken place within 'a long chalk' of this ultimatum. The subject and present subject of debate, is what is to be done with the territories, which are from time to time absorbed into the Union. The South, which has a knack of carrying statesmen and presidents along with it—no matter where these personages are 'raised'—argues strongly in favour of squatter sovereignty; or the good reason, that it can fabricate pro-slavery matters to any desired amount. The North, on the other hand, which talks heroically about freedom in a Faneuil Hall, its Tabernacles, and what not, and is clear that at least all territories on the northern side of 36° 30' should be for ever free from slavery, its a poor figure when it comes to voting. In plain terms, it allows itself to be mystified—sends, among few brilliant exceptions, so many self-interested persons to congress, that all 'who are not identified with slavery or democracy are naturally disgusted'—and as, to end the matter, the South gets pretty nearly its own way.

Ever since the battle of the territories began, nearly fifty years ago, there has been a continual reckoning of gains and losses between South and North. On our conscience, we believe that the question of slavery is never, as a general rule, been seriously entertained by the great northern orators in congress. The thing which was really fought for—as, for example, in the magnificent speeches of Webster—was political power. The South, with the peculiar energy it has usually employed, were to secure a disproportionately large number of states, the North would relatively sink in member-creating capacity; and losing in members, would lose in chances of place as well as of the many good things which issue from the federal treasury. Unless one is pretty well 'posted up' in the story of these party manoeuvres, he can hardly comprehend the actual merits of the squatter-sovereignty discussions.

Slavery, once simply a social and seemingly temporary evil, has, through the course of events, of which we have presented a summary, become a great political institute, within which is intrenched an oligarchy that holds the balance of power, and is, in effect, the government. Undoubtedly, the primary cause of its preponderance is the constitution of the United States, which is eminently conservative of slavery, and, as usually interpreted, has afforded grounds for greatly extending this odious institution. In that constitutional arrangement alone, whereby slaves form an element in apportioning the ratio of representation to population, a ground was laid for the political grandisement of the South. As formerly stated, one-fifth of all the slaves in the United States are numbered in the constituency for the House of Repre-

sentatives, though not one of them has a vote. Three out of every five slaves in the South, are thus equivalent to three freemen in the North; and practically, by this singular method of making up a constituency, the South gains thirty votes in the House of Representatives beyond what it would otherwise be entitled to have.

It is worthy of remark, however, that, notwithstanding this remarkable advantage, the South is not able to keep pace with northern constituencies. By the last decennial census, on which the present representation is based, while the free states contribute 145 members, the slave states return no more than 90. How, then, being in such a minority, is the South able to exert so extraordinary an influence in the national legislature? The explanation involves some strange disclosures. In the first place, the South uniformly acts with an *esprit du corps* totally wanting in the North. The constituency of the slave states is, in point of fact, narrowed to about 350,000 slave-owners, in whom power is entirely reposed; the surplus of southern white population being little better than a nonentity. A body so limited acts with a vigour and unity not to be attained by the many millions of northern freemen. Throughout the South, free labour is dishonourable, and the business of life is politics: the universal consideration is the attainment and retention of power. The North, on the contrary, is a hive of industry, in which there is little time to devote to political stratagems, and unfortunately the people, generally, are so much under the dominion of material interests, as well as prejudices respecting colour, as to be easily misled by deceptive party representations.

Accustomed as we are to associate slavery and its multifarious horrors with the doings of the South, one is apt to neglect the important truth, that but for the selfish compromises of the North, slavery must long since have been extinct. No fact has been more conclusively proved than that the existence of this monster evil depends on territorial aggression. Seclude it within a certain circle, and it will inevitably perish. Slavery is synonymous with waste. It is a waste of means, a waste of land, a waste of civil liberty, a waste of moral feeling—everything deteriorates in connection with it. As an institution, it has drawn its vitality from the rich lands lying beyond the borders of the Old Dominion. We could present no more striking evidence of its ruinous effects on land than those instanced by Mr Olmsted in his two dispassionately written works on the slave states. In the latest of these productions, *A Journey Through Texas*, he speaks of that frequent and melancholy spectacle in the older slave states—an abandoned plantation of "worn-out" fields, with its little village of dwellings, now a home only for wolves and vultures. This but indicates a large class of observations, by which I hold myself justified in asserting that the natural elements of wealth in the soil of Texas will have been more exhausted in ten years, and with them the rewards offered by Providence to labour will have been more lessened than, without slavery, would have been the case in two hundred. Do not think that I use round numbers carelessly. After two hundred years' occupation of similar soils by a free-labouring community, I have seen no such evidences of waste, as in Texas, after ten years of slavery. And indications of the same kind I have observed, not isolated, but general, in every slave state but two—which I have seen only in parts yet scarcely at all settled. Moreover, I have seen similar phenomena following slavery in other countries and other climates.

The effects of this wastefulness of land, are of national concern. Present existence is secured by drawing on future resources. To after generations, bread, meat, cotton, and other articles will all be enhanced in cost by the present system of territorial

• *Why Policy Assailed and Illustrated.* By Josiah Quincy. Boston, 1855.

exhaustion. 'I consider,' adds this writer, 'that slavery is no less disastrous in its effects on industry—no less destructive to wealth. The laws and forces sustaining it, where it has been long established, may become a temporary necessity, as poisons are to the life of some unfortunate invalids. But laws intended to extend its field of improvidence are unjust, cruel, and oppressive.' If slavery be so ruinous, why should it be continued? It is tolerably evident that the buying of labourers, instead of hiring them, must be a most extravagant method of cultivating lands. Olmsted shews how capital is needlessly absorbed by investments in slaves, and that on this account alone the South deprives itself of vast means of improvement. But independently of the profits derived by Virginians in raising and selling slave-stock, there are powerful reasons why slavery is maintained and contended for.

The first of these reasons is the inordinate love of power. Reared in the uncontrolled exercise of authority, the slave-owner will submit to many inconveniences and even loss of profit, rather than tolerate what he considers the arrogance of an independent labourer. To ask a servant to do a thing instead of ordering him, is intolerable. The idea of hired labourers presuming to have rights, is repugnant to southern notions. Those who degrade themselves with labour, are bound to submit to any kind of treatment. The reckless homicide of a waiter at Washington by a member of congress from Alabama, in the spring of 1856, was, for example, justified by southern newspapers, on the ground that it was proper to teach free labourers their place. Another reason for sustaining slavery, is the status which is derived from the possession of negro property. The owning of even one slave raises a person in southern society, although the possessor of this miserable piece of property is under the necessity of hiring it out for his own subsistence. Addressing a southern man, Olmsted says: 'It is fashionable with you to own slaves, as it is with the English to own land, with the Arabs, horses; and as beads and vermillion have a value among the Indians which seems to us absurd, so, among you, has the power of commanding the service of slaves. Consequently, you are willing to pay a price for it which, to one not educated as you have been, seems absurdly high. Nor are you more likely to dispense with slaves when you have it in your power to possess them, than the Chinese with their fashion of the queue, Turks with their turban, or Englishmen with their hats.'

Wrong in principle, and in all respects ineconomical, as compared with free labour, slavery is on all hands acknowledged to exist only by fraud and violence, by disregard of the rights of citizens, by suppressing freedom of discussion and freedom of election, by preventing general education, by interrupting and annoying commerce, by exhausting lands, dishonouring industry, checking public improvements, degrading the national character, and, in short, by establishing an almost universal terrorism, unworthy of a free people. The dexterity with which these enormities have been sustained, is exceedingly marvellous. A few facts must be plainly stated. Practically a despotism, the great slavholding interest, with far-sighted policy, professes those extreme principles of democracy which are upheld by the larger proportion of northern citizens—much as if the high conservative body in England were, for party purposes, to declare for extreme radicalism. Northern men, on the other hand, seek to conciliate the South, for the sake of selfish interests. The doctrine that high protective duties are an essential element of national prosperity, though long since exploded by political economists, is still current in the northern states of the Union. Doubtless, it is only through the efficacy of such protective duties as 80 per cent., that certain northern manufacturers can keep open their establishments; and we may

assume that if these restrictions were removed, much misdirected capital would flow into more natural channels, and produce results more advantageous to all parties. Northern manufacturers, however, being the immediate gainers by so preposterous a system of protection, cling as closely to the privilege of taxing the community as ever did the landowners of Great Britain by their restrictions on the free import of food. Such prepossessions could meet with no response in the South, but for the necessity of buying party support. All the clothing, shoes, hats, and other articles required on southern plantations, are imported coastwise from northern manufacturers; so that, in reality, the South taxes itself in an enormous sum annually, in purchasing dear northern goods. 'Up to the present moment,' says an American writer, 'the North has been a commercial and equal partner with the South in all the material values or pecuniary results produced by slavery. In the first place, the great southern staples, cotton, tobacco, and rice, with their vast valuation, constituting virtually the commercial currency between America and Europe, have mostly passed through the hands of northern merchants and factors, enriching them with lucrative profits. Then slavery rendered the southern states dependent upon the North for all the manufactured articles they used; from parlour books to kitchen brooms; from beaver-hats for the master to the coarsest chip-hats for the slave; from penknives to ploughs. Nearly all the goods they used were either manufactured or imported for them by the North. Their teas, coffees, and other foreign productions either came to them through New York, Philadelphia, or Boston, or were brought to them direct from across the sea in northern ships. The factories and ships of the eastern states and the fertile prairie lands of the west, teemed with the industrial activities which these important staples employed and rewarded. What three millions of slaves grew under the lash in the South, made a continuous and profitable business for at least twice that number of freemen in the North. The latter, by that species of compromise for which it has been distinguished, grasped at the lion's share of the dividends of this commercial partnership. It coveted to sell to the southern states, far more than it purchased from them. If they would only consent to a high protective tariff, which would give their market for manufactures exclusively to the North, anti-slavery agitation in the free states should be put down and extinguished. The mobbing of "abolition agitators" in Boston, New York, Philadelphia, and other northern cities, was a part of this business transaction—a small instalment of the purchase-price of protection.* The case then stands thus: the South pretends to be democratic, to gain northern votes; and the North sells itself for southern money. Or, to come to the subject in hand—the South votes for Protection, and the North in return votes for Slavery.

Slavery, at least on its present footing, may therefore be said to exist, in some degree, on commercial protection. It is not to be supposed that the South is unanimous in submitting to this thralldom to northern interests. At the risk of breaking up the mutual understanding, southern orators and newspapers have strongly advocated free-trade with Europe, and numerous have been the projects to establish southern harbours, shipping, and commerce—all, of course, impracticable, on account of want of capital as well as want of business calculations and habits. Did the South really find it safe to break with the North, it would, perhaps, with its legislative influence find little difficulty in forcing free-trade measures; and from present appearances, acts of congress will take this direction.

* *Plan of Brotherly Copartnership.* By Eliza Barritt.

It can admit of little doubt, that as protection is relaxed, so will a material cement between North and South be dissolved—an event so far favourable to the interests of freedom. But as long as the principles of democracy are in the ascendant, the anti-slavery party will not have great cause to rejoice. According to the confession of political faith, demonstrated in recent elections, democracy signifies the vindication of squatter sovereignty, the boundless extension of the Union, and, consequently, the illimitable addition of new slave states. Can such principles be carried out? Are they not of a character with all that has been tolerated since the acquisition of Louisiana? It is confidently expected that the rising and somewhat formidable opposition presented by the republican party, will interpose to prevent the further spread of slavery. But this, we fear, is only one of those idle expectations, with which the less sophisticated part of the nation has been long deceitfully amused. The South has many methods of disarming opposition. It can threaten dissolution of the Union, and that no one can endure; for devotion to the Union is a predominant sentiment with every American. By its vigorous action, the South can retain possession of power, and so effectually does it swamp the majority of free-state votes in congress by means at its disposal, that it laughs to scorn the efforts of disunionists and abolitionists.

Referring to the change of sentiment on the subject of slavery in the North, Mr Quincy, whom we have already quoted, shews how, step by step, the principles of freedom have sunk under party influences. Soon after the adoption of the constitution, he says, 'a change of feeling began to spread in the free states, in which, from envy, jealousy, rivalry, ambition, and other passions, parties arose, of which the slaveholders had the tact to avail themselves. . . . It was the mutual interest which resulted from the alliance between slavery and democracy, that at first softened, and in time changed, in Massachusetts, the early, inherent detestation of negro slavery. This change did not extend beyond the democratic party. But after the lapse of twenty or thirty years, another element of slaveholders' influence was introduced. In the course of these years, the profits arising from the cultivation of cotton in the southern states, changed the opinion of the rich planters concerning the evil of slavery, which at first began there to be considered as a good, and then subsequently as a chief good. A like change, contemporaneously, came over the free states, in certain localities, where cotton-spinning and cotton-weaving began to be a source of wealth, and consequently of political power. This interest acquired strength with time and prosperity, and began to be a predominating influence, about the period the Whig party was formed, constituting in truth the chief part of its cement. It was formed out of the broken materials of the old parties, which time and circumstances had dissolved, and was composed of recently fledgling politicians, with a mixture of some democrats and some federalists, who joined the new party, not because its principles were to their mind, but because it was the best in the field. It took the name of Whigs, not from any affinity with those of the Revolution, but because the name had a savour of liberty, and thus formed a convenient cover for those whose interests led to the support of slavery. Boston became one of the localities where the head-quarters of the Whigs was established, and of course became identified with the cotton-spinning and cotton-weaving interests. Here, therefore, the interests of the slaveholder were espoused with zeal, under the guise of upholding the constitution of the United States, of which the provision for returning runaway slaves began to appear as a most important feature.'

And so, by general confession, the protracted and seemingly high-souled contest to check the progress of

slavery, has been only a disguise under which to advance the interests of party. We are, in fact, to understand, that until the present time, the great thing held in view, is the power of returning members to congress to suit particular purposes, and that slavery has never clearly attained the position of a substantive question—scarcely been ever anything else than a convenient sham. On the seizure of Texas, and afterwards on the outbreak of the war with Mexico—whenever fresh territory for slavery purposes was to be added to the Union—the Whigs blazed forth 'Resolutions,' about 'the duty of the free states not to submit.' But with the firing off of these wind-guns, 'the clamour, the courage, and patriotism of the Whigs oozed away;' and on each occasion, when the special object for noisy demonstration was one way or other set at rest—as has been recently exhibited in the case of Kansas—down sunk all ebullition of public, or more properly, party sentiment. Are the modern republicans to be more sincere and trustworthy than the now 'fossilised' Whigs? We know not. Avowing a merely defensive policy, they have disclaimed any intention to interfere with southern institutions; and looking at the past, we may be pardoned for not entertaining high expectations of what is to ensue should they get into power—an event in itself doubtful. Meanwhile, strong language is occasionally used by 'free-soilers' in and out of congress, denunciatory of slaveholders, and we always seem to be on the eve of something being done to put an end to slavery. Alas! after talking and scheming for the last fifty years, slavery is more vigorous and lifelike than ever. According to the well-known ratio of increase—about 150,000 per annum—the present number of slaves in the United States cannot be fewer than 4,100,000, shewing an addition of 900,000 since 1850. We think it may be safely averred that party manœuvring has had a fair trial and been found wanting. Slavery is to be abated neither by abuse, nor by selfish political partisanship. The free states, if they feel inclined, may appoint representatives in congress who could shiver the principle of squatter sovereignty to atoms, and so reduce slavery to a local institution, preliminary to its extinction. How, in the aggregate, they have failed to do so, let late elections testify.

W. C.

CANONBURY TOWER.

EVERYBODY who has, upon either business or pleasure, wandered to the northward of London, will probably have seen the queer old square brick building which bears the name heading this article. A noticeable old place it is, with its little latticed windows, each one on a different level; its formal row of iron railings round the roof, and its melancholy weather-cock crowning the summit; and it appears all the more curious contrasted with the pretty modern villas which now hem it in on every side. All its ancient friends have one by one departed; and there is not remaining near it one of the many structures which surrounded it upon its erection in the reign of 'Bluff King Hall.' The tower of Islington old church—not much unlike itself in shape and general appearance—for many a long year kept it company in overlooking the country around, and made so sturdy a resistance when its demolition was attempted, that gunpowder had to be employed by the Goths who levelled it; but now that is gone, and the old tower is left alone in its glory.

Many mutations had the noble Canonbury House, of which this is the only remaining portion, undergone ere it was destroyed to make way for the more modern buildings, which have, with mushroom-like rapidity, sprung up upon its site. Up to 1539, it was a goodly edifice, belonging to the priory of St Bartholomew, established as early as the middle of the thirteenth

century in West Smithfield—a sort of country-house, in which the prior himself, together with some of the more favoured of the monks, passed the pleasant part of the year, leaving it when winter set in for their more cozy habitation in Smithfield. Very holy men, and very highly esteemed, were these same friars of St Bartholomew, and vastly were their prayers sought for by the laity around; hence the priory of Canonbury became richly endowed with divers gifts of lands and fair dwellings—not the most inconsiderable of which was a noble bequest made in 1334 by Henry le Hayward and Roger de Creton of 110 acres of arable-land in 'Ildon and Kentyshilton' (Islington and Kentishtown) for prayers and masses to be said for the repose of the soul of their kinsman John de Kentyshilton. And so the old monastery went on for many years, increasing in wealth and extent, until one fine autumn morning in 1539, down came the royal mandate for the suppression of the 'religious house;' and amid wo and lamentation, inventories were taken of jewels and rich stuffs—altars were despoiled of their trappings, shrines of their adornments, and all the long-boarded riches of Canonbury Priory were handed over to the king. The unfortunate monks, turned adrift upon the world, were pensioned off: the sub-prior had L.15 a year awarded him, and of the rest, some had L.6, 18s. 4d., and some L.5 apiece.

Henry did not long keep the desecrated priory in his own hands, but gave it next year, together with the lands belonging to it, to the keeper of his privy seal, Thomas Lord Cromwell, upon whose decapitation, in August of the same year, this portion, together with all the rest of his property, reverted to the crown.

The house and manor remained for many years the property of the sovereign, who put a keeper in it, with directions to 'keep it sweet and clean, and entirely meet for the king's use when he chose to come thereto;' and who paid yearly L.20 to the Lady Anne of Cleves for permission to live on the manor.

This state of affairs continued with little alteration until the reign of Edward VI., who made over the whole of the property to John Dudley, Duke of Northumberland; and, as if some fatality was connected with the place, its noble owner was attainted of treason, and beheaded a few months afterwards.

Falling again into royal hands, the old dwelling was presented to Thomas Lord Wentworth, who, in 1570, alienated it to a certain John Spencer, whose daughter, marrying with the second Lord Compton—as we shall presently more fully notice—brought the estate into the possession of the family of its present noble owner, the Marquis of Northampton.

Master John Spencer, nicknamed 'rich Spencer,' or, as he subsequently became, Sir John Spencer, albeit not of gentle blood, for he was a citizen and cloth-worker of London, was yet esteemed the richest man of his time in Queen Elizabeth's dominions. Having been respectively alderman and sheriff, he became, in 1594, lord mayor of London, and earned great glory by his prudent conduct during a fearful famine which occurred in his mayoralty. He did not often live at Canonbury in the busy days of his life, for it was then esteemed a long way from the metropolis; the roads were bad, and infested with robbers; and, besides, Sir John had a noble mansion in the city, no other than Crosby Hall, in Bishopsgate Street. When, however, old age prevented him from taking any part in the active duties of a citizen, the old knight retired to Canonbury, and lived in great dignity and splendour there, and once had the honour of entertaining his royal mistress, who, one summer afternoon in 1581, rode northward to take the air, and stopped and 'ate fruits and drank ale at the fair manor of Canonbury.'

The fame of the knight's great wealth was not confined to England, but reached the continent, and

framed the bold attempt of coming over to England and carrying away the rich man by night to France, in order to obtain a large ransom for his restoration. The shallop in which these worthies sailed came as far as Barking Creek, where six of the pirates left her, and came to Islington; but fortunately for himself, Sir John was not at his house at Canonbury, having been summoned the same day to St James's, and so the robbers were forced to return empty-handed.

A splendid funeral procession was that which issued from the old tower when the doughty knight was gathered to his fathers; and bitter was the mourning, especially among the poorer portion of the inhabitants round about, for Sir John was a very father to those who solicited his charity. More than 1000 poor people followed the body to the grave, and 320 of them, by the express direction of the deceased knight, received what was in those days conceived to be a handsome remembrance. What this remembrance was, it may perhaps interest the reader to know; and so here follows the quaint old account of the matter: 'There was made choice of 320 men and women, poor and old, the which were every of them neighbours living about; and to them severally was given a basket, in the which basket there was contained divers good commodities—that is to say, a black gown, four pounds of beef, two loaves of bread, a little flask of wine, a candlestick, a pound of candles, two saucers, two spoons, a black pudding, a pair of gloves, a dozen of points, two red herrings, four white herrings, six sprats, and two eggs, the which gave every of them who did receive the same, great contentment.'

We cannot at the present day very well estimate the exact amount of Sir John Spencer's wealth; but besides landed and personal property to a very large extent, his executors found among his papers bonds to the amount of L.133,000.

From the rich knight, Canonbury House passed into the possession of a lady—Elizabeth Spencer, Sir John's only daughter and sole heiress. Of course the lady, or perhaps, to speak more correctly, her wealth, was very much courted; and we have accounts of more than one fatal duel being fought in and about Islington respecting her future destiny. Being under age, she was in the protection of the Court of Chancery, and placed by the then chancellor under the care of one or two strict old duennas in Canonbury House. Among her numerous admirers, however, she numbered one—William, second Lord Compton, who turning over in his mind divers salutary maxims, among which 'None but the brave deserve the fair,' and 'Faint heart never won fair lady,' were doubtless prominent; and being nothing daunted by the seeming impregnability of the castle in which the rich beauty was confined, or by the grim custodians who had the charge of her, determined to carry the lady off and make her his wife. That he succeeded in so doing is undisputed; but as to the *modus operandi*, historians are not very well agreed. The common, and certainly the most romantic version of the story is, that the lady was conveyed away one dark blustering December night in a baker's basket.

Her admirer, whom she married in 1594, was Lord President of Wales, and had necessarily to spend a great part of the year in that dominion; his lady appears to have disliked Wales, and very shortly after her marriage expressed her determination to live in Canonbury House. This being agreed to by her husband, she set to work to make arrangements for establishing as noble a household in the old building as any gay lady could possibly desire. The extent of the arrangements she contemplated may best be gathered from a letter written to her husband not very long after her marriage. After commencing with 'My sweet life,' followed up with a little 'soft sawder,' the lady makes the following modest proposals respecting herself

'I pray and beseech you to grant to me, your most kind and loving wife, the sum of L.2600 quarterly to be paid. Also, I would, besides that allowance, have L.600 quarterly to be paid, for the performance of charitable works; and those things I would not, neither will be accountable for. Also, I will have three horses for my own saddle, that none shall dare to lend or borrow; none lend but I, none borrow but you. Also, I would have two gentlewomen, lest one should be sick, or have some other let; also, believe it, it is an undecent thing for a gentlewoman to stand mumping alone, when God hath blessed their lord and lady with a great estate. Also, when I ride a-hunting or a-hawking, or travel from one house to another, I will have them attending; so, for either of these said women, I must and will have for either of them a horse. Also, I will have six or eight gentlemen; and I will have my two coaches, one lined with velvet to myself, with four very fair horses; and a coach for my women, lined with cloth, and laced with gold, otherwise with scarlet, and laced with silver, and four good horses; also, I will have two coachmen, one for my own coach, the other for my women. Also, at any time when I travel, I will be allowed not only carriages and spare horses for me and my women, but I will have such carriages as shall be fitting for all—orderly, not pestering my things with my women's, nor theirs with either chamber-maids', nor theirs with wash-maids'. Also, for laundresses, when I travel, I will have them sent away before with the carriages to see all safe; and the chamber-maids I will have go before, that the chamber may be ready, sweet, and clean. Also, for that it is undecent to crowd up myself with my gentleman-usher in my coach, I will have him to have a convenient horse, to attend me either in city or country; and I must have two footmen; and my desire is that you defray all the charges for me. And for myself, besides my yearly allowance, I would have twenty gowns of apparel, six of them excellent good ones; eight of them for the country, and six other of them very excellent good ones. Also, I would have to put in my purse L.2000 and L.200, and so you to pay my debts; also, I would have L.6000 to buy me jewels, and L.4000 to buy me a pearl-chain. . . . Also, I will have all my houses furnished, and my lodging-chambers to be suited with . . . silver warming-pans, cupboards of plate, fair hangings, and such like.'

We have no doubt the poor husband agreed to all this; and indeed he was not in a condition to dissent from any of his wife's proceedings, for his success in the acquisition of herself and her enormous wealth drove his lordship out of his wits, and he remained in a distracted state for several years.

And so the rich wife lived like a queen year after year in the grand old house, sought after by the great and noble for miles around. There were fair gardens then round the dwelling, and pleasant fields beyond; and in the warm summer days, many a stately dame in rustling silk, and courtly cavalier in richly embroidered doublet, sauntered about the dwelling, having resorted thither from the noise and ceremony of St James's. And then when winter set in, the 'velvet-lined' carriage, with its four fair horses, stood at the door; and with her long array of gentlemen, waiting-women, and maidens, the noble dame took her departure for her warm house in London, there to spend the winter.

For some reason, not very easy now to determine, the noble owners of the mansion appear gradually to have taken a dislike to their ancestral residence, and long before the reign of 'good Queen Anne,' the old tower, with the house by its side, had degenerated from a nobleman's residence into a mere lodging-house. A staircase, common to all the inmates, ran from the bottom of the edifice to the top, communicating with each floor, and the names of the lodgers were written upon small plates of tin affixed to

the doors of their respective apartments, much in the same fashion as they are at the present day affixed at colleges and inns of court. The lodgers in the house and tower were mostly literary men, who visited the pleasant village to enjoy, at little expense and near to the metropolis, the relaxation and delights of the country. Here Ephraim Chambers spent many a weary hour over the compilation of the ponderous folio dictionary which bears his name—the parent of the numerous Encyclopædia family, previously unknown. From hence Newbury launched forth those dearly loved little books which laid *Jack the Giant-killer* on the shelf, rooted up his bean-stalk, and made Cinderella tremble in her brittle slipper, and which were the treasures of the children of England for more than half a century. And last, but not least in our list, the weak-minded, amiable, lovable 'Goldy,' more than once made this tower his residence, and in it were brought to light some of those 'sweet children of his brain,' which will live as long as the English language itself has an existence.

Nor were more fashionable visitors to the tower wanting, for some enterprising person had discovered mineral water in the neighbourhood, good for half 'the ills which flesh is heir to;' and invalids of all descriptions, especially fair ones afflicted with that vague incomprehensible complaint, 'the vapours,' delighted in making this their summer resort, tripping down to the spring every morning in negligent attire, to take their accustomed quantum, and, doubtless, interfering sadly with the quiet labours of their literary neighbours.

Years rolled away, and as the lodgers at Canonbury saw the great city coming to visit them in their silent retreat, the fields around cut up for brick earth, and rows of goodly houses rising on every side, they found that they had lost all prospect of a continuance of the country quiet, which had been for so long a time the characteristic of their pleasant abode, and so they one by one left the old tower never to return; and before 1800, all the fame of Canonbury Tower as a pleasant lodging-house, had departed.

The old tower is nearly deserted now, and the building at its base has long since been converted into a dwelling-house. Hard by is established a goodly sized Ladies' Seminary; and part of the pleasant gardens of Canonbury House, where cowed monks walked with solemn pace for many a long year, and where high-born dames listened to tender tales from the eloquent lips of sighing cavaliers, is now a gravelled playground, where groups of pretty school-girls con their Magnall's Questions and Italian Grammars, all forgetful of the strange events that, in years gone by, took place in the neighbourhood around them.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XXXIX.—SCALING THE CLIFF.

O FOR a long interval of darkness!

Our hearts beat anxiously—at least I can answer for my own. Rube watched the guerrilleros, permitting his head to be seen by them. My eyes were bent upon the rocky wall, but through the thick darkness I looked in vain for our comrade. I listened to hear how he was progressing: I could distinguish a slight scratching against the cliff, each moment higher and farther away; but Garey climbed with a moccasined foot, and the noise was too faint to reach the ears of our enemies. O for a long interval of darkness!

It appeared a long one; perhaps it was not five minutes, but it *felt* twice that, before the lightning again blazed forth. With the flash, I ran my eyes up the precipitous wall. O God! Garey was still upon

its face, scarcely midway up. He was standing on a ledge—his body flattened against the rock—and with his arms extended horizontally, he presented the appearance of a man crucified upon the cliff! So long as the glare lasted, he remained in this attitude, motionless as the rock itself.

I turned with anxious look towards the guerrilleros. I heard no voice; I observed no movement. Thank Heaven! they saw him not!

Near where he was resting, some bushes of the trailing cedar grew out of the cliff; their dark foliage mottled its white face, rendering the form of the climber less conspicuous.

Another long spell of darkness, another blaze of light.

I scanned the gorge: no human form was visible. I saw a dark line that, like a crack, vertically intersected the cliff from parapet to base: it was the rope Garey had carried up. He had reached the summit in safety!

It was my turn next—for Rube insisted on retaining the post of danger—and with my rifle slung on my back, I stood ready. I had given the parting whisper to my brave steed, and pressed his velvet muzzle to my cheek. With the last flicker of the electric gleam, I seized the hanging lazo, and drew myself upward.

I had confidence in the rope: I knew it was fastened above, or safe in the strong grasp of Garey. With its aid, the ascent was rendered easy. I experienced no difficulty in climbing from ledge to ledge, and before the light came again, I had reached the crest of the cliff.

We lay flat among the bushes that grew by the very brink, scarcely shewing our faces to the front.

I saw that the rope had been fastened round the trunk of a small tree. Presently we perceived by its jerking that Rube had begun his ascent. Shortly after, we could hear him sprawling and scratching upward, and then his thin dark form loomed over the edge of the cliff, and dead beat for breath, he staggered silently into the bushes beside us. Even in the darkness, I noticed something peculiar in his appearance: his head looked smaller, but I had no time to question him.

We waited only for another glance at the guerrilleros; they were still at their posts, evidently unconscious of our movements. Rube's catskin cap, cunningly adjusted upon the boulder, satisfied them that we were still at ours; and explained, moreover, the oddness I had observed about the upper story of the trapper.

Rube had now recovered wind; and gathering up the rope, we stole away over the table-summit to search for a place of descent.

On reaching the opposite side, we at once found what we wanted—a tree near the edge of the cliff. Many small pines grew upon the escarpment; and selecting one, we knotted the rope securely around its trunk.

There was yet much to be done before any of us could attempt the descent. We knew that the cliff was more than a hundred feet in vertical height, and to glide down a rope of that length is a trying feat, worthy the most expert of tars. None of us might be able to accomplish it: the first could be lowered down easily enough, and this was our intention; so might the second; but the other would have to glide down the rope.

We were not long delayed by the contemplation of this obstacle: my comrades were men of quick thought; and a plan to lessen the difficulty soon suggested itself. Their knives were out in a trice: a sapling was procured, and cut into short pieces; these were notched,

and tied at intervals along the rope. Our 'Jacob's ladder' was ready.

It still remained to make sure that the rope was of sufficient length. The knots had somewhat shortened it; but this point was soon settled with like ingenuity. A small stone was tied to one end, and then dropped over the cliff. We listened: we heard the dull 'thump' of the stone upon the prairie turf. The rope therefore reached to the ground.

It was again drawn up, the stone taken out, and the noose fastened around the body of Rube, under his armpits. He was the lightest, and for this reason had been chosen to make the first descent, as he would least try the strength of the rope—still a doubtful point. The ascent had not proved it—for in climbing up, but one-half of our weight had been upon it, our feet resting either against the cliff, or upon its ledges. On reaching the plain, Rube was to submit the rope to trial, before either Garey or I should attempt to go down. This he was to do by adding a large stone to his own weight—making both at least equal to that of Garey, who was by far the heaviest of the party.

All being arranged, the old trapper slid silently over the edge of the cliff—Garey and I giving out the rope slowly, and with caution. Foot by foot, and yard by yard, it was drawn through our hands by the weight of the descending body, now lost to our sight over the brow of the cliff.

Still slowly, and with caution, we allowed the lazo to pass, taking care that it should glide gradually, so as not to jerk, and cause the body of our comrade to vibrate with too much violence against the rocks.

We were both seated close together, our faces turned to the plain. More than three-quarters of the rope had passed from us, and we were congratulating ourselves that the trial would soon be over, when, to our dismay, the strain ceased with a suddenness that caused both of us to recoil upon our backs! At the same instant, we heard the 'twang' of the snapping rope, followed by a sharp cry from below!

We sprang to our feet, and mechanically recommenced hauling upon the rope. The weight was no longer upon it; it was light as packthread, and returned to our hands without effort.

Desisting, we fronted to each other, but not for an explanation. Neither required it; neither uttered a word. The case was clear: the rope had broken; our comrade had been hurled to the earth!

With a simultaneous impulse, we dropped upon our knees; and, crawling forward to the brink of the precipice, looked over and downward. We could see nothing in the dark abyss that frowned below; and we waited till the light should break forth again.

We listened with ears keenly set. Was it a groan we heard? a cry of agony? No; its repetition told us what it was—the howl of the prairie-wolf. No human voice reached our ears. Alas, no! Even a cry of pain would have been welcome, since it would have told us our comrade still lived. But no, he was silent—dead—perhaps broken to atoms!

It was long ere the lightning gleamed again. Before it did, we heard voices. They came from the bottom of the cliff directly under us; but there were two, and neither was the voice of the trapper. It is easy to distinguish the full intonation of the Saxon from the shrill treble of the sons of Anahuac. The voices were those of our foes.

Presently the light discovered them to us. Two there were. They were on horseback, moving on the plain below, and close in to the cliff. We saw them distinctly, but we saw not what we had expected—the mangled body of our comrade! The gleam, long continued, had given us full time to scrutinise the ground. We could have distinguished upon it any object as large as a cat. Rube, living or dead, was certainly not there!

Had he fallen into the hands of the guerrilla? The two we saw carried lances, but no prisoner. It was not likely they had captured him; besides, we knew that Rube, unless badly crippled, would never have surrendered without a struggle, and neither shot nor about had been heard.

We were soon relieved from all uneasiness on this score. The brigands continued their conversation, and the light breeze wafted their voices upwards, so that we could distinguish part of what was said.

'Carrambo!' exclaimed one impatiently; 'you must have been mistaken? It was the coyoté you heard.'

'Capitan! I am confident it was a man's voice.'

'Then it must have proceeded from one of the *picaros* behind the rock. There is no one out here? But come! let us return by the other side of the mesa—*¡vamos!*'

The hoof-strokes admonished us that they were passing onward to carry out the design of the last speaker, who was no other than Ijurra himself.

It was a relief to know that our comrade had not yet fallen into their clutches. How far he was injured, we could not have an idea. The rope had given way close to the top, and Rube had carried most of it down with him. In the confusion, we had not noticed how much remained, *behind* our hands, when he fell; and now we could only guess. Seeing that he had disappeared from the spot, we were in high hope that he had sustained no serious injury.

But whither had he gone? Had he but *crawled* away, and was yet in the neighbourhood of the mesa? If so, they might light upon him. Hiding-place there was none, either by the base of the cliff or on the surrounding plain.

Garey and I were anxious about the result—the more so, that the guerrilleros had heard his cry, and were in search of him. He might easily be found in such a naked spot.

We hastily formed the determination to cross the table summit to the other side, and watch the movements of the two horsemen.

Guided by their voices, we once more knelt above them, at the rearmost angle of the mound. They had there halted to examine the ground, and only waited for the flash; we, too, waited above them, and *within* range.

'We kin fetch them out o' thar saddles?' whispered my companion.

I hesitated to give my assent; perhaps it was prudence that restrained me, for I had now conceived hopes of a surer deliverance.

At that moment gleamed the lightning; the dark horsemen loomed large under its yellow glare; they were less than fifty paces from the muzzles of our guns: we could have sighted them with sure aim; and, bayed as we had been, I was almost tempted to yield to the solicitations of my companion.

Just then, an object came under our eyes that caused both of us to draw back our half-levelled rifles—that object was the body of our comrade Rube. It was lying flat along the ground, the arms and legs stretched out to their full extent, and the face buried deep in the grass. From the elevation at which we viewed it, it appeared like the hide of a young buffalo spread out to dry, and pinned tightly to the turf. But we knew it was not that; we knew it was the body of a man dressed in brown buckskin—the body of the earlest trapper! It was not dead neither; no dead body could have placed itself in such an attitude, for it lay flattened along the turf like a gigantic newt.

The object of this attitude was evident to us, and our hearts beat with a painful anxiety while the light flickered around. The body was scarcely five hundred yards out; but though perfectly visible from our position, it must have been inconspicuous to the horsemen below; for as soon as it darkened, we heard them, to

our great relief, ride back toward the front, Ijurra reiterating his doubts as they passed away. Fortunate it was for both him and his companion they had not espied that prostrate form—fortunate for Rube—for all of us!

Garey and I kept our places, and waited for another flash. When it came, the brown buckskin was no longer in sight! Far off—nearly a mile off, we fancied we could distinguish the same form flattened out as before; but the gloam of the prairie-grass rendered our vision uncertain.

Of one thing, however, we were certain—our comrade had escaped.

CHAPTER XL.

A REINFORCEMENT.

For the first time, since encountering the guerrilla, I breathed freely, and felt confident we should get free. My comrade shared my belief; and it is needless to say that we recrossed the summit of the mesa with lighter hearts and step more buoyant.

Of course we no longer speculated about making the descent; with the fragment of rope left, that was impossible. We were simply returning to the front, to keep an eye upon the guerrilleros, and, if possible, prevent them from approaching our horses—should they by any chance discover that we had retreated from our position behind the rock.

We were the more anxious about our horses, now that we had less apprehension for ourselves; at least I can answer for myself, and the explanation is easy. So long as I felt the probability that every moment might be the last of my life, the fate of Moro and the white steed was but a secondary consideration. Now that I felt certain I should survive this perilous escapade, the future once more urged its claims; and I was anxious not only to preserve my own steed, but the beautiful creature that had led me into all this peril, but whose capture still promised its rich reward.

That all danger was past—that in a few hours we should be free, was the full belief both of my companion and myself. Perhaps you may not comprehend from what *data* we drew so confident and comfortable a conclusion, though our reasoning was simple enough. We knew that Rube would reach the rancheria, and return with a rescue—that was all.

'Tis true we were not without *some* anxiety. The rangers might no longer be there?—the army might have marched?—perhaps the picket was withdrawn? Rube himself might be intercepted, or slain?

The last hypothesis gave us least concern. We had full trust in the trapper's ability to penetrate to the American camp—to the enemy's, if necessary. We had just been favoured with a specimen of his skill. Whether the army had advanced or not, Rube would reach it before morning, if he should have to steal a horse upon the way. He would soon find the rangers; and, even without orders, Holingsworth would *lend* him a few—half-a-dozen of them would be enough. In the worst view of the case, there were stragglers enough about the camp—odd birds, that could easily be enlisted for such a duty. We had scarcely a doubt that our comrade would come back with a rescue.

As to the time, we were left to conjectures. It might be before morning's light—it might not be before late in the following day, or even the night after. But that was a consideration that now weighed lightly. We could hold our aerial fortress for a week—a month—ay, far longer, and against hundreds. We could not be assailed. With our rifles to guard the cliff, no storming-party could approach—no forlorn-hope could scale our battlements!

But what of thirst and hunger, you will ask? Ha! we dreaded not either. Fortune's favours had fallen upon us in showers. Even on that lone summit, we

found the means to assuage the one and satisfy the other!

In crossing the table-top, we stumbled upon huge *echinocacti*, that grew over the ground like ant-hills or gigantic bee-hives. They were the *mammillaria* of Quackenboss—dome-shaped, and some of them ten feet in diameter. Garey's knife was out in a trice; a portion of the spinous coat of the largest was stripped off, its top truncated, and a bowl scooped in the soft succulent mass. In another minute, we had assuaged our thirst from this vegetable fountain of the Desert.

With similar facility were we enabled to gratify the kindred appetite. As I had conjectured, on viewing them from the plain, the trees of light-green foliage were 'pifions'—the 'nut-pine' (*Pinus edulis*), of which there are several species in Northern Mexico, whose cones contain seeds edible and nutritious. A few handfuls of these we gathered, and hungered no more. They would have been better roasted, but at that moment we were contented to eat them raw.

No wonder, then, that with such a supply for the present, and such hopes for the future, we no longer dreaded the impotent fury of our foes.

We lay down at the top of the gorge to watch their further movements, and cover our horses from their attack. The flash of the lightning shewed them still on guard, just as we had left them. One of each file was mounted, while his companion, on foot, paced to and fro in the intervals of the cordon. Their measures were cunningly taken; they were evidently determined we should not steal past them in the darkness!

The lightning began to abate, and the intervals between the flashes became longer and longer.

During one of these intervals, we were startled by the sound of hoof-strokes at some distance off: it was the tramp of horses upon the hard plain. There is a difference between the hoof-stroke of a ridden horse and one that is riderless, and the prairie-man is rarely puzzled to distinguish them. My companion at once pronounced the horses to be 'mounted.'

The guerrilleros, on the alert, had heard them at the same time as we, and two of them now galloped out to reconnoitre. This we ascertained only by *hearing*, for we could not distinguish an object six feet from our faces—the darkness was almost palpable to the touch.

The sounds came from a considerable distance, but we could tell that the horsemen were advancing toward the mesa.

We drew no hope from this advent. Rube could not yet have even reached the rancheria. The newcomers were El Zorro and his companion on their return.

We were not kept long in doubt: the horsemen approached, and shouts and salutations were exchanged between them and the guerrilleros, while the horses of both parties neighed in response, as if they knew each other.

At this moment the lightning shone again, and to our surprise we perceived not only El Zorro, but a reinforcement of full thirty men! The trampling of many hoofs had half prepared us for this discovery.

It was not without feelings of alarm that we beheld this accession to the enemy's strength. Surely they would no longer hesitate to assail our fortress behind the rock? At least our horses would be captured? Besides, Rube's rescue might be too weak for such a force? There were nearly fifty.

Our anxiety as to the first two points was soon at an end. To our astonishment, we perceived that no assault was to be made as yet. We saw them increase the strength of their cordon of sentries, and make other dispositions to carry on the siege. Evidently they regarded us as hunters do the grizzly bear, the lion, or tiger—not to be attacked in our lair. They dreaded the havoc which they well knew would be made by our rifles and revolvers; and they determined

to reduce us by starvation. On no other principle could we account for the cowardly continence of their revenge.

CHAPTER XL.

THE INDIAN SPIRIT.

It was past the hour of midnight. The lightning, that for some time had appeared only at long intervals, now ceased altogether. Its fitful glare gave place to a softer, steadier light, for the moon had arisen, and was climbing up the eastern sky. Cumulus clouds still hung in the heavens, slowly floating across the canopy; but their masses were detached, and the azure firmament was visible through the spaces between. The beautiful planet Venus, and here and there a solitary star, twinkled in these blue voids, or gleamed through the filmy bordering of the clouds; but the chiefs of the constellations alone were visible. The moon's disc was clear and well defined, whiter from contrast with the dark cumuli; and her beam frosted the prairie till the grass looked hoar. There was neither mist nor mirage; the electric fluid had purged the atmosphere of its gases, and the air was cool, limpid, and bracing. Though the moon had passed the full, so brilliant was her beam, that an object could have been distinguished far off upon the plain, whose silvery level extended on all sides to the horizon. The thick black clouds, however, moving silently over the sky, occasioned long intervals of eclipse, during which the prairie, as before, was shrouded in sombre darkness.

Up to this time, Garey and I had remained by the head of the little gorge, through which we had ascended. The moon was behind us, for the guerrilla was on the western side of the mesa. The shadow of the mound was thrown far out upon the plain, and just beyond its well-defined edge was the line of sentinels, thickly posted. On our knees among the low shrubbery, we were unseen by them, while we commanded a perfect view of the whole troop, as they smoked, chattered, shouted, and sang—for they gave such tokens of their jovial humour.

After quietly watching them for some time, Garey left me to take a turn round the summit, and reconnoitre the opposite or eastern side. In that direction lay the rancheria; and if the picket was still stationed there, we might soon expect the rescue. My rangers were not the men to tarry, called forth on such a purpose; and, under Rube's guidance, they would be most likely to make their approach by the rear of the mound. Garey, therefore, went in that direction to make his reconnaissance.

He had not parted from me more than a minute, when a dark object out upon the plain attracted my glance. I fancied it was the figure of a man; it was prostrate and flattened against the ground, just as Old Rube had appeared when making his escape! Surely it was not he? I had but an indistinct view of it, for it was full six hundred yards from the mesa, and directly beyond the line of the guerrilleros. Just then a cloud crossing the moon's disc, shrouded the plain, and the dark object was no more visible.

I kept my eyes fixed on the spot, and waited for the returning light. When the cloud passed, the figure was no longer where I had first noticed it; but nearer to the horsemen I perceived the same object, and in the same attitude as before! It was now within less than two hundred yards of the Mexican line, but a bunch of tufted grass appeared to shelter it from the eyes of the guerrilleros, as none of them gave any sign that it was perceived by them. From my elevated position, the grass did not conceal it. I had a clear view of the figure, and was certain it was the body of a man, and, still more, of a *naked* man, for it glistened under the sheen of the moonlight, as only a naked body would have done.

Up to this time I had fancied, or rather *fared*, it

ight be Rube. I am feared—for I had no wish to see
 ube, upon his return, present himself in that fashion.
 arely he would not come back alone? And why
 ould he be thus playing the spy, since he already
 ew the exact position of our enemy?

The apparition puzzled me, and I was for a while in
 ybt. But the *naked* body reassured me. It could
 t be Rube. The skin was of a dark hue, but so was
 at of the old trapper. Though born white, the sun,
 rt, gunpowder, and grease, with the smoke of many
 prairie-fire, had altered Rube's complexion to the
 ne copper-tint; and in point of colour, he had but
 tle advantage over a full-blood Indian. But Rube
 ould not have been naked; he never doffed his buck-
 skins. Besides, the oily glitter of that body was not
 ube's; his 'hide' would not have shone so under
 the moonlight. No; the prostrate form was not his.

Another cloud cast new shadows; and while these
 ntinued, I saw no more of the skulking figure. As
 the moon again shone forth, I perceived that it was
 me from behind the tuft of grass. I scanned the
 round in the immediate neighbourhood. It was not
 to be seen; but on looking further out, I could just
 istinguish the figure of a man, bent forward and
 rapidly gliding away. I followed it with my eyes until
 it disappeared in the distance, as though it had melted
 into the moonlight.

While gazing over the distant plain in the direction
 whence the figure had retreated, I was startled at
 beholding, not one, but many forms dimly outlined
 upon the prairie edge.

'It was Rube,' thought I; 'and yonder are the
 rangers!'

I strained my eyes to their utmost. They were
 orsemen beyond a doubt; but, to my astonishment,
 instead of being close together, one followed another in
 single file, until a long line was traced against the sky
 like the links of a gigantic chain. Except in the
 arrow defile, or the forest-path, my rangers never
 ode in that fashion. It could not be they?

At this crisis, a new thought came into my mind.
 fore than once in my life had I witnessed a spectacle
 milar to that now under my eyes—more than once
 ad I looked upon it with dread. That serried line
 as an old acquaintance: it was a band of Indian
 rriors on their midnight march—upon the war-
 path!

The actions of the spy were explained: he was an
 ndian runner. The party to whom he belonged was
 bout to approach the mesa—perhaps with the design
 f encamping there—he had been sent forward to
 reconnoitre the ground.

What effect his tale would have, I could not guess.
 I could see that the horsemen were halted—perhaps
 waiting the return of their messenger. They were too
 distant to be seen by the Mexicans; and the minute
 after, they were also invisible to my eyes upon the
 darkly shadowed prairie.

Before communicating with Garey, I resolved to
 wait for another gleam of moonlight, so that I might
 have a more distinct story to tell.

CHAPTER XLII.

THE CABALLADA.

It was nearly a quarter of an hour before the cloud
 moved away; and then, to my surprise, I saw a clump
 of horses—not *horsemen*—upon the prairie, and scarcely
 half a mile distant from the mesa! Not one of them
 was mounted, and, to all appearance, it was a drove
 of wild-horses that had galloped up during the in-
 terval of darkness, and were now standing silent and
 motionless.

I strained my eyes upon the distant prairie, but the
 few horsemen were no longer to be seen. They must
 have ridden off beyond the range of vision?

I was 'about to seek my comrade and communicate
 to him what had passed, when, on rising to my feet, I
 found him standing by my side. He had been all
 around the summit without seeing aught, and had
 returned to satisfy himself that the guerrilla was still
 quiet.

'Hilloo!' he exclaimed, as his eyes fell upon the
caballada. 'What the darnation's yonder? A drove
 o' wild hosses? It's mighty strange them niggers
 don't notice 'em! By the eternal!'

I know not what Garey meant to have said. His
 words were drowned by the wild yell that broke
 simultaneously from the Mexican line; and the next
 moment the whole troop were seen springing to their
 saddles, and putting themselves in motion.

We of course supposed that they had just discovered
 the *caballada* of wild-horses, and it was that that was
 producing this sudden stampede. What was our aston-
 ishment on perceiving that we ourselves were the cause
 of the alarm; for the guerrilleros instead of fronting to
 the plain, rode closer up to the cliff, and screaming
 wildly, fired their carbines at us! Among the rest, we
 could distinguish the great gun of El Zorro, and the
 hiss of its leaden bullet, as it passed close to our ears!

We were puzzled at first to know how they had
 discovered us. A glance explained that the moon had
 risen higher in the heavens, and the shadow cast by
 the mound had been gradually foreshortened. While
 gazing out at the *caballada*, we had incautiously kept
 our feet, and our figures, magnified to gigantic pro-
 portions, were thrown forward upon the plain directly
 under the eyes of our enemies. They had but to look
 up to see us where we stood.

Instantly we knelt down among the bushes, clutching
 our rifles. The surprise occasioned by our appearance
 upon the cliff seemed to have deprived our enemies,
 for the moment, of their habitual prudence, as several
 of them rode boldly within range. Perhaps they
 were some of the late arrivals. In the dark shadow,
 we could not make out their forms; but one had the
 misfortune to be mounted on a white horse, and that
 guided the trapper's aim. I saw him glancing along
 his barrel, and heard the sharp crack, I fancied
 I heard a stifled groan from below, and the next
 moment the white horse was seen galloping out into
 the moonlight, but the rider was no longer upon his
 back.

Another cloud passed over the moon, and the plain
 was again shrouded from our sight. Garey was pro-
 ceeding to reload, when a cry arose amidst the darkness,
 that caused him to pause and listen. The cry was
 again repeated, and then uttered continuously with
 that wild intonation which can alone proceed from the
 throat of the savage. It was not the guerrilla that
 was uttering that cry; it was the yell of the Indian
 warrior.

'Comanche war-hoop!' cried Garey, after listening
 a moment. 'Comanche war-hoop! by the eternal!
 Hooraw! the Injuns are upon 'em!'

Amidst the cries, we could hear the rapid trampling
 of horses, and the ground appeared to vibrate under
 the quick heavy tread. Each moment the strokes
 sounded nearer. The savages were charging the
 guerrilla!

The moon shot forth from the cloud. There was no
 longer a doubt. The wild-horses were mounted; each
 carried an Indian naked to the waist, his painted
 body glaring red in the moonlight, and terrible to
 behold.

By this time the Mexicans had all mounted and
 faced towards the unexpected foe, but with evident
 signs of irresolution in their ranks. They would never
 stand the charge—no, never. So said Garey; and he
 was right.

The savages had advanced within less than a hun-
 dred paces of the Mexican line, when they were

observed to pull suddenly up. It was but a momentary halt—just time enough to enable them to mark the formation of their foes, and send a flight of arrows into their midst. That done, they dashed onward, uttering their wild yells, and brandishing their long spears.

The guerrilleros only waited to discharge their carbines and escopettes; they did not think of reloading. Most of them flung away their guns as soon as they had fired, and the retreat began. The whole troop turned its back upon the enemy, and spurring their horses to a gallop, came sweeping round the base of the mesa in headlong flight.

The Indians, uttering their demoniac yells, followed as fast. They were rendered more furious, that their hated foe was likely to escape them. The latter were indebted to us for having put them upon the alert. But for that circumstance, the Indians would have charged them while dismounted, and far different might have been their fate. Mounted and ready for flight, most of them would probably get clear.

The moment we saw the direction the chase was about to take, Garey and I rushed across the summit to that side. From the brow of the precipice, our view was perfect, and we could see both parties as they passed along its base directly below us. Both were riding in straggling clumps, and scarcely two hundred paces separated the rearmost of the pursued from the headmost of the pursuers. The latter still uttered their war-cry, while the former now rode in silence—their breath bound, and their voices hushed in the deathlike stillness of terror.

All at once a cry arose from the guerrilla—short, quick, and despairing—the voice of some new consternation; at the same moment, the whole troop were seen to pull up.

We looked for the cause of this extraordinary conduct; our eyes and ears both guided us to the explanation. From the opposite direction, and scarcely three hundred yards distant, appeared a band of horsemen coming up at a gallop. They were right in the moon's eye, and we could see glancing arms, and hear loud voices. The hoofs could be heard pounding the prairie, and my companion and I recognised the heavy tread of the American horse. Still more certain were we about that hoarse 'hurrah.' Neither Indian nor Mexican could have uttered that well-known shout.

'Hooraw!—the rangers!' cried Garey, as he echoed the cry at the full pitch of his voice.

The guerrilleros, stupified by surprise at sight of this new enemy, had paused for a moment—no doubt fancying it was another party of Indians. Their halt was of short duration; the dim light favoured them; rifles already played upon their ranks; and suddenly wheeling to the left, they struck out into the open plain.

The Indians, seeing them turn off, leaned into the diagonal line to intercept them; but the rangers, already close up, had just made a similar movement, and savage and Saxon were now obliquing towards each other!

The moon, that for some minutes had been yielding but a faint light, became suddenly eclipsed by a cloud, and the darkness was now greater than ever. Garey and I saw no more of the strife; but we heard the shock of the opposing bands; we heard the war-whoop of the savage mingling with the ranger's vengeful shout; we heard the 'crack, crack, crack' of yäger rifles, and the quick detonations of revolvers—the clashing of sabre-blades upon spear-shafts—the ring of breaking steel—the neighing of steeds—the victor's cry of triumph—and the deep anguished groan of the victim.

With anxious hearts, and nerves excited to their utmost, we stood upon the cliff, and listened to these sounds of dread import.

Not long did they last. The fierce struggle was soon over. When the moon gleamed forth again, the battle was ended. Prostrate forms, both of man and horse, were lying upon the plain.

Far to the south, a dark clump was seen disappearing over the prairie's edge: it was the cowardly guerrilla. To the west, horsemen galloped away, alone, or in straggling groups; but the cheer of triumph that reached us from the scene of strife told us who were the masters of the ground. The rangers had triumphed.

'Whur ur ye, Bill?' cried a voice from the bottom of the cliff, which both of us easily recognised.

'Hyar I be,' answered Garey.

'Wal, we've gin them Injuns goss, I reck'n; but cuss the luck, the yellor-bellies hev got clur off. Wagh!'

FOG-SEAS OF THE MOON.

ON the evening of the 2d of January in the present year, the erratic moon passed, while on her wanderings, between the earth and the planet Jupiter. The planet was wide awake, sparkling with brilliancy at the time; but the movements of Cynthia were so brisk, that he found himself excluded from the benefit of earth-shine before he could turn himself round. In ninety short seconds, his pleasant face was entirely hidden from the friendly observers who were watching it from their stations upon the terrestrial sphere.

Although, upon this occasion, the grave and majestic Olympian star was caught at disadvantage by the nimble luminary of the silver horns, he did not lose his ordinary self-possession; his placid temperament proved to be fully equal to the emergency. Having remained quietly in concealment for about sixty minutes, he glided calmly out from behind the screen which had been interposed between him and his terrestrial friends, and as he did so, adroitly turned the tables upon the moon, by giving a sly hint or two concerning certain secrets which it was her intention to have held in reserve from her curious neighbours here below. The readers of *Chambers's Journal*, trained as they have been to like the bonbons of science, will be glad to hear how the astute Jovian star contrived to retaliate upon the sprightly night-queen, by throwing light upon her obscurities, in return for the temporary obscuration he suffered at her horns.

During the recent occultation of the planet Jupiter, one-half of the civilised territory of the earth was fairly bristling with telescopes turned towards the edge of the moon. An occultation of any of the larger planets is always an occurrence of surpassing interest to astronomers, because the clear, well-defined images which they present in good telescopes, are pictures of such exquisite delicacy, that they afford a very severe test of the condition of the lunar surface as to the presence or absence of gaseous or vaporous investment, when that surface is seen in front of the picture in the act of sweeping before it; the smallest amount of vapour or gas would perceptibly dim and distort the delicately sketched light image contemplated under such circumstances. When it is Jupiter that undergoes occultation, there is also additional interest, because this planet is waited upon by four satellites of considerable brilliancy, which have to pass in succession behind, and out from, the border of the moon; so that there are, as it were, five occultations in one to be observed.

During the recent occultation of Jupiter, a large number of excellent observations were recorded. From

among the trustworthy observers, Messrs W. R. Grove, Dawes, Hartnup, and J. Watson, Dr Mann and Lord Wrottesley agreed in the positive statement that there was no perceptible alteration of the planet's figure, or distortion of outline, while the planetary image was in apparent contact with the moon, and under good optical definition. Mr William Simms and Mr Lassell, on the other hand, described the curved outline of the planet as appearing to be flattened, or bent outwards towards the moon's limb. Mr Lassell's observation, however, affords a suggestion for the ready explanation of this discrepancy. This gentleman noted distortion as the planet went behind the moon, but distinctly states that there was none as it came out from concealment; and further remarks, that the *air was very unsettled*, and vision very unsteady at the commencement, but the definition much more even and satisfactory at the conclusion of the occultation. Mr William Simms also says that the atmosphere at Carshalton, where his observation was made, was very unsteady. In all probability, the distortion of the planet's figure, noticed by these observers, was due to the *unfavourable state of the earth's own atmosphere* at their stations, causing the image of the planet to tremble and undulate while under inspection.

Mr Hartnup and Dr Mann noticed that the line-like segment of the planet's disc was broken up into three or four beads of light, just before it finally disappeared behind the moon. This result was due to small projections of the moon's border then crossing the streak of light in some places, while portions of the streak were still visible at indentations of the lunar edge in others. Mr Hartnup saw the third satellite of the planet *shining in the midst of a large indentation* of this kind for a second or two, and looking as if within the circumference of the lunar face. Professor Challis, employing the great Northumberland refractor at Cambridge, noticed that the moon's dark limb, as it swept in front of the bright planetary surface, was distinctly jagged and zigzagged by valleys and mountain-peaks.

As the planet slipped out from behind the *bright side* of the half-illuminated six-day-old moon, the different characters of the planetary and lunar light were strikingly apparent. The planet's face was about as pale again as the moon's, and seemed to most of the observers watching it to wear, as compared with the moon's aspect, a soft greenish hue. Mr Lassell was of opinion that the planetary faintness was mainly the result of the relatively large brilliant surface the moon presented in such close proximity; he believed that there would not have seemed anything like so marked a difference of intensity, if the planet had been contemplated in contact with a piece of the moon, having dimensions not larger than itself.

But the most interesting fact yet remains to be told. The bright border of the moon at this time crossed the soft green face of the planet, not with a clear sharply cut outline like that which had been presented as the disc passed into concealment; it was fringed by a streak or band of graduated shadow, commencing at the moon's edge as a deep-black line, and being then stippled off outwardly until it dissolved away in the green light of the planet's face. This shade-band was about a tenth part of the planet's disc broad, and of equal breadth from end to end. Mr Lassell described it as offering to his practised eye precisely the same appearance that the obscure ring of Saturn presents to a higher magnifying power, where that appendage crosses in front of the body of the Saturnian sphere.

There could be no mistake concerning the actual existence of this curious and unexpected apparition. It was independently noticed and described by at least six trustworthy observers, and the descriptions of it

given by each of these corresponded with the minutest accuracy. The shadow was seen and described by Mr Lassell, at Liverpool; by the Rev. Professor Challis, at the observatory of Cambridge; by the Rev. W. R. Dawes, at Wateringbury; by Dr Mann and Captain Swinburne, R.N., at Ventnor; and by Mr William Simms, at Carshalton. It therefore only needs that the unusual presence should be accounted for: the handwriting being there, the question remains to be answered: 'Can its interpretation be found?' Can science read the meaning of this shadow-fringe inscription? Are there minds that can fathom, as well as eyes that could catch, this signal-hint thrown out by Jupiter at the instant of its emergence from its forced concealment behind the moon?

It was Mr Dawes's impression on the instant, that the mysterious shadow was simply an optical spectrum—a deep-blue fringe to the light maze caused by the object-glass of his telescope having been accidentally over-corrected for one of the irregularities incident to chromatic refraction. This notion, of course, became altogether untenable so soon as it was known that the same appearance had been noted by other telescopes, in which the same incidental imperfection had no place. All felt that the shadow could not be referred to a regular atmospheric investment of the moon's solid sphere, because under such circumstances the streak should have been always seen when the rim of the moon rested in a similar way across a planetary disc. The sagacious Plinian professor of astronomy at Cambridge, Professor Challis, seems to have been the first to hit upon the true interpretation of the riddle. This indefatigable star-seer has long suspected that the broad dark patches of the lunar surface—the *seas* of the old selenographers—are really shallow basins filled by a sediment of vapour which has settled down into those depressions; in other words, he conceives that there are *fog-seas*, although there are no *water-seas*, in the moon. The general surface and higher projections of the lunar spheroid are altogether uncovered and bare; but vapours and mists have rolled down into the lower regions in sufficient quantity to fill up their basin-like hollows, exactly as water has gravitated into the beds of the terrestrial oceans. The professor, using the high powers of the magnificent telescope furnished to the Cambridge Observatory by the munificence of the late Duke of Northumberland, was able to satisfy himself that the planet actually did come out from behind a widely gaping hollow of the moon's surface—at the bottom of a lunar fog-sea, *seen edgewise*, so to speak. If a shallow basin extended for some distance round the curvature of the lunar spheroid, and if it were filled up with vapour, that vapour would rest at a fixed level, exactly after the manner of a collection of liquid, and such fixed level would be concentric with the general spheroidal curvature of the satellite. Under such an arrangement, there would therefore necessarily be a bulging protuberance of the vapour-surface, through which a remote luminary might be seen, when it rested in the requisite position. This, then, is Professor Challis's understanding of Jupiter's hint. The moon has *fog-seas* upon her surface, and the band of shadow visible upon the face of Jupiter as the planet came out from behind the earth's satellite, was a thin upper slice of one of those fog-seas seen by the favourable accident of the planet's light shining for the instant from beyond. Destiny was, upon this occasion, propitious to the phalanx of terrestrial observers standing so resolutely and patiently to their telescopes, and brought the planet, which had gone into occultation at a spot where there was high and rough ground, out at a point where the moon's limb was smooth, and depressed below the general level. It is, of course, only when occulted luminaries pass behind such depressed localities, that these shade-

bands ought to present themselves, if Professor Challis's shrewd interpretation be a reading of the truth.

THREE CHAPTERS OUT OF MY LIFE.

CHAPTER III.

ASCENT is hard—descent only too easy; in accordance with this truth, our descent of the Dachugschur did not take one-third of the time we had spent in climbing it. Altogether, we were about sixteen hours passing over the mountain; and what with encountering swarms of mosquitoes, wasps, and gadflies during the whole time, we, together with our horses and reindeer, were so thoroughly worn out, that we could not proceed a step. For this reason, we halted as soon as we had reached the foot of the mountain, and looked about for a spot where we might encamp for the night. After unloading the horses, we kindled a fire to drive away the insects, and made tea: just as we were drinking the second cup, my dog, which was loose, came running from the forest, whining and barking that we might understand there was a wild beast somewhere in the neighbourhood. I know not what became of the weariness we had felt until then, or of the heat from which we suffered, or of the hunger and thirst not yet appeased. I took my gun, looked to the priming, saw that the flint was right, seized a knife, and ran off after the dog; my young Cossack and one of the Yakut guides following me. The dog led us a second time to the top of the Dachugschur: when we had reached it, we saw a mass of stone forming a level table, which jutted out half-way up the side of a perpendicular rock; on this stood an animal called a wild-sheep. There were trees some distance apart, up the side of the rock; so by means of them we swung ourselves down from branch to branch, till we were within 600 yards of it, then we all three fired at it together. Had the wild-sheep been killed on the spot where it stood, one of us, with a long staff and a rope in his hand, would have been let down, hunter fashion, by means of another rope, to the projecting rock beneath: there he would have fastened one end of his cord round the horns of the sheep; the other he would have held in his teeth whilst we drew him up again. In the same manner, we should have dragged up the sheep; at least so we intended; but the animal, when hit, rolled on its side, and so slipped over the edge of the rock, falling down a precipice beneath, of which we could scarcely see the bottom; and the noise that its horns made striking the stones as it fell, raised a loud echo amidst the mountain. It was dashed from stone to stone, and scarcely a morsel of the body remained whole by the time it had reached the bottom. Returning to the place where we had halted for the night, I saw a new kind of sport. My dog frightened some nine or ten birds that were on the ground; they flew up, and perched on the low boughs of a young birch. Quick as thought, snap went the lock of my gun; just as I was pulling the trigger, the Yakut guide caught my arm, saying: 'You may spare your powder and shot, for we shall catch these birds with our hands.'

No sooner had he said this than he pulled out his knife and cut a long switch, breaking off all the twigs; then he fastened a hair-noose to the end of it, and went gently up to a bird, holding the noose up before it. The bird stretched out its neck to see what manner of thing this might be; thereupon the guide slipped the noose over its head, and pulled it off the tree. After he had thus taken it and wrung its neck, he did the same to another; and so, one by one, to all; catching them every one with the same noose.

The name of this bird in Yakutisch is karäky. It is larger than the hazel-hen (*Tetrao bonasia*), and smaller than the spotted black-cock, though the

plumage is like that of the latter. In form it is thick, with a short neck; the flavour is like that of black-cock. I have never seen it anywhere except on the way to Udscoi, and even there it is very seldom found. I suppose that predatory birds and four-footed animals, knowing its simple nature, easily make it their prey, and thus it is nearly exterminated.

Every night after we had descended the Dachugschur, and until we reached Udscoi, as soon as we had chosen our quarters, we would go to some bay or inlet of the river, and throw out three hair fishing-nets, which we had brought with us for that purpose. In the morning, perhaps, we found two or three fishes in them, of the kind called charius (*Salmo thymallus*). These were most acceptable, for, without them, we should have had nothing to eat but coarse barley-meal and rancid butter.

In this manner we journeyed on until the middle of summer, by which time we had reached Udscoi. Udscoi stands on the left shore of a river of the name of Ud, and is built in a tolerably large valley lying between the mountains. It is distant about nine kōs from the Sea of Okhotsk. The inhabitants are as follows—a Russian clergyman, a clerk, a Cossack captain over about fifty men, three or four Yakuts, and from three to four hundred Tunguses. Not one of these last has a house or any settled place of abode: they all wander about, summer and winter, following the chase.

As I had been commanded to make myself acquainted with the habits and the mode of hunting pursued by these people, it was necessary that I should inspect the whole country. For this purpose, after resting a while at Udscoi, I set off in a boat with two Cossacks and two guides, for the mouth of the river Ud, which flows into the sea.

Two or three Yurte-Tunguses dwell at the mouth of the Ud; they catch a great many fishes called kütä (a kind of salmon-trout) and seals, and get a great store of train-oil from the whales, of which every year they are sure to kill two or three from thirty-five to forty feet long. These whales are washed up into the mouth of the Ud.

They kill the large seals by shooting them through the head; small ones which are left high and dry by the ebb of the tide, they destroy by blows with a club. Thongs and straps are cut from the seal-skins; that which remains is hung in the smoke to dry, and then made into soles for shoes. The strength and durability of this skin is greater than that of any other animal.

There is great abundance of ducks and geese, and an enormous number of different kinds of sea-fowl. They come flying inland at high-water, and not finding room enough on the small islands, all huddle down one upon the other. I have sometimes killed a score of them at a single shot when they have been flying up again.

I remained four days at the mouth of the Ud, and then returned to Udscoi, taking with me six men. We travelled in two boats which we had hollowed out of poplars. The first day, on account of the violence of the stream, we had to make our way up the river by the help of poles tipped with iron. Rain fell in the evening and during the whole night, so that on the morning of the second day the river overflowed its banks, and extended on either side to the thick woods on the shore. In that neighbourhood the rain falls, at this season, day and night for fifteen or sixteen days; so that if we had tarried on that account, we should have been delayed so long that provisions and strength would have failed us. We therefore resolved to spare no labour in getting on as quickly as possible, and for five days keeping close inshore, we pulled ourselves onwards from tree to tree. At the end of that time, our provisions were gone, our strength was exhausted,

and we were at a distance of three kōs by water, and one and a half by land from Udsokoi.

Our guide assured me that if we went by land, the three or four brooks we should have to cross would prove no great hindrance to our journey through the forest; therefore I got up the next morning at sunrise, took a gun and a hatchet, and set off on foot with a Cossack and the guide, determining to reach Udsokoi that night, and send back provisions to those who were left in the boat. But we were not able to fulfil our intention; for when we had gone about half a kōs from the boat, we came to the first brook, which, rising at some little distance, had flooded the forest with its waters. Whilst we went round in order to cross it at the spring, wading waist-deep in water, we lost half of the day. In the evening, at sunset, we came to a second stream, many kōs in length, which it was impossible to cross in the same manner; so we were obliged to pass the night there in the rain, without any kind of covering. We sent off the guide alone, in a *prahm* we constructed able to hold one person, in order that when he had reached Udsokoi, he might send off a man with a boat to us. At sunset, to our joy, we saw two men approaching with boats. We crossed with them, and reached Udsokoi about midnight, with not a dry thread in our clothes, and having tasted no food for two days. In this way we had travelled in our wet clothes for seven days, and yet not one of us took any harm.

Our second journey from Udsokoi was attended with even more difficulties than this first. It was in the month of September; the nights were beginning to get cold, and all the water of no great depth was frozen. I had gone by water with my Cossack and three guides to a place about ten kōs distant, where an assembly of the Tungouses was to be held, and some dispute settled. I posted back from this place to Udsokoi with reindeer, and the first fall of snow came down on the spot where we halted at night.

When the guides got up the next morning, they could find only one out of our ten reindeer; a wolf had made its appearance in the night, and they were all scattered hither and thither. The three guides set out to find them, but I remained behind with my Cossack. Three days passed, and not one of the guides returned; in the meantime, rain and snow fell without ceasing. We had taken provisions for only six or seven days, and they were almost entirely consumed. The place where we had stopped was covered with water; in a word, our stay there was an intolerable hardship. On the fourth day, the guides returned with six reindeer, which they had had great difficulty in finding; they could not discover any traces of the remainder. Immediately on their arrival, we set to work to thaw our tent, which was covered three fingers thick with ice and snow: this we accomplished with great trouble, and then continued our journey on the same day. On the second day, we reached the border fortress.

After about ten days' preparation, I started on my long journey, taking with me two Cossacks, two guides, and about thirty reindeer. This was the end of September, when all the water is frozen, and the snow falls in great masses.

We travelled south-east to Borukan, distant about fifty kōs from Udsokoi. It is about four kōs from the sea, and three or four days' journey from the mouth of the river Amur, which falls into the sea. From Borukan to the source of the Byraja, is about fifty kōs; the Byraja is about thirty kōs distant from the river Silimdashli; and it is some sixty kōs from the Silimdashli to Udsokoi.

On the first day, we dismounted from our reindeer at a place where we intended halting for the night, having travelled about two kōs. We immediately released the reindeer, and turned them loose, binding a piece of wood as thick as a man's arm, and four or

five feet long, across the necks of those that were not quite tame; so that if on the following morning, when the guides went to catch them, they should run away, this wood knocking against their knees would prevent them from going far.

Next, one of the guides with a long piece of wood pierced the snow until he came to the bottom and found hard ground; then I and my two Cossacks, with the help of shovels which we had brought with us, cleared away the snow. One of the guides split wood into small pieces, to make a fire; and another cut off about thirty boughs, stripped them of the small branches, and dragged them to the place where we had cleared away the snow. Three of these poles were then tied together at one end; the other ends were stuck into the ground far apart, and the remaining poles were placed round these; the whole being thickly covered with reindeer skins, sewn together, so that there was only one small aperture for the smoke to pass through. This cone-shaped *yurte* was then covered with snow, a small opening being left on one side of it, through which, with some trouble and by stooping, you could crawl in and out. We next collected a number of small twigs, spread them thickly inside the *yurte*, and covered them with heaps of skins rolled tightly together. In the middle of the *yurte* we made a fire of split wood, and melted the snow with which we had filled the pot and the tea-kettle.

By the time we had melted the snow, cooked and eaten our tea and supper, and were undressed and asleep, it was midnight. The fire we had kindled, and the burning of the loose soil, produced such thick impenetrable smoke, that it made our eyes smart, so that we could not see, and rendered the interior of the *yurte* quite invisible.

We were awake and up before dawn, digging our clothes out of the snow in which they had been buried to draw out the damp. As soon as we were dressed, we had tea. When it was quite light, the guides took their ropes, and went to catch the reindeer. The manner of doing this is as follows: You take a thin rope about twenty fathoms long, and wind it round your right hand until it is about the size of the small cup out of which the Russians drink tea; both ends of the rope you hold in your left hand, and from a distance of about ten fathoms, you throw the ball over the horns of the reindeer: unless you miss your aim, it darts over them as swift as an arrow, so that it whistles as it cuts the air. As soon as the reindeer feels the rope, it stands quite still; you then pass another rope round its head, and proceed to take its companions in the same manner.

As soon as the reindeer were caught and assembled, we put the packsaddles upon them, and loaded them, so that they were ready to start by sunrise. We had previously stripped the *yurte* of the sewn skins that covered it, and rolled them up, and had packed away the cooking utensils and the cups used on the previous night. We travelled in this manner for seven months, during the whole winter, never sleeping in a warm house for a single night. We halted at three stations, each time for about two days, and we there met some ten *Yurte-Tungouses*.

This broad expanse of about 200 kōs consists of thick woods, rocks, and streams; but you meet with no roads. The Tungouse guides know every river, and every brook even, by name, and they reach the place to which they are going without any difficulty, and without once losing themselves. In many places, the snow falls a full fathom deep; this they break through in their snow-shoes, and lead the unladen reindeer. You have to make your way on foot through a thick impenetrable underwood, which sometimes extends for three or four versts, cutting out a path with your knife. In difficult places like these, it is impossible to traverse more than a kōs a day.

In the middle of winter, we came to the lofty mountain of Byraja. We passed one night at the foot of it; and having laid aside our upper garments for the pull, we reached the heights only as the evening twilight of the following day was ending. Here we met with innumerable difficulties: we had to shovel away the deep snow—frozen hard on the surface—and right before us rose a perpendicular rock. When one man, with immense exertion, had climbed to the top of it, he drew up one of the guides with a rope; all the baggage was then taken off the reindeer, and drawn up separately by ropes, and the reindeer were drawn to the summit. After this, we ourselves ascended by the help of ropes.

The hardship of such a day will never be forgotten. Poor and insufficient food, wind that one could not face, and intolerable cold—all these had oppressed, and now assailed me. In appearance, I did not differ from one of the Tungouses. Wind and the cold in the daytime, and the smoke and heat of the fire at night, had dyed my face a deep yellow; my hair and the shape of my nose were the only signs that remained of my being a civilised Russian.

In climbing the mountain, I had been much heated; so, for want of water, I ate some snow, and this struck the cold into me. Scarcely had we reached our halting-place for the night, when I became very ill. The blood rushed to my head, and my face burned like fire. There was no physician near; and lying there in winter, on the top of a high mountain, in a biting wind, my case was dangerous.

I shall not now speak of the struggle between life and death, nor of the care of my Cossacks and the guides, who pitied me with their whole hearts, watched by me and attended on me, taking care, above all, that the covering should not be thrown off, and the cold reach me, which would have been certain death. In the morning, I fell asleep; at mid-day, when I awoke, I found myself covered with perspiration, as if I had just come out of the water. In the evening, nothing remained of my illness except a headache. Nature had cured me better than any physician. The following morning we continued our journey. At the end of seven months, I had accomplished my business, and returned to Udscoi.

The country through which I travelled is characterised by its impassable roads, fearful forests, insurmountable mountains, and numberless streams. It abounds in animals; namely, the panther, bear, wolf, glutton, lynx, black and red fox, sable, squirrel, hare, otter, elk, wild reindeer, roe, fallow-deer, wild-sheep, musk, wild-boar, ermine, flying squirrel, bats, and all kinds of mice. Then of birds, there are the white stork, swan, duck, goose, crane, black-cock, the hazelhen or gelinotte, the white grouse or ptarmigan, the Russian black duck, the karäky, and the snipe.

I remained in Udscoi for a fortnight, and completed the imperial commission with which I had been intrusted; then, in the month of April, I started for Ykutsk. Travelling at this time of the year is most dangerous. The hungry bear rushes blindly upon the first creature that crosses his path. In April, the ice in the rivers breaks up; at the same time, water pours down from the mountains, and not only broad rivers, but tiny streams which one might have stepped across, overflow their banks, and go foaming and boiling among the thick woods. As you wade through one of these brooks, the water, which at other times barely reaches the body of the reindeer, washes, by the force of the torrent, quite over the saddle.

One day, as I was riding across a river, my reindeer stumbled against a great round stone under water, and fell. In an instant, the water was foaming over my shoulders, and if I had not supported myself with a stick that I had in my hand, and held fast to the saddle, I should have fallen, and the stream would

have carried me away. Had this been the case, no human power, nor speed, nor understanding, could have rescued me. In some places, we had to stand upon the black banks, which are the height of a man, and to push the reindeer, one and all, into the rivers beneath. Whilst they were standing breast-high in water, we dropped down adroitly into the saddles, and so rode over. In this manner, we had to cross about ten streams in the course of a day. At night, you cannot find any place for halting, because the water from the mountains has turned the dry ground into knee-deep mud.

It is of no use to think of building a yurt, or pitching a tent and kindling a fire; so, without even taking the trouble to look for a dry place, you cut two thick boughs, and throw them down; then you spread some young larches over them, and on the top of these you pile all the baggage. The young larch-trees have also to serve for a bed. To kindle a fire in such places, and to make tea and cook food, is a matter requiring great skill, nevertheless necessity compels one to do it.

Thus I journeyed on, till I again reached the banks of the Utchur. After remaining there fourteen or fifteen months, until my business was completed, I returned to Yakutsk, where I arrived at midsummer, having struggled with unheard-of difficulties for a year and a half.

And here the Third Chapter out of my Life must close.

LOVE.

Oh! would I had the wealth of worlds,
The monarch's crown of gold—
And all the gems in secret caves
This wondrous earth doth hold—
The countless pearls that gleam unknown
Beneath the deep blue sea—
Oh! would I had such wealth, that I
Might scorn it all, for thee.

Oh! would I were, in courtly halls,
The bright and shining star—
The glitt'ring magnet, for a world
To gaze on from afar—
That I might scorn the kingly throng,
The world, on bended knee—
All for a simple cottage home,
With nought but love, and thee.

I care not for the golden wealth,
Nor sigh in courts to shine—
I only care, I only sigh
To know thy heart is mine.
Far more to me, than gem, or gold,
Or jewel of the sea,
Would be that simple cottage home,
With nought but love, and thee. V.

TYPE OF A BURMESE VILLAGE.

Select an easy, rolling slope, with knolls and tangled thickets, gently declining from a range of heavily timbered hills. Flank it on either side with interminable jungle, affording secure cover for the various forest-life. In front of all, train a wide, rapid, darkly discoloured stream, abundantly stocked with alligators, water-oxen, and other such fishy game; and fill up your background with teak-forests and remote mountains, with here and there some paddy-fields between, which shall pasture your wild elephants. Cover your ground with creepers, cactuses, canes, and various tropical vegetation in a wilderness of profusion. In among these, plant your native bamboo huts as thickly as you can, and with picturesque freedom of arrangement.—*The Golden Dragon.*

PRICE 1½d.

FRIENDS AND ACQUAINTANCES.

It is said that in former times the dons at Cambridge were singularly punctilious in requiring the ceremony of introduction before they would permit the slightest intercourse between themselves and anybody else. Amongst the many *faciæ* of the university, there is a story current on this subject. A fellow of Trinity was one day walking by the Cam in stormy weather, when he saw a man in the water struggling for his life. The fellow was an excellent swimmer, and his first impulse naturally was to jump in to the rescue. He had one foot already in the air, when he suddenly recollected that the drowning man was an utter stranger. On this he paused, and cried out in an agony of distress: 'What a pity that I never was introduced to that man!'

There are some characteristics essentially British in reference to this same talismanic influence of introduction. You sit by a man at a theatre, or any other public place; you guard jealously against any infringement of your rights on his part, though he may be a Falstaff, and you could creep into an alderman's thumb-ring; you bristle up if he dares to touch upon the space for which you have legally and honestly paid; you look daggers at him if he ventures a whisper in the midst of an interesting scene, and are ready for an open remonstrance if he hums the airs to himself, or beats the devil's tattoo upon the floor. All at once enters a mutual acquaintance, who pronounces but four words—Mr Smith, Mr Jones; Mr Jones, Mr Smith. No abracadabra in the vocabulary could produce a more magical transfiguration. You are seized instantly with a profound desire to administer to all the little comforts which the larger bulk of your fat neighbour requires: you tuck in your coat-tails; you put your neighbour on the other side out of patience by shifting your legs out of the way of your new friend; you listen with patience to all kinds of absurd remarks which he may choose to utter in the very midst of the *dénouement* of the piece; you are willing to assist him in catching the air of the comic song, and would lend him your back to beat his tattoo upon. And all this because a man who, a week ago, may have been to you as entire a stranger as himself, has simply uttered his name before you.

Something of the same kind may be found in a nation of which many of the characteristics are the same as our own—the Dutch. A burgher of the famous suburb of Amsterdam—where, it is said, they sweep out every morning the bed of the canal with a hearth-broom—was once quietly smoking in the back-parlour of his residence, when a rap, much louder than ordinary,

was heard at the door, and an officer entered in the Austrian imperial livery. The new-comer announced that the Emperor Joseph II. was on his way to visit the renowned retreat of the Holland merchants, and as the mansion of mynheer was amongst the most celebrated as a marvel of comfort and cleanliness, he intended to honour its master with a call.

'He will of course bring with him a proper introduction,' observed the burgher.

'It is his imperial majesty the Emperor Joseph II.,' replied the messenger—'the first potentate in Europe; and he is not likely to suppose anything further will be required of him than to announce himself.'

'I know nothing of your emperor,' replied the Dutchman; 'he does not belong to my acquaintance; and if he were even the burgomaster of Amsterdam in person, I would not admit him without a proper presentation.' The Hollander then resumed his pipe, and the emperor was forced to return without a more intimate acquaintance with a Dutch merchant's villa than mere hearsay.

The nations of Latin race know nothing of all this. You may notice an Italian in a public conveyance—on the one side of him is an intimate acquaintance, on the other an utter stranger; and yet he will carry on conversation with both for an hour without your being able to pronounce which is the acquaintance and which the stranger. Since the time-honoured custom of kissing amongst southern nations is gone somewhat out of fashion, there is no outward and visible sign by which any man in those countries evinces that the man he meets is a friend or otherwise. He takes off his hat to the person of whom he asks the way to his hotel; he takes off his hat to his own brother. He is profuse in his expressions of regard to a man whose name he certainly does not know how to spell; and perhaps the chief distinction between his address to the said man and to one of his own relatives is, that it would be warmer and more demonstrative to the former than to the latter. Let any one demand the price of a piece of salmon from a French fishwoman whom he sees for the first time. It is ten to one that when she names the price, she will add: 'For you, monsieur.' This 'pour vous' is one of the commonest phrases in every French mouth. It is naturally applied in cases of long acquaintance; and though not so naturally, yet often with more truth applied to a fresh acquaintance; for the southerner, who admires novelty as he admires every other excitement, will do more for a new-comer than for an old friend.

There is no doubt that all this increases the pleasure of visiting the cities of the south, and has a wonderful effect on first impressions. The cause has

been assigned, in the first place, to the natural temperament of the inhabitants of Southern Europe; and, secondly, to their habit of passing so much of their time in public gardens, cafés, and other places where they are constantly apt to encounter strangers. We do not believe either of these to be the principal cause, and we demur to the first altogether. It is extremely common among foreigners to hear people talk of the English temperament as if it were a thing fixed and undeviating. Now, we will answer for it, that out of twenty Englishmen taken at random, you will find every extreme of temperament—the most passionate with the most calm, the most frank with the most reserved, the most careless and sociable with the most nervous and retiring. The great success of our countrymen all over the world is in great part owing to the diversity of temperament, whereby the proper man is, sooner or later, sure to be forthcoming for every exigency. The fact may be owing to our descent from so great a variety of races. Assuming it to be a truth, we altogether deny that any national characteristics of our own country, in respect of manners, are due to temperament. It may in truth be asserted, that the nation which possesses the greatest variety of temperament, presents at the same time the most uniform and decided system of manners.

The principal cause of the difference of the bearing towards strangers in our own country, and in those of Southern Europe, is the different meaning we attach to an acquaintance. An acquaintance in France or Italy means a man whose name you know, and to whom you speak when you meet him. The chances of getting further than this are so remote, that they have no more influence on the proceeding than the idea with an Englishman that a new friend may one day turn out a son-in-law. In England, on the contrary, when a man makes an acquaintance, the idea of its ripening into something like friendship is generally present to his view. In France, however small may be a man's income, he invariably counts among his expenses a given sum for pleasure; just as we should for any ordinary necessary of life. He would stare if you were to hint that he might leave out this item upon an emergency. But, even where the fortune is large, a Frenchman, when he takes an apartment, rarely dreams of having a spare room attached to it. Here, on the contrary, a man seldom reckons pleasure amongst the absolute necessities of his expenditure; but then, when he takes a house, he likes to have a spare bed in it. Then the lurking idea in the mind of the one is to spend his time of recreation with acquaintances, and in that of the other, with friends.

There are other reproaches besides that of stiffness in our intercourse with strangers, which are made against us from the same cause. If the freedom of Englishmen is spoken of on the continent, the reply almost invariably is, that if we are not slaves to our kings, we are slaves to our customs, and that the tyranny of etiquette is just as bad as any other. We should be sorry to have to count the number of times in which we have heard the English rule, that a man is not to salute a lady in the street till she has first set the example, cited as an instance of British social slavery. But the fact is, that a salutation on the continent means taking the hat off, and nothing else. With us, it means a great deal more, and would give liberties to persons who may chance to obtain a mere ball-room introduction, which, in our peculiar social position, might lead to very unpleasant results. In all nations, peculiarities, when once explained, mean very little. It is the commonest, but one of the gravest of mistakes, to judge a nation by its peculiarities.

There is much that is graceful, no doubt, in the French mode of understanding acquaintanceship. If one riding party of pleasure in the Pyrenees, for instance, meets another, the two parties instantly

salute. This is in itself gracious, and means in addition, that if there is any small service that the one party can render to the other, it will be cheerfully given. France is, in truth, the land of small services. With us, there is always the idea present, that such an act might be construed into something further. Our outward manners suffer in consequence, and something more perhaps, as in many instances small services may be avoided, under the impression that if they were given, larger might be required. The southern nations have no such fear, for, with them, great services are as rare as small ones are common. It is on this that the essential differences between the manners of the south and of the north of Europe are mainly founded.

The external grace of manner is as apparent amongst the French in the more difficult task of bowing strangers out as of ushering them in. The famous president, D'Harlay, was a master of the art. The supreme felicity with which he shewed unwelcome visitors the way to the door—the graceful expressions by which he accompanied each step in advance, till they had reached it, and the exquisite bow with which he closed it upon them, formed an artistic *ensemble* which could almost aspire to the name of genius. Even at the present day, the art of bowing out is an essential part of the education of a man of fashion on the continent. It is an art of which the Englishman has not the least idea: he ordinarily endures the infliction till he loses the patience necessary for the practical exercise of the feat, even if he knew how to perform it theoretically, and even this last useless point is one which he very seldom attains. Madame de Genlis somewhere gives an illustration of the difference of conduct of a French and an English exquisite under difficulties. She, in the first instance, cites the known story of Brummell, who revenged the affronts he had received from the prince-regent, by remarking in his hearing that he had grown as fat as a pig: such, at least, is her version of the story. On the other hand, Louis XV. once amused himself by asking one of his courtiers several times a day how old he was. The dandy repeated some twenty or thirty times that he was forty-five, till at last he lost patience, and told the king that he was forty-six. 'How so?' said the king: 'you told me an hour ago that you were forty-five?' 'That is true, sire; but I was afraid that your majesty would be tired by constantly hearing the same thing.' Goldsmith gives a similar illustration in one of his essays. A Frenchman and an Englishman, during a storm, offer each his cloak to a mutual friend. The Englishman entreats his friend to take the cloak, because, he says, it is not of the smallest use to himself—he would much rather be without it. The Frenchman, on the other hand, does not dissemble the utility of his cloak; in fact, he would not think of offering it to any one except to so dear a friend as his present companion. The tact by which the person present is made to suppose himself favoured above every one else, belongs almost exclusively to the Latin race. A French shopman, in making a bargain, invariably tells you that he offers you the wares at so low a price on account of his personal esteem for you; and this he does in a way that seldom fails to flatter you, notwithstanding the glaring falsity of the notion. If an Englishman were to do the same thing, he would do it in a way which would either disgust you, or cause you to laugh in his face.

The extreme to which this kind of compliment can be carried was reached by the Frenchman, who, when some one trod on his toes, and expressed his hopes that he had not hurt him, replied: 'Au contraire, monsieur.' A similar story is told of an Italian courtier who, when the grand-duke accidentally kicked one of his shins, presented the other with a '*mi fa piacere*.'

The innate love of truth which belongs to the

tonic character, and which has probably descended from the Scythians, is an insuperable barrier to the natives among us of this kind of politeness. Even our earnestness is often nothing more than truth run to seed. No race in the world ever lied with so bad a grace as the British. In nine cases out of ten, an Englishman, when he lies, betrays himself by the *gaucherie* of his manner of doing it. It is the same thing in little as in great things; we can neither carry on a plot by the means of secret societies, nor keep a friend out of our houses by expressions of love and good-will. Even an English farce, when it turns upon deceptions, is sure to be a bad one. When a British statesman tries his and at a piece of political humbug, there is not a stump-orator who is not able to expose it the next day.

Thus it is that our excuses, as well as our offers of service, get their gloss washed out in this damp island of ours. The glitter of the national costume suffers, no doubt. Butler has declared that there is great pleasure in being cheated; and if any cheat is pleasant, surely it is that of being cheated into the belief that all the world has a peculiar respect for your own individual self. It is true that as gloss is seldom used to cover a good article, there may be some reason alleged in favour of our own linsay-woolsey. It is not always pleasant to look at, but it bears rough weather.

We must, in some respects, defend the lower classes of the country from the imputation of ill-manners, so constantly levelled against them. Now, let any one who will venture upon such an attempt, or confess that he has ventured upon it, travel in a third-class carriage by an excursion-train. It is at any time worth the while of a student of English manners to make the experiment. Three-fourths of the party will probably consist of women and children, so that you must forget the quiet Birchin Lane clerk or country bookkeeper, who has ensconced himself in the corner. One of the noisier sex is taking a little child to the air for a few days' health; another has got a chubby-faced daughter about to see her grandmother for the first time; a third is going down to her sweetheart; almost the whole, in fact, are bent on some errand, either of hope or pleasure. As they tumble in, one after another, each laden with a most incongruous assemblage of packages, parcels, and bandboxes, they find half-a-dozen red hands stretched out to prevent their breaking their shins against the iron top, or rolling one of their misshapen boxes under the carriages. The elder ladies infallibly stick in the doorway, in a manner so ingeniously complex, that

would appear next to impossible for them to be extricated without an alarming sacrifice of personal property. However, they are used to sticking in doorways; and a series of evolutions, somewhat analogous to the bottle-trick of the conjuror, lands them to the inside of the vehicle, after crumpling up the member of one of their neighbours, and knocking a jaw of another under foot—things which the neighbours aforesaid take with such exemplary good-nature, that they seem actually to realise the Italian *fa piacere* without saying it. The first act of the newcomer is to fasten her little boy upon somebody's knee, and her baggage upon the first vacant seat, utterly regardless of the certainty that the said seat will be claimed in a few seconds by a fresh influx of visitors. The influx arrives, and the baggage has to be thrust into the holes and corners of the carriage; whereupon commences a universal shuffling of feet, tugging of elbows, and crumpling up of knees, consequent on the spasmodic attempts of the company to tuck twice as many articles under the seat as the floor will hold; and after the necessary failure of the attempt, they strew the floor with a miscellany of small bags and packages, till it resembles nothing so much as the floor of an ammunition tent after a lost

battle. All this, however, is done with the most perfect good-humour and absence of assumption or selfishness. It serves admirably for mutual introduction; the semi-destruction of a bonnet will make a friend for the journey, and a torn shawl would seem almost enough to create a friendship for life. Five minutes after the carriage is full, and the occupants shaken down, every one has picked out a friend, and the whole assembly is in high talk; and in half an hour, the history of the entire party—the object of the journey of each—what are their occupations and their peculiar tastes and talents—are as well known as if Momus had succeeded in his suggestion, that the next batch of mortals should be created with glass windows to their bosoms.

The contrast is certainly striking if you get to the aristocratic regions of a first-class carriage, more especially if it happens to be occupied by ladies; for frequently the behaviour of these to one another is marked by a stiff assertion of rights which amounts to downright incivility; and it is very seldom indeed that it unbends to anything like frankness or good-will. In this respect, the English traveller is a striking contrast to the continental: abroad, the most extreme civility and readiness to oblige is found in every department. In the lowest class, for good-humour and joviality, the advantage is, without doubt, according to our experience, on the side of the English, who are as cordial to their new associates as the continentals, and more true and open.

It is true that travellers by third-class in England, and almost all classes of foreigners, are in pursuit of pleasure; while in the superior classes in England, every second person, probably, is bound on some disagreeable errand. This makes an enormous difference in their several humours, and is a consideration which ought not to be confined to railway travelling. It is said that of seven persons who pass through Fleet Street, four are going into the city to get money, and three are coming back without it. On the Boulevards at Paris, out of twenty persons, nineteen are in pursuit of pleasure, and the twentieth thinks that he has found it. This ought to enter for no small part into all comparisons of national manners. Even when the Frenchman is on a business errand, he probably has managed so to mix it up with chances and expectations, as to gratify that intense hankering after excitement which is the characteristic of the nation. A Frenchman may carry on business out of necessity, but he never loves it except for the excitement which it may bring him. An Englishman, on the contrary, loves it for its own sake. Hence the demeanour of the one will naturally offer every possible contrast to that of the other; and there is no necessity for going back into national temperaments to find out the cause.

It is thus that the difference between the manners of the north and the south of Europe depends upon the habits rather than upon the temperament of the people. It is habit rather than temperament which with us causes an acquaintanceship to be a serious matter, while it is a mere matter of course with the southern nations. It is certainly not temperament which causes us to look upon business as a plain straightforward thing, with which the individual managing it is alone concerned—not as a medium of excitement and distraction, to be transacted in the midst of a crowd, with all the noise and animation of the habits of the south—habits which, whether conducive to success or not, are unquestionably conducive to the facilities of mutual intercourse. We know nothing more likely to frighten a timid traveller than the thundering noise which bursts at once from the fifty throats of as many continental *boursiers* the moment the clock of the town-hall has done striking twelve. It is, in short, to the different aspect under which our duties, both towards strangers and towards

society, present themselves, that our bearing towards strangers is due. In this respect, it is with our manners as with our houses—the dinginess is without, the comfort and hospitality within.

A LADRONE ADVENTURE IN THE CANTON RIVER.

OFTEN has our youthful imagination gloated over the daring deeds and hairbreadth escapes of bandits and pirates, traced in glowing colours by the pen of the poet or the novelist. Fascinated by the halo of romance thrown around their career, the deeds of freebooters rose up before us as the achievements of the purest heroism—their failure or fall, as an unmitigated evil—the more to be deplored on account of the nobility of the victim. These ideas, however, have been thoroughly dispelled. Practical experience has broken the coloured glass through which the deeds and the men were seen; and pirates on the seas, robbers on the highway, banditti among romantic mountains, and others of a similar class, now stand much on a level with housebreakers, pickpockets, and garotters at home. For the benefit of those readers whose imaginations are still spell-bound in the toils of romance, we propose to narrate the incident which first opened our eyes wide enough to see these things in their true light.

It was on a dull day in October 1852, that four of us—namely, our three friends, Jackson, Whympier, Lee, and ourselves, who am Jones, at your service—made up a party for an excursion from Canton down the river. Two of the party were on business, and of course they paid expenses. The others were glad to accept of the two remaining berths in the fast boat, in order to enjoy a couple of days' relaxation from the dull routine of business-life in Canton. We each carried a double-barrelled fowling-piece, as snipe and other wild-fowl were to be found down the river, and we anticipated that our leisurely sail might be enlivened with good sport. As for personal danger, that was out of the question. Occasional murders, it is true, had been committed on foreigners by the native fishermen down the river, but these were rare; and nobody had ever heard of an attack when more than a couple of Englishmen or Americans had to be met. A fast boat, which was to be our means of conveyance, is a large decked boat, with a house or cabin half sunk in the deck. At each end of the cabin there is a door, which leads up by two or three steps to the level of the deck, and inside there are two beds or berths, ranged on each side, and a dining-table in the centre. Besides this cabin, there is another in the forepart of the vessel, entirely below deck, in which the Chinese crew, who man the boat, find narrow quarters. We also provided ourselves with a pair of punts, each capable of carrying two people, which are useful in landing, crossing creeks, and other coast-service.

Late in the afternoon, we dropped gently down the river, now and again trying our fortune on some unhappy victim, whose flight brought it within reach. The sky was dull, and threatened rain. A dinner, as comfortable as could be enjoyed on board a fast boat, and a social evening passed rapidly away, and we turned in for the night. Next morning, we found ourselves at our destination—the Bogue Forts—where Jackson and Lee had business to transact, which occupied them during the greater part of the day; while Whympier and ourselves found what sport we could. Towards evening, we anchored off Tiger Island, to await the turning of the tide, and a favourable wind, to carry us back to Canton. As night drew on, it became intensely dark and cold, and we were fain to shut out the chill air, by closing both doors and windows all round the cabin. We were thus

seated enjoying some of Jackson's famous Burgundy, when we were startled by a sudden shock, as if some other boat had come into collision with ours, and the next moment we heard the report of a fire-pot,* which exploded on the forepart of our deck. We had heard no alarm from our crew, but the truth at once flashed across our minds that we were boarded by a gang of Chinese pirates, and should have to fight for our lives. Whympier, who sat nearest the door leading to the front-deck, immediately jumped out to reconnoitre; but he had no sooner shewn his head above board than he was assailed by half-a-dozen fire-pots, thrown by as many men, who had scrambled over the stern of our boat, and who were followed by as many more. In a moment, he was back in the cabin for his gun; but he had looked long enough to see, by the light of the missiles which had been thrown at him, that our assailants numbered from thirty to forty men, and that they had lashed their boat at right angles across the stern of ours, in the evident expectation that we should be a certain if not an easy prize.

Whympier was again on deck, and had his attention at once arrested by a stout fellow who was coming over the cabin roof, within six yards of where he stood. The pirate held a lighted fire-pot in his hand ready to discharge, which revealed the dim outline of his figure as he advanced; and Whympier, who was now joined by Lee and ourselves, took aim and fired. Owing to the dampness of the powder, the piece missed fire, and the Chinese was within three paces of where we stood, with his arm uplifted to launch his abominable missile, when the second barrel fortunately did its duty, and the man fell heavily on the cabin roof. Five or six men, each with a lighted fire-pot, were now advancing over the cabin roof, while many more were tumbling over the stern into our boat. One, two, three of our pieces were fired in rapid succession among them; each brought down its man, and effected a momentary check; but we only now discovered that in our hurry to face our antagonists, we had omitted to furnish ourselves with ammunition beyond what our artillery was charged with. We had, therefore, to make a hasty expedition into the cabin for our flasks and shot-pouches, and there found, to our dismay, that several fire-pots had been thrown into it and exploded, and were now showering sparks in all directions, and emitting their odorous smoke in volumes. Fortunately, the berths had previously been prepared for immediate occupation; and the woollen coverlets spread over them, protected the wooden frames from the burning sparks, or we should probably have had our citadel burned under our feet. In the midst of this smoke and fire, we groped our way to the further end of the cabin, where our supply of ammunition was deposited, and there a spear-thrust, aimed at Jackson, made us aware that the door at that end had been burst open, and thus exposed us to the danger of a double attack. Jackson was accordingly deputed to defend this point, and, as we afterwards found, he received a very severe burn on the back of his hand in the discharge of this duty. Having furnished ourselves with fresh supplies, which we carried through the cabin with the agreeable idea that a single unlucky spark might send us through the roof, we regained our first position on the front-deck, and were immediately greeted with a perfect shower of fire-pots, shot, and spears. These, with the help of a little dodging, we fortunately escaped, the only effect being the lodgment of a spear-head in the stock of the gun

* A fire-pot, or, as it is more commonly called, a stink-pot, is a small earthenware pipkin, filled with powder and other combustibles: it is lighted by means of a match, and then thrown with the hand. When it falls, it breaks, and emits a shower of sparks, which burn fiercely; these are followed by a dense smoke, and that again by an intolerable and suffocating stench, from which the missile takes its disagreeable name.

we carried; but we found the odds fearfully increased, and the rascals, taking courage from the temporary all in our fire, were coming in numbers over the cabin roof to attack us. If they should get near enough to grapple, our lives were not worth an hour's purchase, and, even as it was, the chances seemed tremendously against us; but we knew well that surrender was as hopeless as defeat, and our British blood boiled at the bare idea of succumbing to a crew of Chinese *ladrones*. It only remained, therefore, to fight it out; and with redoubled energy we poured upon them round after round in quick succession, with as much precision as the fitful glare of their fire-pots would allow. The short screams and heavy falls which followed each discharge informed us that our practice was not without effect; and after ten or fifteen minutes of uninterrupted firing, a partial clearance was effected of the roof of the cabin.

At this juncture, and ere we had yet ventured to breathe freely, we observed a man on board the *ladrone* boat passing a lantern forward to a group of five or six others, who stood in the bow, and whose figures were momentarily shewn in dim relief by the light thus thrown on them. In an instant, Lee's Joe Manton was at his shoulder, and the next moment a piercing scream from the direction where the light had appeared, made it evident that the shot had told. Whether it was their leader or some other person of consequence that Lee had brought down, we never could ascertain; but within half a minute after the shriek which announced his fall, our cabin roof was clear of intruders, and the whole crew of pirates were in full retreat, bearing with them those of their dead and wounded, whom, in their haste, they could conveniently pick up. We then for the first time relaxed our fire, as we had no desire for unnecessary carnage; but their loss had already been severe, amounting, as we afterwards learned, to seven or eight killed, besides several wounded, of whom we could get no exact account. As soon as they were all once more on board their own boat, they pushed off, exclaiming in their own language, that they would come back ere long, and murder the whole of us. They then dropped down the river, and anchored beside two other large boats, about 400 yards off, which had been lying there for some time, and which, as they never either attempted to render us assistance, or even to raise an alarm, we naturally took for accomplices, the crews of which had been drafted out of them to increase the attacking force. The pirates were no sooner out of the way, than our discreet Chinese crew began slowly to emerge from the hatchway of the fore-cabin, where they had concealed themselves the moment they saw the approach of danger, leaving us unaided to defend their boat from plunder. Of the three native boys whom we had with us, one jumped overboard in terror at the very first alarm, another crept down to the forehold beside the crew, and the remaining one, who, by the way, was Lee's servant, alone behaved like a trump, handing charges when required, loading a spare gun, and performing other little pieces of service which considerably facilitated our operations.

The threat uttered by the *ladrones* as they retired might or might not be a mere bravado; but it seemed not at all unlikely that there might be a sufficient number of reserved men in the two other boats to form a powerful reinforcement; and we were therefore rather disinclined to await a renewal of the fray. The tide, however, had not yet turned; the wind was not in our favour; and the idea of rowing a fast boat against wind, stream, and tide, was out of the question. We had the punts, no doubt, but they carried only two in each, and, including the servants, there were six people required to be accommodated. A council of war was held, and after brief deliberation, we concluded, as there was no other available means of escape, at all

hazards to take to the punts. These were accordingly rigged out; and Jackson and Lee took the one, while Whymper and ourselves occupied the other, each boat carrying besides one of the servants. The little vessels were loaded to the water's edge; the night was extremely dark; and the nearest point at which we could hope to find a friend who would receive us, was at Whampoa, a distance of twenty-five miles. Add to this the possibility, if not the probability, of pursuit by the exasperated pirates, which, had they overtaken us, in our present circumstances, would have been certain death, and some idea may be formed of the misery of our position. It was of consequence that our movements should be rapid, and we accordingly plied our strength to make the diminutive crafts fly through the water, while one in each boat strained his eyes to catch the first indications of approaching danger. We rowed thus for upwards of six hours, and arrived at Whampoa about three o'clock in the morning, when we at once made our way to the house of Mr Ward, an old friend of Lee's, who, he assured us, would accord us a hearty welcome. Our appearance was far from prepossessing—our faces begrimed with smoke and powder, our eyebrows and whiskers scorched partially off, our clothes burned in many places, and our hands sooty and smeared with blood; but the worthy old gentleman was no sooner sufficiently awake to understand our tale, than he all but embraced us, in his overwhelming expressions of sympathy. He rung up the servants to prepare hot coffee, spread a groaning table for our midnight tiffin; and after having again heard the particulars of our adventure, and taxed his ingenuity to find words strong enough to express his surprise and admiration, he ushered us to our couches, where we dreamed of Burgundy and fire-pots, snipe-shooting and deck-fighting, sinking punts and hospitable old gentlemen, till pretty far on in the next morning.

As soon as our late breakfast was concluded, our excellent host kindly furnished us with his own boat, and a crew to take us up to Canton, a distance of five miles, which we easily accomplished in an hour. The first object which met our eyes, on approaching the wharf, was the identical fast boat in which we had gone down the river, and which the crew had been able to get under-way within a couple of hours after we left it. Some of us were pretty well known in Canton, indeed any one who resides in Canton for a month cannot but become known to almost every member of the small English community who inhabit what are called the *Factories*; and when it became public that our fast boat had come back without us, and that it was stained with large quantities of blood, the greatest uneasiness had prevailed. The crew of the boat were questioned, but they could only tell of the fight on board, and that we had left them in the punts. We might have been drowned or murdered after that. As we drew near the wharf, we observed one or two groups of anxious-looking faces, and some excitement of demeanour; but we were no sooner observed approaching the landing, than three hearty cheers announced our welcome, and a dozen hands were held out in congratulation. We then learned also, that by an order from the consulate, to which office two of our party belonged, a government steamer was at that moment getting up steam, to proceed down the river in search of us, as there appeared sufficient ground to suspect that there had been foul play on the part of the natives. The steamer was detained till next day, when the true state of the case being known, and necessary particulars being furnished, it was despatched with a view, if possible, to apprehend some of the pirates, or obtain information as to their whereabouts; but after an absence of two days, it returned without success.

It would be too long to tell how we triumphed as

the lions of the Factories for at least a fortnight, till the whole thing had become stale, and we were ourselves tired of being fêted. After that, we settled down again into our old business routine; and we can assure the gentle reader that our brain was never more troubled with romantic dreams of gaily dressed corsairs, a thrust from whose rapier, or a ball from whose pistol, we had fancied must be rather pleasant than otherwise, and whose life bore a charm wherever they went. *Experientia docet*—but the proverb is somewhat rusty.

SCIENCE VERSUS POETRY.

POETRY has been well defined as

Truth severe in fairy fiction dressed;

for the office of the poet is to hold the mirror up to nature, and, like the painter, give a faithful reflection of whatever he may deem worthy of delineation; whether he reflects the truth of nature direct on the imagination of his reader, or the truth merely as it affects his own feelings and sentiments. Poetry, thus requiring exact accuracy of description, with great variety of embellishment, imperatively demands a correlative amount of knowledge in the poet. Indeed the word muse, as applied to poetical composition, is derived from a Greek phrase signifying to inquire; and as inquiry is the source or parent of all knowledge, the ancients considered the peculiar attribute of the presiding genius of poetry to be a knowledge of all things animate and inanimate, intellectual and corporeal. In every clime, and among every people, the poets were the first historians; and even laws, oracles, moral precepts, and religious rites, were in the earlier ages clothed in verse divine. Then poetry and science were one and the same; now they are at least twin-sisters; and though the onward strides of science are long and rapid, poetry may not, cannot lag behind—the two must ever keep pace, and walk hand in hand together. For, however difficult it may be to assign the definite limits of poetic licence, yet, whenever the poet, overstepping the modesty of nature, illustrates his verses with images founded on unnatural, or, which is the same thing, unscientific conclusions, the pleasure derivable from the poetry is marred by the incongruous associations and distorted fancies presented to our minds. The long muster-roll of qualifications requisite to constitute a poet, as detailed by Imlac to Rasselas, were probably never possessed by any human being; yet such is the inspiration of the art, that few aggressions against natural science are found among many volumes of immortal verse. Of these few, our object is to notice some, if not altogether for the instruction, may we hope for the amusement of the reader.

Hamlet argumentatively says: 'If the sun breed maggots in a dead dog,' and proceeds to draw an inference from his postulate, without in the slightest degree questioning its accuracy. That the sun had such a creative power, and the corruption of animal matter spontaneously produced insects, was the general opinion in the time of Shakspeare; and, in fact, a belief in what naturalists now term equivocal generation, is as ancient as the Augustan era of old Rome, when Virgil, for the benefit of husbandmen, minutely described the whole process of spontaneously producing a swarm of bees. A steer of two years old having first been killed, the poet, as translated by Dryden, thus proceeds:

They leave the beast, but first sweet flowers are strewed
Beneath his body, broken boughs, and thyme,
And pleasing cassia just renewed in prime.
This must be done ere spring makes equal day,
When western winds on curling waters play:
Ere painted meads produce their flowery crops,
Or swallows twitter on the chimney-tops.

The tainted blood, in this close prison pent,
Begins to boil, and through the bones ferment;
Then, wondrous to behold, new creatures rise,
A moving mass at first, and short of thighs;
Till shooting out with legs, and impeded with wings,
The grubs proceed to bees with pointed stings,
And more and more affecting air, they try
Their tender pinions, and begin to fly.

In all probability, Virgil was deceived by the very great natural resemblance existing between the bee and the *syrrhus*, a species of blow-fly; and though his contemporaries had full faith in the infallibility of his directions, it would be difficult to find any one, at the present day, so ignorant as to believe that insects could be produced in a foreign body, except from eggs previously deposited.

Among all the manifold marvels of nature, nothing is more wonderful than the varied changes insects undergo during their short existence. In the moth tribe, to which we more particularly wish to refer, the egg, deposited in a suitable locality, is in course of time hatched into a crawling, many-legged caterpillar. In this state, it eats voraciously, and casts its skin several times. Having arrived at its full growth as a caterpillar, it casts its skin for the last time, becoming a nymph or chrysalis, an oviform mass without external mouth, eyes, or limbs; and in deathlike torpor awaits its final transformation, when, bursting its cell, it flies forth a beautiful and perfect insect, to propagate its kind, and die in a few days, perhaps hours. This mysterious series of progressive perfectibility has frequently afforded both poet and philosopher a fine emblem of the immortality of the soul; but in the following lines the poet, reversing the real order of nature, erroneously describes the perfect moth as assuming the imperfect state of the nymph:

Thus the gay moth, by sun and vernal gales,
Called forth to wander o'er the dewy vales,
From flower to flower, from sweet to sweet, will stray,
Till tired and satiate with her food and play,
Deep in the shades she builds her peaceful nest,
In loved seclusion pleased at length to rest:
There folds the wings that erst so widely bore,
Becomes a household nymph, and seeks to range no more.

Darwin commits a somewhat similar error, when alluding to the 'old grub, time out of mind the fairies' coachmaker.'

So sleeps in silence the curculio, shut
In the dark chamber of the caverned nut;
Erodes with ivory beak the vaulted shell,
And quits on filmy wings its narrow cell.

Now, the curculio or weevil passes its larva state of existence only in the nut, and having eaten its way out, falls to the ground, where it becomes a chrysalis; and then undergoing its last change, acquires its 'filmy wings' in the earth, and not, as Darwin has it, in 'the vaulted shell.'

Few but have witnessed, in autumnal mornings, the filmy threads termed gossamer, which in some localities are so plentiful as to carpet the earth and clothe the hedges in their shining dew-be sprinkled folds. It is now well known that this substance is the work of two species of spider, though naturalists are not as yet agreed with respect to the exact mode of its production. Our ancestors, however, held that gossamer was dew scorched by the sun. Spenser speaks of

The fine nets which oft we woven see
Of scorched dew;

and another poet thus alludes to the same phenomenon

As light and thin as cobwebs that do fly
In the blue air, caused by the autumnal sun,
That boils the dew that on the earth doth lie.

In an old romance, at one time the book of its season,

but now completely forgotten, named *Mandeville*, the author describes a ruined castle inhabited by owls and bitterns. Now, though the bittern has been mentioned even in Scripture as the emblem of desolation, it is not the desolation of a ruined castle, but of some wild upland marsh, far from the dwellings of man, irreclaimable by his energies, and incapable of affording sustenance to the animals he domesticates. There the bittern abides in dreary solitude; and in the still nights of spring, ascending by a spiral flight to a great altitude, he serenades his mate, engaged in the maternal duties of the nest below: and it is a most extraordinary serenade. Let the reader fancy a burst of uncouth fiendish laughter, gratingly, piercingly loud, as if the bellow of a bull were mingled with the neigh of a horse, and he will have a faint idea of the wild boom of the bittern—as wild as the desert morass over which it resounds. As the bird booms, the listener really fancies that the unstable quagmire beneath his feet is shaken by the noise; and this circumstance may be accounted for by the general affection of the sentient system caused by the rude jar upon the ear, a feeling experienced with other harsh grating sounds. From a very early period, however, the popular notion has been that the bittern boomed by plunging his bill in the muddy marsh; and Thomson has not only adopted this absurd idea, but also ascribed the season of booming to an earlier part of the year than when it actually takes place:

As yet the trembling year is unconfirmed,
And winter oft at eve resumes the breeze,
Chills the pale morn, and bids his driving alets
Deform the day delightless—so that scarce
The bittern knows his time, with bill engulfed,
To shake the sounding marsh; or from the shore
The plovers, when to scatter o'er the heath,
And sing their wild notes to the listening waste.

In the *Lady of the Lake*, a fine description of the solitary desolation of an ancient battle-field is sadly deteriorated by a simple error regarding the natural habit of a well-known bird:

The knot-grass fettered there the hand
Which once could burst an iron band;
Beneath the broad and ample bone,
That bucklered heart to fear unknown,
A feeble and a timorous guest,
The fieldfare, framed her lowly nest.

The fieldfare is truly a timorous guest, but it is a winter one. It never frames a nest in this country; and if it did remain with us during the summer, it would, like all the rest of its tribe, build in a tree, and not on the ground. Milton, in his *Lycidas*, in verses of singular elegance, almost offends our sensibilities by enumerating as 'vernal flowers' many which are the production of summer and early autumn:

Ye valleys low, where the mild whispers use
Of shades, and wanton winds, and gushing brooks,
On whose fresh lap the swart star sparsely looks,
Throw hither all your quaint enamelled eyes,
That on the green turf suck the honied showers,
And purple all the ground with vernal flowers.
Bring the rathe primrose that forsaken dies,
The tufted crow-toe, and pale jessamine,
The white-pink, and the pansy freaked with jet,
The glowing violet,
The musk-rose, and the well-attired woodbine,
The cowslip wan that hangs the pensive head,
And every flower that sad embroidery wears:
Bid amaranthus all his beauty shed,
And daffodillies fill their cups with tears,
To strew the laureat hearse where Lycid lies.

The sense of hearing in the mole is well known to be most exquisite, and Shakespeare ably alludes to the

fact; but he is in error with respect to the animal being blind:

Pray you, tread softly, that the blind mole may not
Hear a footfall.

The mole has eyes, and though a limited power of vision might seem sufficient for such a 'dweller in the dark,' it can see better than is generally imagined. After all, we can scarcely blame the great poet for merely repeating a very common error of his period; while, on the other hand, he declares that crickets can hear—a fact which was denied by entomologists down almost to the present day:

I will tell it softly, young crickets shall not hear me.

It was Brunelli, an Italian naturalist, who first proved that insects had a sense of hearing, by experimenting with crickets. He shut up several of these noisy, but not altogether unharmonious insects in an apartment where they would chirp all day, if he did not alarm them by knocking on the door; and at last he learned to imitate their chirp so well, that they regularly replied to him. Moreover, he confined a male cricket on one side of his garden, placing a female on the other, but at liberty; and as soon as the lady-cricket heard the merry chirp of her imprisoned beau, she made the best of her way to comfort and solace him.

It would be hypercritical to find fault with Shakespeare in *Midsummer Night's Dream*, where he makes Titania tell her fairy attendants to be kind and courteous to Bottom, and to

Feed him with apriocks and dewberries,
With purple grapes, green figs, and mulberries;
The honey bags steal from the humble bees,
And for night tapers, crop their waxen thighs,
And light them at the fiery glowworm's eyes,
To have my love to bed and to arise.

In reality, the light of the glowworm is not in the head, but at the opposite extremity of its body. But Moore is certainly open to censure where one of his angels talks of

the light
The glowworm hangs out to allure
Her mate to her green bower at night.

For both the winged male, as well as wingless females, and even their larvæ, also possess the light; and the best entomologists admit that they cannot satisfactorily explain the cause or object of the singular phosphorescent phenomenon exhibited by this insect.

The paper nautilus, *Argonauta Argo*, has long been a favourite simile, and a sad stumbling-block among the poetic race:

Learn of the little nautilus to sail,
Spread the thin oar, and catch the driving gale.

It is to Madame Jeannette Power, a French lady-naturalist, whose experiments and observations have received the highest praise from Professor Owen and other distinguished European savans, that we are indebted for the true history and nature of the argonaut. Keeping a quantity of these beautiful *cephalopods* in a large marine vivarium in Sicily, Madame Power was enabled to observe their habits with the greatest minuteness. The two velated dorsal arms, that the poets imagined to be sails, are in fact the covering of the shell, which they enclose like the mantle of the cowrie, and by their calcifying power, not only in the first instance form the shell, but afterwards keep it in repair. The so-called oars are not used when the animal is moving through the water, but protruded forwards from the head to be out of the way—the motion being in a backward direction, and produced, as in all the cuttle tribe, by the alternate expansion and contraction of the sac, and ejection of water

through the siphon. A steam fishing-vessel, recently constructed at one of the Scotch ports, was propelled in a not very dissimilar manner.

A still more extraordinary wonder of the deep has been commemorated in poetry; Milton mentions that 'sea-beast'

Which God of all his works
Created hugest that swim the ocean flood.
Him haply slumbering on the Norway foam,
The pilot of some small night-foundered skiff,
Deeming some island oft, as seamen tell,
With fixed anchor in his scaly rind
Moors by his side.

Yet we can scarcely blame Milton for alluding to this animal, the mythical kraken—

On the deep
Stretcht like a promontorie—

that had previously been described by Olaus Magnus and Bishop Pontoppidan. Gesner, too, the leading naturalist of the age, presents us with an engraving of it, in which the 'scaly rind' forms a prominent feature. Milton also qualifies his description with the words 'as seamen tell.' Undoubtedly, one of these seamen was Sinbad, the Arabian Ulysses, who, taking the animal for an island, landed to cook his dinner upon it, and in consequence nearly lost his life. The companions of St Brandanus, the Irish Sinbad, were taken in and done for in the very same manner by 'a great fish named Jasconye, which laboureth night and day to put his tail in his mouth, but for greatness he may not.'

Moore sings of an island, which, if more poetical than the one formed by the huge 'sea-beast slumbering on the Norway foam,' is quite as irreconcilable with common sense and the fixed laws of nature:

Oh, had we some bright little isle of our own,
In a blue summer ocean far off and alone,
Where a leaf never dies in the still blooming bowers,
And the bee banquets on through a whole year of flowers.

An island where a leaf never dies, and the flowers bloom all the year round, must be situated in the tropics, where there is almost no twilight, where the moment the sun sets, darkness covers the earth, and when it rises, day as suddenly succeeds to night. But Moore continues:

Where the sun loves to pause
With so fond a delay,
That the night only draws
A thin veil o'er the day.

These last lines accurately describe a summer night in the extreme northern islands of Scotland, or in Norway, where the slight depression of the sun beneath the horizon causes a short night, not of darkness, but of twilight. In fact, Moore, in the above lines, has combined two incompatible conditions—a perpetual summer and short night of twilight, the first found near the equator only, the last towards the pole.

Poets and moralists have in all times celebrated the industry and alleged foresight of the ant, upholding the tiny insect as a lesson and example to mankind. But although the diligence of the ant tribe is unquestionable, still it is well known now that the European ants at least do not lay up a store of food for the winter; nor do they require it, as they pass the cold weather in a state of torpidity. Still there can be no doubt that, in eastern climes, ants provide a store of provisions to last them over the rainy season, when they are unable to go abroad—just as several species of wasps in South America store honey, though their European representatives do not. In the *Transactions of the Entomological Society*, there is an interesting account of a tribe of ants, observed by Colonel Sykes, at Poonah, in India, which carefully dry and store up the seeds of

a kind of grass (*panicum*), for no other imaginable purpose but for food. So the wise king was, morally and zoologically speaking, correct when he said: 'Go to the ant, thou sluggard; consider her ways and be wise: which having no guide, overseer, or ruler, provideth her meat in the summer, and gathereth her food in the harvest.'

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XLIII.

A CHAPTER OF EXPLANATIONS.

THE fight could not have lasted more than ten minutes. The whole skirmish had the semblance of a moonlight dream, interrupted by interludes of darkness. So rapid had been the movements of the forces engaged, that after the first fire, not a gun was reloaded. As for the guerrilleros, the Indian war-cry seemed to have shaken the pieces out of their hands, for the ground where they had first broken off was literally strewn with carbines, escopettes, and lances. The great gun of El Zorro was found among the spoils.

Notwithstanding the shortness of the affair, it proved sufficiently tragical to both Mexicans and Indians: five of the guerrilleros had bit the dust, and twice that number of savage warriors lay lifeless upon the plain—their bodies glaring under the red war-paint, as if shrouded in blood. The Mexicans lay near the foot of the mesa, having fallen under the first fire of the Rangers, delivered as they galloped up. The Indians were farther out upon the plain, where they had dropped to the thick rapid detonations of the revolvers, that, so long as the warriors held their ground, played upon them with fearful effect. They may have heard of this weapon, and perhaps have seen a revolver in the hands of some trapper or traveller, but, to my knowledge, it was the first time they had ever encountered a band of men armed with so terrible a power to destroy; for the Rangers were indeed the first military organisation that carried Colt's pistol into battle—the high cost of the arm having deterred the government from extending it to other branches of the service.

Nor did the Rangers themselves come unscathed out of the fight: two had dropped dead out of their saddles, pierced by the Comanche spear; while nearly a dozen were more or less severely wounded by arrows.

While Quackenboss was climbing the cliff, Garey and I found time to talk over the strange incidents to which we had been witness. We were aided by explanations from below, but, without these, we had no difficulty in comprehending all. The Indians were a band of Comanches, as their war-cry had already made known to us. Their arrival on the ground at that moment was purely accidental, so far as we or the Mexicans were concerned: it was a war-party, and upon the war-trail, with the intention of reiving a rich Mexican town on the other side of the Rio Grande, some twenty leagues from the rancheria. Their spy had discovered the horsemen by the mesa, and made them out to be Mexicans—a foe which the lordly Comanche holds in supreme contempt. Not so contemptible in his eyes are Mexican horses, silver-studded saddles, speckled serapes, mangas of fine cloth, bell-buttoned breeches, arms, and accoutrements; and it was to sweep this paraphernalia that the attack had been made; though hereditary hatred of the Spanish race—old as the Conquest—and revenge for more recent wrongs, were of themselves sufficient motives to have impelled the Indians to their hostile attempt. All this we learned from one of their braves, who remained wounded upon the ground, and who, upon closer

examination, turned out to be a *ci-devant* Mexican captive, now completely Indianised!

Fortunately for the Mexican town, the savages, thus checked, abandoned their design, and returned to their mountain fastnesses sadly humbled.

The rest of the affair was still of easier explanation to Garey and myself. Rube, as we conjectured, had arrived safe at the rancheria; and in ten minutes after his story had been told, fifty Rangers, with Holingsworth at their head, rode rapidly for the mesa. Rube had guided them with his usual craft. Like the Indians, they had been moving forward during the intervals of darkness; but, coming in the opposite direction, they had kept the mound between them and their foe, and, trusting to this advantage, were in hopes of taking the guerrilleros by surprise. They had approached almost within charging distance, when the war-whoop of the savage sounded in their ears, and they were met by the retreating band. Knowing that all who came that way must be enemies, they delivered their fire upon the approaching horsemen, and then galloping forward, found themselves face to face with the painted warriors of the plains. The mutual surprise of Rangers and Indians, caused by the unexpected rencontre, proved a happy circumstance for the cowardly guerrilla, who, during the short halt of their double pursuers, and the confused fight that followed, were enabled to gallop off beyond reach of pursuit.

It was a curious conjecture what would have been the result had the Rangers not arrived on the ground. Certainly the Indians would have rescued us from our not less savage foes. My companion and I might have remained undiscovered, but we should have lost our precious horses. As it was, we were soon once more upon their backs; and, free from all thought of peril, now joyfully turned our faces towards the rancheria.

Wheatley rode by my side. Holingsworth with a party remained upon the ground to collect the 'spoils' and bury our unfortunate comrades. As we moved away, I turned, and for a moment gazed back on the scene of strife. I saw Holingsworth dismounted on the plain. He was moving among the bodies of the five guerrilleros; one after another, he turned them over, till the moon glared upon their ghastly features. So odd were his movements, and so earnest did he appear, that one might have fancied him engaged in searching for a fallen friend, or more like some prowling robber intent upon stripping the dead! But neither object was his—on the contrary, he was searching for a foe. He found him not. After scanning the features of all five, he was seen to turn away, and the unconcerned manner in which he moved from the spot, told that he who was sought was not among the slain.

'The news, Wheatley?'

'News, Cap! Grand news, by thunder! It appears we have been barking up the wrong tree—at least so thinks President Polk. They say we can't reach Mexico on this line; so we're all going to be drawn off, and shipped to some port further down the gulf—Vera Cruz, I believe.'

'Ah! grand news indeed.'

'I don't like it a bit,' continued Wheatley; 'the less so since it is rumoured that old "Rough and Ready" is to be recalled, and we're to be commanded by that book-martinet Scott. It's shabby treatment of Taylor, after what the old vet has accomplished. They're afraid of him setting up for president next go. Hang their politics! It's a confounded shame, by thunder!'

I could partly understand Wheatley's reluctance to be ordered upon the new line of operations. The gay lieutenant was never troubled with ennui; his leisure hours he contrived to pass pleasantly enough in company with Conchita, the plump, dark-eyed daughter of the alcadé; more than once, I had unwittingly

interrupted them in their amorous dalliance. The rancheria with its mud huts and dusty lanes, in the eyes of the Texan, was a city of gilded palaces, its streets paved with gold. It was Wheatley's heaven, and Conchita was the angel who inhabited it. Little as either he or I had liked the post at first, neither of us desired a change of quarters.

As yet, no order had arrived to call the picket in, but my companion affirmed that the camp-rumour was a substantial one, and believed that we might expect such a command at any moment.

'What say they of me?' I inquired.

'Of you, Cap? Why, nothing. What do you expect them to say of you?'

'Surely there has been some talk about my absence?'

'Oh, that! No, not a word, at least at head-quarters, for the simple reason, that you're not yet reported missing.'

'Ah! that is good news; but how?—'

'Why, the truth is, Holingsworth and I thought we might serve you better by keeping the thing dark—at all events, till we should be sure you were dead lost. We hadn't given up all hope. The greaser who guided you out, brought back word that two trappers had gone after you. From his description, I knew that queer old case Rube, and was satisfied that if anything remained of you, he was the man to find it.'

'Thanks, my friend! you have acted well; your discreet conduct will save me a world of mortification.'

'No other news?' I inquired after a pause.

'No,' said Wheatley; 'none worth telling. O yes!' he continued, suddenly recollecting himself, 'there is a bit. You remember those hang-dog greasers that used to loaf about the village when we first came? Well, they're gone, by thunder! every mother's son of them clean *vamosed* from the place, and not a grease-spot left of them. You may walk through the whole settlement without seeing a Mexican, except the old men and the women. I asked the alcadé where they had cleared to; but the old chap only shook his head, and drawled out his eternal "Quien sabe?" Of course they're off to join some band of guerrillas. By thunder! when I think of it, I wouldn't wonder if they were among that lot we've just scattered. Sure as shootin', they are! I saw Holingsworth examine the five dead ones as we rode off. He'll know them, I guess, and can tell us if any of our old acquaintances are among them.'

Knowing more of this matter than Wheatley himself, I enlightened him as to the guerrilleros and their leader.

'Thought so, by thunder! Rafael Ijrra! No wonder Holingsworth was so keen to start—in such a hurry to reach the mound, he forgot to tell me who we were after. Deuce take it! what fools we've been to let these fellows slide. We should have strung up every man of them when we first reached the place—we should, by thunder!'

For some minutes, we rode on in silence. Twenty times a question was upon my lips, but I refrained from putting it, in hopes that Wheatley might have something more to tell me—something of more interest than aught he had yet communicated. He remained provokingly silent.

With the design of drawing him out, I assumed a careless air, and inquired:

'Have we had no visitors at the post? Any one from the camp?'

'Not a soul,' replied he, and again relapsed into meditative silence.

'No visitors whatever? Has no one inquired for me?' I asked, determined to come boldly to the point.

'No,' was the discouraging reply.—'Oh, stay: oh, ah—yes, indeed!' he added, correcting himself, while I could perceive that he spoke in a peculiar tone. 'Yes, you were inquired for.'

'By whom?' asked I, in a careless drawl.

'Well, that I can't tell,' answered the lieutenant, in an evident tone of badinage; 'but there appears to be *somebody* mighty uneasy about you. A slip of a Mexican boy has been backward and forward something less than a million of times. It's plain *somebody* sends the boy; but he's a close little shaver that same—won't tell either who sends him, or what's his business: he only inquires if you have returned, and looks dead down in the mouth when he's told no. I have noticed that he comes and goes on the road that leads to the hacienda.'

The last words were spoken with a distinct emphasis. 'We might have arrested the little fellow as a spy,' continued Wheatley, in a tone of quiet irony, 'but we fancied he might have been sent by some friend of yours.'

The speaker concluded with another marked emphasis, and under the moonlight I could see a smile playing across his features. More than once I had 'chaffed' my lieutenant about Conchita; he was having his revenge.

I was not in a mood to take offence; my companion could have taken any liberty with me at that moment—his communication had fallen like sweet music upon my ears, and I rode forward with the proud consciousness that I was not forgotten. Isolina was true.

Soon after, my eyes rested upon a shining object; it was the gilded vane of the little capilla, and beneath glistened the white walls of the hacienda, bathed in the milky light of the moon. My heart beat with strange emotions as I gazed upon the well-known mansion, and thought of the lovely jewel which that bright casket contained. Was she asleep? Did she dream? Of what—of whom, was she dreaming?

CHAPTER XLIV.

DUTCH LIGE IN A DIFFICULTY.

The soft blue light of morning was just perceptible along the eastern horizon as we rode into the rancheria. I no longer felt hunger. Some of the more provident of the rangers had brought with them well-filled haversacks, and had made me welcome to the contents. From their canteens I had satisfied my thirst, and Wheatley as usual carried his free flask.

Relieved of the protracted strain upon my nerves—of fear and vigil—I felt deadly weary, and, scarcely undressing, I flung myself upon my leathern *catré*, and at once fell asleep.

A few hours' repose had the desired effect, and restored both the strength of my body and the vigour of my mind. I awoke full of health and hope. A world of sweet anticipations was before me. The sky and fortune were both smiling.

I made my toilet with some care—my *desayuna* with less—and then, with lighted cigar, ascended to my favourite lounge on the azotes.

The beautiful captive was in the midst of a crowd, proudly curving his neck, as if conscious of the admiration he excited. The rangers, the poblanas, the hucksters of the plaza, even some sulky lepers stood near, gazing with wondering eyes upon the wild-horse.

'Splendid present!' thought I—'worthy the acceptance of a princess!'

It had been my intention to make the offering in person—hence the care bestowed upon my toilet. After more mature reflection, I abandoned this design. I was influenced by a variety of considerations—one, among others, being a delicate apprehension that a personal visit from me might compromise the family at the hacienda. The patriotic sentiment was every day growing more intense. Even the acceptance of a present was a dangerous matter; but the steed was not to be a gift—only a return for the favourite that

had fallen by my hand—and I was not to appear in the character of a donor.

My sable groom, therefore, would convey the beautiful captive. Already the white lazo, formed into a halter, was adjusted around the animal's head, and the negro only awaited orders to lead him away.

I confess that at that moment I felt somewhat annoyed at the publicity of my affair. My rough rangers were men of keen intelligence. I could tell from some whispers that had reached me, that one and all of them knew *why* I had gone upon the wild hunt, and I dreaded their good-humoured satire. I would have given something at that moment to have rendered the steed invisible—to have been able to transport him to his destination, Venus-like, under cover of a cloud. I thought of waiting for the friendly shelter of night.

Just then, however, an incident occurred which gave me the very opportunity I wanted—a scene so ludicrous, that the steed was no longer the cynosure of admiring eyes. The hero of this scene was Elijah Quackenboss.

Of all the men in my band, 'Dutch Lige' was the worst clad. Not that there was less money expended upon his outward man; but partly from his ungainly form and loose untidy habits, and more, perhaps, from the wear and tear caused by his botanising excursions, a suit of broadcloth did not keep sound upon him for a week. He was habitually in tatters.

The skirmish of the night had been profitable to Lige; it was his true aim that had brought down one of the five guerrilleros. On his asserting this, his comrades had laughed at it as an idle vaunt; but Quackenboss proved his assertion to be correct by picking his bullet out of the man's body, and holding it up before their eyes. The peculiar 'bore' of his rifle rendered the bullet easy of identification, and all agreed that Lige had shot his man.

By the laws of ranger-war, the spoils of this particular individual became the property of Quackenboss; and the result was, that he had shaken off his tattered rags, and now appeared in the plaza in full Mexican costume—comprising calzoneros and calzoncillos, sash and serape, jacket and glazed hat, boots with gigantic spurs—in short, a complete set of *ranchero* habiliments!

Never was such a pair of legs incased in Mexican velveteens—never were two such arms thrust into the sleeves of an embroidered *jaqueta*; and so odd was the *tout ensemble* of the ranger thus attired, that his appearance in the plaza was hailed by a loud burst of laughter, both from his comrades and the natives who stood around. Even the gloomy Indians shewed their white teeth, and joined in the general chorus.

But this was not the end. Among other spoils, Lige had made capture of a Comanche mustang; and as his own war-horse had been for a long time on the decline, this afforded him an excellent opportunity for a remount. Some duty of the day had called him forth, and he now appeared in the plaza leading the mustang, to which he had transferred his own saddle and bridle. A fine handsome horse it appeared. More than one of his comrades envied him this splendid prize.

The laughter had scarcely subsided, when the order was given to mount; and with others, Quackenboss sprang to his horse. But his hips were hardly snug in the saddle, when the wicked Comanche 'humped' his back and entered upon a round of kicking which seemed to exhibit every pose and attitude of equestrian exercise. First his hind-feet, then his fore ones, then all together, could be seen glancing in the air. Now a hoof whizzed past the ear of the affrighted rider, now a set of teeth threatened his thighs, while every moment he appeared in danger of being hurled with violence to the earth. The

mlbrero had long since parted from his head, and the le from his hand; and what with the flapping of a wide trousers, the waving of the loose serapé, the swing of the steel scabbard, the distracted motion of a rider's arms, his lank streaming hair and look of ror—all combined to form a spectacle sufficiently dicrous; and the whole crowd was convulsed with ighter, and the plazza rang with shouts of 'Bravo!' 'Vell done, Lige!' 'Hooraw for you, old beeswax!' But what surprised his comrades, was the fact that ackenbos still kept his seat. It was well known at he was the worst rider in the troop; yet despite the doubling and flinging of the mustang, that had lasted for several minutes, he was still safe in e saddle. He was winning golden opinions upon e strength of his splendid horsemanship! The agers were being astonished.

All at once, however, this mystery was explained, d the cause of his firm seat discovered. One of the standers, sharper than the rest, had chanced to look der the belly of the mustang, and the next moment uted out:

'Hoy! look yonder! by Geehorum, his spurs are icked!'

All eyes were lowered, and a fresh peal of laughter roke forth from the crowd as they perceived that is was in reality the case.

Lige, upon mounting—under the suspicion that the outang was disposed for a fling—had clutched firmly ith his legs, and these, on account of their extreme engh, completely enveloped the body of the animal, o that his heels met underneath. He had forgotten e now spurs, the rowels of which, six inches in ameter, irritated the mustang, and were no doubt e cause of such violent kicking. These, after a few uns, had got 'locked,' and of course held Quacken- os as firmly as if he had been strapped to the saddle. ut as the rowels were now buried in the ribs of the mustang, the fierce brute, maddened with the pain, ily grew more furious at each fling, and it was atural enough he should do his utmost to rid himself f so cruel a rider.

How long he might have kept up the pitching frolic ore his involuntary tormentor could have freed himself, is a matter of conjecture. It would have been a unfortunate 'fix' to have been placed in, alone pon the prairies.

Lige, however, found a compassionate bystander, ho, having flung his lazo around the neck of the mustang, brought the spectacle to a termination.

CHAPTER XLV.

A LOVER ON THE TRAIL.

Taking advantage of the distraction caused by Quackenbos and his troubles, I despatched the black pon his interesting errand, and with no slight anxiety waited the result.

From my position on the roof, I saw my messenger limb the hill, leading the proud steed, and saw them enter the great portal of the hacienda.

Promptly—almost directly—the groom came out again without the horse. The present had been accepted. So far well.

I counted the moments, till heavy footsteps were heard upon the escalera, and a shining black face rose over the roof.

There was no letter, no message beyond 'mil gracias.'

I felt a pang of chagrin. I had expected thanks more formal than this mere phrase of compliment.

My man appeared better satisfied. A gold onza gleamed in his purple palm—a handsome perquisite.

'By whom given?' I inquired.

'Golly, mass cap'n! De handsomest quaderoom gal de riggs ever see guv it.'

Beyond a doubt, Isolina herself was the donor! I could have broken the rascal's thick skull but that the queenly douceur gave proof of the satisfaction with which my offering had been received. Even on this trivial circumstance, I built my hopes of yet receiving a fuller meed of thanks.

Absorbed in these hopes, I continued to pace the azotea alone. It was a *dia de fiesta* in the rancheria. Bells had already commenced their clangour, and other notes of preparation fell upon the ear. The poblanos appeared in their gayest attire—the Indians in bright naguas, with red and purple threads twisted in their black hair; the denizens of the ranchitos were pouring into the plazza, and processions were being formed by the church; *jaramas* were twanging their guitar-like music; and pyrotechnic machines were set up at the corners of the streets. Tinsel-covered saints were carried about on the shoulders of painted maskers; and there were Pilate and the Centurion, and the Saviour—a spectacle absurd and unnatural; and yet a spectacle that may be witnessed every week in a Mexican village, and which, with but slight variation, has been exhibited every week for three centuries!

I had no eyes for this disgusting fanfaronade of a degrading superstition. Sick of the sight, wearied with the sounds, I had given orders for my horse to be saddled, intending to ride forth and seek repose for my spirit amid the silent glades of the chapparal.

While waiting for my steed, an object came under my eyes that quickened the beatings of my pulse: my gaze had been long turned in one direction—upon the hacienda of Don Ramon de Vargas.

Just then, I saw emerging from its gate, and passing rapidly down the hill, a horse with a rider upon his back.

The snow-white colour of this horse, and the scarlet manga of the rider, both contrasting with the green of the surrounding landscape, could not escape observation even at that distance, and my eyes at once caught the bright object. I hesitated not to form my conclusion. It was the white steed I saw; and the rider—I remembered the manga as when first my eyes rested upon that fair form—the rider was Isolina. She was passing down the slope that stretched from the hacienda to the river bottom, and the minute after, the thick foliage of the platanus trees shrouded the shining meteor from my sight.

I noticed that she halted a moment on the edge of the woods, and fancied that she gazed earnestly towards the village; but the road she had taken led almost in the opposite direction.

I chafed with impatience for my horse. My resolve, made on the impulse of the moment, was to follow the white steed and his scarlet-clad rider.

Once in the saddle, I hurried out of the plazza, passed the ranchos of yucca, and reaching the open country, pressed my horse into a gallop.

My road lay up the river, through a heavily timbered bottom of gum and cotton woods. These were thickly beset with the curious *tillandsia*, whose silvery festoons, stretching from branch to branch, shrouded the sun, causing amongst the tree-trunks the obscurity of twilight.

In the midst of one of these shadowy aisles, I met or passed some one; I saw that it was a Mexican boy; but the sombre light, and the rapidity with which I was riding, prevented me from noting anything more. The lad shouted after me, uttering some words, which were drowned by the hoof-strokes of my horse. I deemed it some expression of boyish *esprit*, and, without heeding it, rode on. Not until far out of sight and hearing did it occur to me that I knew the voice and the lad. I recollected a sort of errand-boy attached to the hacienda, and whom I had seen more than once at the rancheria. I now remembered the badinage of Wheatley, and would have returned

to question the youth; but I had left him too far in the rear. After a moment's reflection, I spurred on.

I soon arrived at the base of the hill on which stood the hacienda; and here, leaving the main road, I followed a bridle-path that skirted the hill. A few hundred yards brought me to the spot where I had last observed the object of my pursuit. The hoof-track of the white horse now guided me, and upon his trail I entered the woods.

For some distance, it followed a well-trodden path—a cattle track—but all at once it diverged from this, and struck off into a heavily timbered bottom, where not the semblance of path existed. Keeping the trace in view, I rode after.

As I advanced, the timber grew thicker, and the path more difficult. A close underwood of arundinaria and sabal palms shut up the way and the view; trailing roots obstructed progress below; while higher up, the trellis-work of lianas, bamboo briars, sarsaparilla, and gigantic grape-vines, rendered it necessary to bend down in the saddle in order to pass onward.

To my surprise, I noticed all this. For what purpose could she have chosen such a path? Was it indeed Isolina I had seen? A white horse and a scarlet manga are not uncommon things in Mexico. It might not be— But the hoof-print—

I dismounted and examined it: I knew it at a glance—it was that of the noble steed, and the rider could be no other than Isolina de Vargaa.

No longer in doubt, though still wondering, I followed the tracks. For a half mile or more, the path meandered through thick forest, here turning around some giant trunk, there diverging to the right or left, to avoid the impervious net-work of canes and lianas.

At length it began to slope upwards; and I perceived by the ascent that I was climbing a hill. The woods became more open as I advanced—here and there alternating with glades—the trees were of slenderer growth, and the foliage lighter and thinner. I was no longer among the heavy trunks of platanus and liquidambar. The *leguminosæ* were the prevailing trees; and many beautiful forms of inga, acacia, and mimosa, grew around. Myrtles, too, mingled their foliage with wild limes, their branches twined with flowering parasites, as the climbing *combretum*, with its long flame-like clusters, convolvuli, with large white blossoms, and the beautiful twin-leaved baubinia.

It was a wild garden of flowers—a shrubbery of nature's own planting. The eye, wandering through the vistas and glades, beheld almost every form of inflorescence. There were the trumpet-shaped bignonias—convolvuli in pendulous bells—syngenesiasts disposed in spreading umbels; and over them, closely set upon tall spikes, rose the showy blossoms of the bromelias—aloes and *dasylyrium*. Even from the tops of the highest trees hung gaudy catkins, wafted to and fro by the light breeze, mingling their sheen and their perfume with the floral *epiphytes* and parasites that clustered around the branches.

I could not help thinking that these flowers are gifted with life, and enjoy, during their short and transient existence, both pleasure and pain. The bright warm sun is their happiness, while the cold cloudy sky is the reflection of their misery.

As I rode onward, another reflection passed through my mind; it was caused by my perceiving that the atmosphere was charged with pleasant perfumes—literally loaded with fragrance. I perceived, moreover, that the same breeze carried upon its breath the sweet music of birds, whose notes sounded clear, soft, and harmonious.

What closet-slenderer hath asserted that the flowers of this fair land are devoid of fragrance—that its birds, though brightly plumed, are songless?

Ah, Monsieur Buffon! with all your eloquence, such presumptive assertion will one day strip you of

half your fame. You could never have approached within two hundred paces of a *Stanhopea*, of the *episcadum odoratum*, of the *datura grandiflora*, with its mantle of snow-white blossoms? You could never have passed near the pothos plant, the serberaea, and tabernamon tanææ, the callas, eugenias, ocotlas, and nictiginas?—you could never have ridden through a chapparal of acacias and mimosas—among orchids whose presence fills whole forests with fragrant aroma?

And more, Monsieur! you could never have listened to the incomparable melody of the mock-bird—the full, charming notes of the blue song-thrush—the sweet warbling voices of the silvias, finches, and tanagers, that not only adorn the American woods with their gorgeous colours, but make them vocal with never-ending song!

No, Monsieur; you could never have inhaled the perfume of these flowers, nor listened to the melody of these sweet songsters; and sad it was of you, and silly as sad, to have yielded to the prejudice of a slender spirit, and denied their existence. Both exist—the singing birds and the fragrant flowers—both exist, and thou art gone.

On such reflections I dwelt but for a moment; they were merely the natural impressions of surrounding objects—short-lived sensations, almost instantaneously passing away. The soul, benighted with love, had neither eye nor ear for aught beyond the object of its passion. From the contemplation of that only does it derive pleasure; and even the fairest pictures of nature may be spread before it without challenging observation. It was only that the one through which I was passing was of such transcendent beauty—so like to some scene of paradise—that I could not help regarding it with momentary admiration.

But my eyes soon returned to the earth, and once more taking up the trace of the steed, I rode on.

I had advanced near the summit. The tracks were quite recent; the branches that had been touched by the flanks of the horse had not yet ceased to vibrate; the rider could not be far in advance. I fancied I heard the hoof-stroke.

Silently I pressed on, expecting every moment to catch the gleam of the scarlet manga, or the white sheen of the steed. A few paces farther, and both were under my eyes, glittering through the feathery frondage of the mimosas. I had followed the true track. The rider was Isolina.

I saw that she had halted. She had reached the top of the hill, where the growth of timber ceased. An opening of about an acre there was, surrounded on all sides by the flowery woods—the very *beau-ideal* of a summer glade. The open summit commanded a view of the surrounding country—for the hill was a high one—while the charming spot itself enjoyed perfect privacy and repose.

In this glade, she had drawn up, and was sitting silently in the saddle as if to enjoy the warbling of birds, the hum of the bees, and the fragrance of flowers.

I myself drew rein, and remained for some moments in a state of hesitancy, as to whether I should ride forward or go back. A feeling of shame was upon me, and I believe I would have turned my horse and stolen gently away, but just then I saw the fair rider draw forth from her bosom something that glittered in the sun. It was a watch, and she appeared to note the time. I observed that she looked anxiously over the tops of the low trees, in the direction of the plain below.

These circumstances, trivial as they might appear, produced within me a quick sense of pain. I felt as if hot steel was passing through my heart. I had ridden to my ruin—I had followed to be present at an assignation. Thus only could I explain this solitary ride, and by such difficult and devious pathway thus only could I account for the oft-repeated anxious

ace, the ear acutely bent. Beyond a doubt, she listening for the footsteps of a lover!

The rein fell from my fingers. I sat irresolute—I really breathed—my heart felt cold and feeble—the

he mocked me—the parrots screeched his name—the in hoarse concert cried out ‘*Jurra!*’ The name nerved me, as blood knits the sinews of a tiger. Once more my fingers closed upon my die, my feet became firm in the stirrups, and heart and arm swelled to their full strength. ‘Twas but a bit rapier that hung against my thigh—no matter; might be no better weaponed; but even armed from head to heel, I feared him not. Three passions—red, jealousy, and revenge—supplied an arm of steel strength, and under the influence of these I felt bold and sure of conquest. Yes! I felt at that moment, as though I could have slain my hated rival with my naked hands.

I was no longer troubled with scruples of etiquette; this monster owed me satisfaction—life itself: he had striven to take mine; and now his should be forfeit to my vengeance. On that spot—even in her presence—should he die, or I myself become the victim. The two of us should never go thence alive. Ah, that he may reach the ground while my blood is as hot, and my hand ready!’

The fierce thoughts stirring within me must have used my horse, for at that moment he tossed his head and neighed wildly. A response came like an echo from the glades, and the instant after, a voice called out:

‘*Hola! quien va?*’

Concealment was no longer possible. I saw that I was observed; and, spurring my horse into the open ground, came face to face with Isolina.

THE MONTH:

SCIENCE AND ARTS.

OWTHSTANDING the reduction and economy which, the satisfaction of the nation, are now the order of the day, the government does not intend that science shall relapse into the same inefficient state in which it was found at the outbreak of the war with Russia. The Woolwich Committee, whose appointment for scientific purposes we noticed a year ago, is to be continued; the experiments with projectiles at Shoeburyness and other places are to be kept up with unrelaxed attention, though at less cost than heretofore. Less satisfactory to many is the announcement, that the plan of another expedition to make one more search for the long-lost Franklin party, is abandoned. The embarrassing question, who shall seek the seekers? comes, with every new proposal, more weighty. Private enterprise is now the only resource of those who hold another search to be an indispensable duty. That our consuls abroad ought to know something more than the mere routine of their duties, is a growing conviction. So much comes under their notice, which scientific knowledge would be of essential service, and so much is and has been lost for want of this knowledge, that an improvement in consular appointments may be looked for. The king of Siam, well-known in Europe for his love and patronage of science, wishes to have a British consul resident at his capital, and asks for a scientific man—one who may be able to do something in developing the resources of the country, and in giving a sound practical direction to its enterprise. Sir Robert Schomburgk—at present consul in San Domingo, where he finds too little to do, has been thought of for the post near his Siamese ally; and he is said, not without reason, to be the very man for the place.—Mr Newton, consul at Cos, in studying explorations of the island, discovered last

year an ancient, long-buried city, and sent home such representations as induced the Admiralty to send out the *Gorgon*, with materials and appliances for excavation. We have not yet heard the result.—The consul in Anatolia reports that great portion of the English sovereigns which flowed into that province during the war has been spent in cultivation. The country is fertile, producing abundance of corn and much cattle, and only wants good roads for further development; and these roads—seeing that British enterprise is now directed to Turkey—it is likely to have in good time. The produce of silk last year amounted to the value of L.400,000—a noteworthy fact, considering the enhanced price which silk has of late fetched in the market—and new spinning establishments, with improved reeling machinery, have been erected in the neighbourhood of Broussa. The Anatolian worms did not suffer from the malady which for some years past has well-nigh destroyed those of Europe, and numbers of their eggs have been sent to renew the weakened stocks of France and Italy.

Talking of able consuls reminds us of the *Blue-book* just published, containing a report on the examinations for the Civil Service. It appears that the whole number of candidates from May 1855 to December 1856, was 3004. Of these, 880 were rejected, 219 broke down under the examination, and a few others were too old, or unable to produce satisfactory evidence as to character. The commissioners think that, on the whole, the results are encouraging, notwithstanding the lamentable ignorance exhibited by many of the candidates. The blunders made in answering the simplest questions in history, and the wild mistakes in spelling would be ludicrous, did they not set one thinking as to what must have been the miserable incapacity of those who, but a very few years ago, obtained appointments before examinations were in fashion. Young men surely know whether they can spell well or not; and those who cannot, should at least make themselves perfect in orthography before they seek to enter the public service.

The amount of exports from the United Kingdom for 1856, is little less than wonderful—L.115,890,857, being L.20,202,772 more than in 1855.—The preliminaries for the great Euphrates Railway are growing more and more into a working form. An excellent sheltered bay for a harbour has been found near the mouth of the Orontes, in which a port and terminus are to be built. From thence the line will run to Killis, a town of 11,000 inhabitants—and onwards to Antioch and Aleppo. The latter, as is well known, is an important trading city, and we hear that its inhabitants petitioned to have the railway close to them. From Aleppo, the line will stretch parallel with the Euphrates to Ja' Ber castle, where it is proposed that the first section shall end, and from thence to Buzrah (the Bassora of the *Arabian Nights*), a name with which Mr Layard has made us all familiar. Here will be the starting-point of a branch to the capital of Persia, while the main line will continue across Beloochistan and to India by way of Hyderabad and the Deccan. It will be a triumph of enterprise when passengers can get into a train on the shore of the Mediterranean, and travel without a change of trains 3000 or 4000 miles to Calcutta. Whatever be the result of our negotiations with Persia, it is thought that we shall keep Bushire for the sake of permanent protection to the Gulf terminus of the railway.—There is talk, too, of a new railway in India, from Rajmahal to Darjeeling, some 300 miles, whereby an important section of the country will be opened up, and invalids will be able to travel quickly from the hot plains to the temperate climate of the hills.—And there is a scheme for a telegraph to India, to start from Cape Helle, across the Mediterranean, to Scio, Rhodes, and Alexandria, and follow

the railway to Suez. From thence, a submarine cable to be laid in lengths of about 500 miles to Kurrachee, the several lengths to terminate at stations along the coast, so as to obviate the expense and difficulty of repair, &c., of one long continuous line.—France is about to try what can be done in Algeria, Louis Napoleon having authorised Sir Morton Peto to survey for a hundred miles of railway, to commence at Constantine. Will this prove the beginning of a line which some day will reach to Timbuctoo, and the fertile regions of middle Africa discovered by Dr Livingstone?

Sir Henry Ward, governor of Ceylon, has visited certain remarkable ancient tanks still existing in that remarkable island. The workmanship, 1800 years old, is described as admirable. The Kandelly tank has an area of fifteen square miles in the wet season, and never less than three miles in the driest; but, from long neglect, it is in great part little better than a swamp. As the country all around is extremely fertile and lovely withal, a proposition has been made to colonise it, in which event the great tank would be restored to its original purpose of irrigation.—Slumbering Java is waking up: a telegraph is constructed from Batavia to Buitenzorg, and is to be extended to other places.—Australia is not asleep, for the colonists have now discovered that certain large patches of what they call 'black sand,' yield a better profit than gold. It consists chiefly of tin, with scattered grains of platinum, and lying on the surface, exacts no severe digging.—Another Australian topic is, that the settlers towards the interior have succeeded in some places in damming up the water of floods, and so keeping a supply for the dry season; and that where the waters have been thus retained, there has been a sensible diminution of heat, and in the violence of the scorching winds known on the spot as 'brickfielders.'

To glance at home matters: Professor Faraday has given a lecture at the Royal Institution on a deeply abstruse subject, including the phenomena of force and attraction, in which he puts forth explicitly certain views long entertained by him, and not unfrequently hinted at in his lectures. Some of these views are in direct opposition to those generally held by natural philosophers, and notably to the doctrine that 'attraction is inversely as the square of the distance.' As chroniclers of the progress of science, we content ourselves with recording the fact, leaving to a future opportunity a detailed exposition of it in a popular form.—A paper on the *Photography of the Moon*, by Mr Crookes, read before the Royal Society, makes another step towards the knowledge of the physical constitution of our satellite.—An important question, 'On the Various Methods of Indurating and Preserving Stonework,' has been considered and discussed by the Institute of British Architects, and with the effect of bringing out interesting and important facts. From these we learn that, however good may be the quality of building-stone, it is not proof against the destructive action of a London atmosphere. There are about 850,000 houses in the great metropolis, and from the chimneys of this vast number is sent forth a sulphurous acid gas, which, brought down by rain, produces most fatal results. The decay that has already taken place on the surface of Buckingham Palace, Bridgewater House, the Houses of Parliament, to say nothing of St Paul's and older buildings, would surprise those who have paid no attention to the subject. Among means of preservation, oily coatings and paint were shewn to be objectionable, though better than nothing, except in certain special preparations. Silicate of soda, as applied at Munich and Paris—as mentioned in a former *Month*—is one of the best preservatives. Another is, to cover this silicate with a coat of chloride of barium or calcium in solution, by which an insoluble

silicate of baryta or lime is deposited in the pores of the stone. Gas-tar dropped accidentally on Cass stone led to the discovery of a process of hardening which is carried on at Tonbridge Wells on a large scale. Blocks of soft sandstone, of any dimensions are worked to the required form, and in a few hours are rendered 'quite impervious to destructive weathering influence, also exceedingly hard and compact susceptible of a brilliant transparent polish, and of every desired colour.' Mr J. B. Daines said, that by subjecting one part (by weight) of sulphur and eight parts of linseed oil to a temperature between 225 and 278 degrees, he obtained a species of paint of singular preservative properties. Applied to the surface of building with a brush, it effectually keeps out air and moisture, prevents deposits of soot and dirt, preserves the beauty of the appearance of the stone, and, once applied, does not need to be repeated. 'All chemists agree that sulphur, the substance used to give body to the linseed oil, is unalterable in the air, and unaffected by moisture; if there is any change, it not only improves the colour of the stone to which it is applied as is shewn by the experiments in Old Palace Yard adjoining Victoria Tower, the statue of Captain Cook at the Foundling Hospital, and other places.'—Another solution, described by Mr Page, is potash and lime over which a coating of bees'-wax, softened by turpentine or naphtha, is to be applied. It has been tried on more than 400 works in the midland counties and at Liverpool, and with the result of shewing that walls with only one coat are as well preserved as those with a dozen. Part of a monument in Bilston churchyard, treated with this solution, has withstood the effects of a smoky atmosphere for seventeen years, while the parts left uncoated are 'in a state of rotteness, and falling away in every direction.'

Another subject brought before the Institute is that of metropolitan improvements. It is proposed to open a new street from Leicester Square, and from Tottenham Court Road, to Covent Garden and the Strand. This is a much needed improvement; and we hear that the Duke of Bedford has offered £15,000 towards carrying it out. Should the houses be built of stone, all the best hardening processes may be tried thereon. Another scheme is for an open road or quay along the south side of the river, and for a new street to connect the London Bridge termini with Westminster Bridge. It might help towards a satisfactory decision to refer to Mr Pennethorne's plan, published in 1864, 'for a line direct from Westminster Bridge to St George's Church in the Borough, and on through Bermondsey, which would then be opened up to general traffic.'

Among papers brought before the Institution of Civil Engineers, there are two worth a passing mention: 'On Varieties of Permanent Way,' and 'On Some Recent Improvements in Permanent Way.' In the reading of these, it was shewn that 'wooden keys are superior as fastenings to iron nuts and screws. The wood is elastic, and brings larger surfaces into contact.' 'A recent examination,' says the report, 'of some brackets and fish-plates, which had been laid down about twelve months, and were secured by bolts and nuts, shewed that in 125 pair of joints, each pair having eight bolts, 261 bolts were loose, and six were out altogether, although they had been tightened up within forty-eight hours.' Cast-iron sleepers are preferable in all respects to wood; and certain engineers considered it remarkable, 'that a country abounding in iron should annually expend hundreds of thousands of pounds in bringing timber from foreign countries, to lie and rot on the railways.' Many improvements are now in course of trial, and others are shewn to be at hand.—We may add to these observations on our own railways, that at the end of 1856, the extent of railways in the United States was 24,470 miles.

Dr Duchesne states, in a communication to the Academy of Sciences at Paris, that the engineers and kers on a railway improve in health and grow stout ring their first year or two of employment; but it afterwards a fatal change takes place. Among earliest unfavourable symptoms are, a weakening sight, loss of hearing, rheumatic pains, chiefly in the ht side, and a general sensation of numbness. These followed by pain and difficulty in standing, owing the violent tremor of the locomotive when in motion, ich makes it difficult to maintain an erect posture. Some remarkable facts come out of the French us for 1856, contrasting forcibly with the results of English census in 1851, or last year's *Report* of the gistrar-general. There had been, it appears, no real ease of the population since 1851; and there was a rked and constant influx of people from the country o towns, chiefly into Paris. Taking the years 1841 1846, the increase of population was 1,300,000; from 51 to 1856, it was only 256,000, and this disappears the sum-total when the mortality is taken into con- leration. From 1846 to 1851, the increase was 0,000: the decline is thus seen to be progressive: d by the side of this we find the numbers in the partment of the Seine increased by 300,000 in the at five years, in consequence of the migrations from e provinces to the capital. Fifty-four departments ew a decrease: one, the Haute Saône, has lost one- nth of its population, and others in nearly the same roportion. Grave matter here for professors of omical and social science to consider over.

M. Lallement, surgeon-dentist of Paris, has dis- vered a simple means of making an elastic and putrescible gelatine. He mixes glycerine in equal oportions by weight with strong glue melted in a ter-bath. Properly prepared, it serves admirably printers' rollers, for stamps, elastic toys, models r galvanoplasty, or for anatomical figures, artificial nbs, and so forth, to which the colour and suppleness the muscles and tendons may readily be given. ber applications will at once suggest themselves. is is not least important among the practical uses glycerine. M. Lallement suggests another. Dentists d it difficult to preserve natural teeth till oppor- nity occurs for fitting them in the mouths of ients. After a time, the teeth become brittle; but k them in glycerine, and their quality remains mpaired.

And now to conclude with a very different matter, James Matheson's doings in his Hebridean domain. e education of the female aborigines of the Lewis e on prosperously. Instead of forty or fifty little gged semi-savages attending occasionally at their n pleasure, there are now 120 regular scholars; clean d neatly clothed girls, of quite refined appearance, d much school-industry. This reform in externals, ich has been accomplished by Lady Matheson, isted by some ladies of Stornoway and the neigh- urhood, has given a new tone to peasant society the Ultima Thule; and cleanliness, neatness, and lace are the order of the day.

AN AUSTRALIAN MEG DODS.

us little time after the discovery of gold at Bendigo, mate and I, John Rawlings, moved over there from llarat, with the view of making our fortunes. We rived late one night in a little gully lately opened, ere we fixed our quarters in preference to the more ured spots. If there is gold there, we said to nelves, there is gold here; the only difference being at there it has been dug up, and here it hasn't. ach was our simple logic.

The following day was Sunday. It was a spring

morning, bright and warm; the air was full of insects newly sprung into life, and their drowsy hum seemed to tell of a day of rest. The bells of some bullocks on the hills sounded pleasantly in our ears, and reminded us of home. We could have fancied ourselves near some village church, and pictured in our minds the ivied tower, the green lanes, and the spruce congrega- tion on their way to prayer.

I was lying in the sun before our little tent, and Jack had just returned from a neighbouring store, where he had purchased a sheet of letter-paper and a large steel pen. He placed our largest shovel on the ground to serve as a desk, and having arranged his paper upon it, he attempted to write. He first assumed a sitting posture, which, however, he did not find to answer at all; then he knelt down, and after laboriously getting through about two lines, threw down the pen in despair; at last he lay down at full length, in a position not very elegant, nor, I should say, very comfortable, but in which he could keep his pen going. I observed him kicking his boots in the air occasion- ally, which, I suppose, he did when he was in want of an idea.

Presently a young fellow named Bruce, whose acquaintance we had made the night before, came up to talk over the news of the day. Observing Jack's singular position, he asked what he was doing.

Jack kicked up his boot, and said he was writing home. He regretted that the nibs of his pen were on bad terms, and would not keep together, and asked Bruce if there was any other pen in the neighbourhood.

'Why,' replied Bruce, 'if you would put your paper in your pocket, and go down to the Adelaide Coffee-house, you might have a table to write on properly.'

'The Adelaide Coffee-house!' exclaimed Jack, roll- ing himself over and sitting up. 'Where's that?'

'On the Bendigo. Our fellows often go there and have dinner, and read the newspaper.'

'Are you joking?' said Jack. 'Don't trifle with our feelings, my dear sir. Have a dinner and read the newspaper! I never heard of such a thing.'

'Oh, it's very true; and it's only half-a-crown for dinner.'

Jack was anxious to finish his letter, and he pro- posed that we should go and see these wonders, if Bruce would be our guide. He assented very readily, and after some delay occasioned by the exigencies of the toilet, we set off together.

Bruce's statement proved perfectly correct. The Adelaide Coffee-house did exist, and it was kept by Mrs Timmins. There was, indeed, a little man of quiet manners who occupied himself with digging, and who, I have heard say, was the husband of Mrs Tim- mins, but he evidently had no interest in the concern. Mrs Timmins was the proprietor, also the cook, waiter, and bar-maid. She was a fine, muscular woman, with severe, but handsome features, and a military air of command, which became her well. How shall I do justice to her admirable character? With untiring energy, working harder than any man that came to her dinners, she preserved order among the rough customers she met with, and kept her affairs in a perfect state of arrangement—with her accounts in her head, and her till in her pocket. Thoroughly honest herself, she would, as she said, stand no nonsense, and any attempt to impose upon her was sure to be detected at once. Humbug and dishonesty shrank abashed before her bright eye and downright tongue.

Such was Mrs Timmins. She, alas! has disappeared from the scene which she adorned, and the Adelaide Coffee-house has given place to more stately houses of entertainment, where you may get all the delicacies of the season as in the bill of fare. But the writer, who once enjoyed the acquaintance of that excellent woman, may be excused for paying his humble tribute

to her memory, and for dwelling with regret on the recollection of the day when he first introduced himself to her table through the medium of a half-crown.

The Adelaide Coffee-house stood opposite to the government camp, at the side of the principal thoroughfare. It was a long, low tent, rather black in colour, and beside it stood a little shed which was the kitchen of the establishment. The place had not a very attractive appearance, and the only lure spread out to entice the passer-by, was a dingy sign in front, on which the name of the coffee-house was painted in small and irregular characters.

When we entered after our walk, we found the place nearly empty, and Mrs Timmins was busily at work at the further end. She scrutinised our appearance, and then asked what we wanted. Bruce replied humbly, that, if it was convenient, we should like some dinner.

'Dinner!' she exclaimed; 'you're too late. There's no more dinner to-day for anybody.'

'Don't say that, ma'am,' said Jack pathetically: 'we have walked five miles on purpose to dine here, and we are desperately hungry.'

'Come, Mrs Timmins,' added Bruce; 'let us have some dinner to-day, and we'll come early next time.'

'Mind you do,' said she; 'for I shan't do it again for you, I can tell you. All you'll get now is a bone of beef, and if you don't like that, you must dine off the pickles.'

Mrs Timmins's pickles were a prominent feature in her *cuisine*, and were justly celebrated. She laid a very clean cloth on the end of the table, and produced the bone of beef, which proved to be a very respectable joint, excellently cooked. She then requested us to 'fall to' and help ourselves, for she wasn't going to leave washing her dishes to wait on anybody. We said we should be sorry to put her to that inconvenience, and Jack proceeded to carve.

'Is there any chance of potatoes, Bruce?' I inquired. 'Never mind them,' replied he. 'If we behave ourselves, and don't bother Mrs Timmins—she's rather out of sorts just now—perhaps we may get some pudding.'

'Pudding by all means,' said Jack. 'This beef is capital; brown outside, and tender within, like Mrs Timmins herself.'

'What's that you say about me, young man?' demanded the hostess from among the dishes.

'I was praising your beef, my dear madam; I never tasted better, I assure you.'

Mrs Timmins looked round with rather an offended air; evidently she was one of those strong-minded persons who are averse to flattery.

'None of your soft soap with me, young man. The dinner's good enough for you, anyhow.'

'Mrs Timmins,' said Bruce rather timidly, 'I hope you've got some pudding for us.'

'Pudding? Well, I'm sure! At this time of day, too! Not exactly.'

And she returned to her occupation.

'O come, Mrs Timmins! You know I am an old customer. You won't leave us with only half a dinner, I am sure,' continued Bruce; but his entreaties produced no effect whatever.

'Do you think she has any pudding?' asked Jack.

'My dear fellow, I never knew that woman to fail in her supplies. She has *always* got a pudding somewhere at the bottom of her pot.'

'She requires a great deal of persuasion,' remarked Jack. 'You must keep on talking to her, at all events. Put her in a passion, if necessary. I haven't dined.'

'Mrs Timmins, the beef is getting cold,' resumed Bruce.

'Let it!' replied the lady without turning her head.

'Confound it! what's to be done?' said Bruce despairingly.

'I have it!' exclaimed Jack suddenly, and he desired me to hand him my plate. I did so; and having carefully removed the fragments from it, he wiped the knife and fork, and arranged them before me as before dinner.

'I am sorry you have no pudding, ma'am,' said he 'for my friend here is a vegetarian, and will get no dinner.'

'A what?' inquired Mrs Timmins, coming up to

'A vegetarian, ma'am, from the neighbourhood of Bristol. He lives entirely on vegetables—though he wouldn't think it, to look at him—and can't eat meat at all. He could perhaps manage to eat a pudding; but as you haven't got any, he'll have to without his dinner.'

'Ah, you're a bad un!' said Mrs Timmins, shaking her finger at him.

'Ma'am!' exclaimed Jack, rather discomfited.

'You're a bad un! Do you think I ain't up to my tricks? Vegetarian, indeed! Now I'll tell you what I'll do: I'll give them two young men some pudding, but you shan't have a bit; and that'll teach you to come your nonsense over me next time.'

Jack looked the picture of despair.

'No, hang it, that's too bad, Mrs Timmins,' said he was able to say.

She disappeared from the tent without waiting to hear his remonstrances, and presently returned with a large fragment of plum-pudding, from which she cut two great slices.

'Turn your plate up,' said she to me.

'Do what, ma'am?' I inquired.

'Turn your plate bottom up, can't you, to put the pudding on.'

I did so, and she placed one of the slices before me, and the other before Bruce, wholly disregarding the appealing looks which Jack sent at her. The pudding was excellent. We sympathised heartily with our friend's unfortunate position, and told him so. He recovered his usual equanimity, and requested us to finish our dinner, and not exult over the misfortune of our fellow-creatures.

Presently Mrs Timmins quitted the tent for a moment, and by an unaccountable act of forgetfulness—or perhaps some relenting of her stern resolve—left the pudding on a table in the distance. Jack went up to it and cut a slice before she returned, when he swallowed furtively with an unmoved countenance.

Having purchased a bundle of Mrs Timmins's *Meg* cheroots, Jack occupied himself with finishing his letter, and Bruce and I read all through a copy of *Argus*, which was made up as usual of three pages of advertisements and one article against the tenant-governor. We then thanked our hostess for her good cheer, and took our departure. Jack bowed her a bow, and said that although she had refused her pudding—which he had no doubt was excellent—he was sufficiently compensated by the pleasure of making her acquaintance.

The severe countenance of Mrs Timmins relaxed into a smile, and she told him to be off with him—he had eaten more pudding than any of us. Did he think she didn't see him?

Jack expressed his opinion that she was the most impracticable woman he had ever met with. I scarcely say, however, that he did her injustice, when afterwards we learned of her acts of kindness rendered unsolicited to many a poor fellow stricken down by disease, even he came to respect the womanly qualities which lay hidden under the exterior of this Australian Meg Dods.

SATURDAY, APRIL 4, 1857.

PRICE 1½d.

THE WIFE OF THE PALATINATE.

ANY will remember a very affecting instance of conjugal devotion which was detailed in the newspapers of 1855. The heroine was the wife of a poor inn, who, having been dismissed from the Newcastle infirmary in cureless agony from chronic rheumatism, longed eagerly to get back to his native village. The only means of conveyance, however, he could afford—the common carrier's cart—was not to be thought of: it would have tortured him to death; and the devoted wife took her husband on her back, and carried him, over rugged country roads, full fifty miles.

This goes quite beyond the spasmodic strainings of romance; yet it is far outstripped by another instance of the heroism of conjugal love, equally well authenticated, although it occurred two centuries ago.

In the year 1621, at the commencement of the Thirty Years' War, the rich province of the Rhinepfaltz, or Palatinate, was overrun by Spanish troops, who with lawless licence plundered and destroyed wherever they came. The princely abbacy of Hirt, about two miles from Germersheim, on the Rhine, was one of the most desirable spots in the whole province, and its wide-spreading domain afforded occupation to a numerous staff of stewards, bailiffs, herds, ploughmen, and foresters. Twice a year the Pfaltzgraf, or Count Palatine, held court at Hirt, whither he repaired with his princess—Elizabeth, daughter of James I. of England—to enjoy deer-stalking in summer, and to hunt wild boars in winter. On St Peter's day each year, his head-steward or bailiff, a gentleman named Christopher Theim, rendered to the pfaltzgraf a statement of his accounts, which shewed a yearly return of many thousand rix-dollars. Herr Theim was married to an amiable lady, named Catharina Herpin, and was man of considerable wealth and property, possessing several estates at Neustadt, Wachenheim, Rockenhausen, and Hachdorff, besides houses and money. All the estates belonging to Herr Theim had embraced the Protestant faith, and consequently they, as well as the secularised abbacy of Hirt, did not fail to attract the rapacious eyes of the Spaniards, who ruthlessly claimed and seized whatever seemed desirable. They broke open cabinets and coffers, feasted on delicious dainties and rich wines, and, within a very few days, had rifled the whole place. To these outrages the steward opposed what resistance he could, considering, as in duty bound, to protect to the utmost of his power the property under his care. This being regarded by the lawless soldiery as an infringement of their rights, they seized him, and forced him to swallow a liquid

poured from a silver cup, which immediately paralysed his whole body. His muscular and robust frame became powerless; his sinews contracted so that he could not move a limb; he could not even stand without assistance, and his digestive organs became impaired.

Catharina Herpin, his wife, viewed his helpless state with dismay; but, apprehensive that something worse might befall, she determined to fly from the scene of danger. Secrecy was necessary to insure safety; the use of a carriage could not be obtained; and to add to her difficulty, she had two young daughters whom it was expedient to take with her. In these trying circumstances, Catharina resolved to depend solely on herself. She fastened her husband's powerless arms round her neck, and, with a little girl at each side, she hastened onwards towards the Rhine. A sympathising fisherman ferried her across the river, and on the opposite bank she entered the recesses of a forest, where she remained three days. At the end of that period, hunger compelled her to proceed, and with increased burdens and diminished strength, she slowly advanced by stages along the road. First carrying her helpless husband, in the same manner as before, some distance in advance, she set him down in an easy posture on a grassy bank by the wayside, and returned to bring her children. With one of these in her arms, and dragging the other wearily by her side, she traversed the same ground for the third time, till she reached the spot where she had left her husband; then changing her load, she advanced in the same painful manner another stage, and so continued till in a few days she arrived with her triple charge at the town of Rheinzabern, to the astonishment of the admiring populace. The sufferings and privations of the journey proved too much for the young girls: their piteous cries for food while on the road had been incessant, and had pierced their mother's heart with anguish; but a sharper thrust was in reserve for this courageous woman. Though received with kindness by the inhabitants, and provided with shelter and food, the children survived only two days, and then died in the arms of their mother. Public admiration having been excited, an allowance was granted to the family, which proved a valuable assistance; but the paralysis of Herr Theim's whole frame continued unalleviated. Every effort made to subdue it proved fruitless; and the only method by which nourishment could be administered to him, was to introduce it into his stomach through a quill.

The only effect that increasing trouble had on Catharina was to elevate her courage and intensify her devotion to her husband. Though unaccustomed

to bear the gaze of curiosity or the drudgery of burden, she overcame her natural repugnance to these, and determined to pursue her journey to Strasbourg, in the hope of enjoying better medical advice. She accordingly set out, with her helpless husband fastened on her back, and made her way—a distance of ten German, or forty-five English miles—to Strasbourg. On her arrival in that city, her case met with the same kind consideration and help as formerly; and her husband enjoyed the gratuitous advice of an eminent physician, who enjoyed a salary from the town. This doctor, after careful examination, pronounced the recovery of the invalid to be hopeless, unless he could be conveyed to the Swiss baths at Baden on the Aar. Nothing daunted by the length and difficulty of the route, this indefatigable woman at once determined to undertake the journey, and having again saddled herself, with her precious burden, she started on her wearisome pilgrimage. At each town through which she passed, she seems to have sought out some medical man, from whose advice she hoped to gain some useful or consolatory hint; and even in the face of bitter discouragement from some of these, she persevered. At Neuburg, thirty miles from Strasbourg, she consulted Dr John Melscher; and at Ensighheim, eighteen miles further on, she consulted the town doctor, both of whom affirmed that her husband's life would not last a week; but her hope was proof against despair; and with indomitable perseverance, she pressed on her way.

The old chronicle from which these particulars are drawn, enters minutely into the details of her progress. At Russach, ten miles further than Ensighheim, the household physician of the archbishop of Strasbourg again held out hopes of ultimate recovery, and confirmed the advice on which she had resolved to act, by pointing to the Swiss baths as the most likely means of improvement. At Gebweiler, ten miles further along the Rhine, an old physician was consulted, who also spoke favourably of the baths, but gave it as his opinion that, if they failed to effect a cure, sudden and speedy death would probably result. The next stage of Catharina's progress was across the river forty miles, to Freiburg, where she consulted the famous Dr Fedderer, and placed her husband under his treatment for eight weeks, but without any perceptible improvement. For eighteen weeks now, Herr Theim had been unable to receive any nourishment, except a little wine or soup introduced into his stomach through a quill, and nothing had been found which could afford him any relief. Before leaving Freiburg, however, a slight improvement was effected by means of a desperate kill-or-cure remedy, suggested by a brother-in-law of Dr Fedderer. But it was too slight to alter Catharina's resolution to carry her husband to the Swiss baths. Still forty miles further on, at Rheinfelden, she consulted two eminent practitioners, and was gratified to find, even on the borders of Switzerland, that the baths of that country were thought likely to be beneficial. With elated hopes, she persevered, and soon bore her beloved burden into Baden. Here she immediately began to apply the remedy she had come so far to seek; and for eleven weeks she carried her husband daily from their lodging down to the baths, and back again. The spectacle of a woman thus devotedly nursing her husband, and the report that she had in this manner carried him from the Palatinate, surrounded her with a halo of interest in the eyes of the inhabitants, many of whom paid her visits; and a few of the richer or more generous sent her presents, which she faithfully applied to help her husband's recovery. By slow degrees, he began to amend. In the course of a few weeks, he was so far improved that he could be fed with pap and other spoon-nourishment—the necessary diet being kindly supplied by the Princess of Furstenburg and another sympathising lady, both of whom frequented

the baths at the time. The next step in his improvement was the acquisition of sufficient strength to stand without support; but every attempt to walk without assistance, even with the aid of crutches, proved futile, as the want of muscular power in his hands prevented him closing them so as to hold anything. His body, however, continued to appear little more than a skeleton; and when in the bath, he floated on the water, as the old chronicler relates, like a piece of cork.

The expenses of their long journey, medical fees, medicines, and their living at the baths, soon exhausted what little money Catharina had scraped together from the bounty of friends or saved from the plunder of their property, and she was at length compelled to leave Baden. Allured by the fame of a Jewish doctor at Stanz, a town seventy miles distant, she bent her steps thither. On reaching the town, this physician, having his attention drawn to her, became interested in her case, and promised her relief for her husband. The prescription he gave her, and the manner in which it was acted upon, afford a striking illustration of the progress of the medical art in the seventeenth century, and the superstition which attached to it among the people. The doctor directed her to take a calf, and, having cut its throat, to preserve the *middle blood*. This, mixed with vinegar and salt to a consistency, she was to use as a liniment, and rub her husband's limbs with it daily for four weeks. He also gave her a small bag, containing a slip of paper inscribed with Hebrew characters, which the patient was to wear for a time round his neck. The good woman, fearing that the use of the first of these remedies might prove hurtful in some way to her faith as a Christian, resolved not to try it; but she carefully suspended the amulet from her husband's neck, and kept it there. Though, as the old record says, 'she in her simplicity rejected the most natural remedy to take the improbable one,' yet, probably, from the influence of former means, her husband in fourteen days had made some progress in his recovery.

From Stanz, Catharina continued her journey onwards to Ruppertschwyll. In order to reach this town, she had to climb two high mountains, named respectively the Sattel and Etzel mountains; and while passing the latter of these, an accident of an extremely dangerous character befell her. It was a long day's journey; and in order to reach Ruppertschwyll before nightfall, she started with her burden at five o'clock in the morning, and travelled almost the whole day without rest or refreshment. As she was descending the opposite side, she was seized with a fainting-fit at one of the steepest parts of the road, and falling, she rolled a considerable distance down the slope with her husband, sometimes uppermost and sometimes below her. She contrived at length to steady herself by grasping some bushes; and in this position she remained, till a good Samaritan, who was passing, came to her assistance, after having invoked the Holy Mother and Saint Anna. He first relieved Catharina from the danger of choking, by cutting the bands that fastened her husband's arms round her neck, and he then removed the patient to a more secure spot at a little distance, where he laid him in an easy posture to wait till his wife should be able to resume the journey. After a brief rest, she again took up her burden, and late at night arrived at the long narrow bridge, which all tourists must know who have visited the charming scenery of the neighbourhood; and reeling as she was from fatigue and exhaustion, she passed along its whole length—full two miles—without accident, though undefended by parapet or rail.

From Ruppertschwyll, the journey was continued through Herisau, the capital of Appenzell, to Constance, where medical advice and a curiously compounded bath effected no further improvement in Herr Theim's health. From Constance, the bandied pair bent

their steps towards Bavaria, through Ravensburg and Memingen—a route which, even at the present day, with all the appliances of modern travel, is wild and dreary enough. The object of their visit to Bavaria seems to have been to claim payment of a bond for 700 gulden (about £60), which a former duke of that country had granted in happier days to Theim's father. They found the representative of the debtor—Duke Maximilian, of Pfaltz Neuburg—at his residence Neuburg, on the Danube; and on presenting their demand, they were coolly told that the duke had not at that time sufficient money at his command, as he was engaged in building a convent for a company of Jesuits; but when that was finished, if he had enough left, he would then liquidate the bond. It is to be hoped, for the credit of humanity, that the princely debtor, when he gave this reply, knew nothing of the devotion of the woman whom he spurned; but the contrary seems probable, for the inhabitants of the ducal manor, on hearing that the pilgrim pair were sufferers for their Protestant faith, refused them even the common rites of hospitality.

At Augsburg, a Protestant town, sixty miles from Neuburg, a medical man of great celebrity again advised the baths at Baden, from which the first decided benefit had been derived, as likely to facilitate complete recovery; and, accordingly, the indefatigable Catharina turned to retrace her long painful journey through Swabia and Switzerland. On her way, after traversing about 140 miles, she consulted the headman or executioner of St Gall—a functionary both trusted and dreaded for his sympathetic cures—probably in the expectation of receiving some amulet or charm. He, however, prescribed bleeding; but as she regarded this as too severe a process in her husband's weak state, she declined to permit it. After a rest of three weeks, she pursued her toilsome way, over similar mountains to those which had formerly cost her so much trouble, to Zurich. At Schaffhausen, about thirty miles further, where there was a Protestant community, every house was gladly opened to receive and shelter a martyr to the faith. Cheered, and perhaps materially assisted, they pursued their way to Berne, and thence to the healing springs of Baden. Here at length, after a renewed course of bathing, the long-tried Theim found relief from his sufferings, and his affectionate wife enjoyed the reward of her toil in seeing her husband so far recovered that, with the support of a staff, he could walk alone.

Having recovered so far, he seems to have been unwilling to remain longer a burden on the charity of his Protestant friends, and therefore determined to seek out the pfaltzgraf, his master, in whose service he had suffered so much. The prince was living at this time at the Hague, in a state of dependence on the States-general of Holland; and accordingly the route of the affectionate couple lay through the entire breadth of Germany along the Rhine to Cologne, the whole of which distance they travelled on foot. From Cologne, they took a boat to Utrecht, whence the distance to the Hague was short. The result of their application to the pfaltzgraf is not stated: probably his allowance was barely enough for his own wants. At all events, we find our unfortunate pair shortly afterwards again travelling southwards. They had got as far as the fortress of Wesel, when, from some defect in their passports, they were turned back, and retired to Amsterdam. Here, under the best medical treatment, a complete cure was effected; and here, accordingly, the chronicler concludes his narrative. Some idea may be formed of the devotion and endurance of this courageous woman when it is stated, that she carried her husband on her back 172 German, or about 800 English miles, over hill and dale, across rivers, and through manifold dangers, and that their pilgrimages occupied a term of about three years, animated by

the one hope that his health might be restored. We do not know whether there is another instance of self-sacrifice and patient, untiring devotion on record that can compare with this; and we may add, that the history of their wanderings is said to be vouched by trustworthy evidence, and that the fact of their residence in Amsterdam in 1624 is clearly ascertained. At the peace of 1648, the pfaltzgraf was reinstated in his dominions, but we know not whether his faithful steward, with his tried spouse, ever returned to receive again his post and his property.

GLIMPSES OF AFFAIRS IN AMERICA.

FREE PEOPLE OF COLOUR.

WHILE in the slaveholding states, the free coloured people are subject to great injustice from the laws directly framed to oppress them, in the free states generally they have been persecuted by a cruel prejudice, that has not always allowed them to remain secure in life and limb. Their political and civil privileges differ in different states. The statute-books of Indiana and Illinois, both free states, are disgraced by a series of what are termed 'Black Laws;' the effect of which is to deprive the coloured man not only of all political privileges, but even to render his oath invalid. The state of Ohio has repealed her black laws only within the last few years, after a long agitation on the subject. Yet, the laws respecting the qualification of voters are not clearly defined, and, as a consequence, in the northern part of the state, where a strong anti-slavery feeling prevails, free men of colour are permitted to vote; but in the southern districts that border on the slave state of Kentucky, the reverse is the rule. In Iowa, Michigan, Pennsylvania, and Connecticut, whilst they are not personally oppressed by legislation, they are excluded from all political privileges. In the state of New York, they are entitled to vote at elections, provided they are possessed of real estate to the value of 250 dollars. Gerrit Smith, a well-known philanthropist and reformer, about six years ago, created in this state nearly one thousand voters of this class, by endowing them with property for the necessary qualification from his vast landed possessions. In all the New-England States, Connecticut excepted, the votes of free coloured persons are received on equal terms with those of the whites; and in Massachusetts, they are eligible to the highest offices in the gift of the commonwealth.

Nothing is more common in the northern states than to hear the free people of colour spoken of disparagingly, if not as a nuisance which the country would be gladly rid of. As is well known, the plan of expatriation was proposed, and has been partly carried out by the American Colonisation Society, the well-conducted settlement of Liberia on the coast of Africa being the result. The remarkable prosperity of that free republic, which is susceptible of immense increase, indicates, if nothing else did, that the world has laboured under some mistake about the mental qualities of negroes and mulattoes; and, on this account, the plantation of Liberia, apart from all considerations as to the motives of its projectors, must, I think, be accepted as a great fact—a fact in favour of negro improbability. But it is not necessary to go to Liberia in vindication of the character of this abused branch of the human race. That the progenitors of the present free coloured population of the northern states were degraded and ignorant, none will deny; but to say that their descendants, now in the third and fourth generation, are deserving of the same reputation, would be unjust and untrue. Should we grant that they are generally degraded, which we by no means admit, can those who are inclined to disparage and revile them, point to what has been

done towards their enlightenment and elevation? Far from assisting them on the road to honour and preferment, they have left no means untried to crush in them every noble aspiration, and to keep the whole population of every shade of black in a despicably mean position—exiled from all communion in joy, hope, sorrow.

The force and prevalence of this prejudice can scarcely be imagined by any one out of America. That the colour of a man's skin, without the slightest reference to his moral qualities, or even to his wealth, should determine his social or political position, savours of the ridiculous to Europeans. Yet such is the case in the United States. Nay more, even when all trace of the negro is lost by intermixture, and he no longer presents any distinction in features, the knowledge that he is of African ancestry, is sufficient to place him in the proscribed list; he is consigned beyond the possibility of extrication to the difficult position sustained by the free coloured people of the northern states.

The sufferings endured by this class, from 1835 to 1842, were of a shocking kind. It was no unusual occurrence for an inoffensive man of colour, particularly if he was decently dressed, to be publicly assaulted by white persons, for no cause whatever; and if his outcries attracted attention, no notice was taken when they were understood to come from 'only a nigger.' With the exception of a few abolitionists, the free coloured people had no friend; the evils of the agitation of the slave question at that period being unscrupulously visited on them. In scarcely any of the large cities of the North did they escape violence. Riots of the most frightful nature occurred in New York, Philadelphia, Boston, and Cincinnati. The dwellings of the coloured people were burned down, their furniture destroyed, and their lives were taken by the miscreants who were permitted to give unchecked rein to their hateful passions. In some instances, their churches were razed to the ground, as if it had been a crime for this unfortunate race to form part of a Christian community.

This storm of persecution having passed over, the free coloured population in the northern states gradually improved in public opinion. In some quarters, and among certain classes of whites, prejudice is as strong as ever; but on the whole, it has been greatly softened—a circumstance attributable not less to the general progress of enlightened sentiment, than to the feelings of compassion excited by the picturesque and affecting incidents in the lifelike narrations of Mrs Stowe. Yet, except in Massachusetts, these feelings do not go the length of doing complete justice to the people of colour. Though subject to a general school-rate, their children are not admitted to the higher kind of academies; the mere elements of education, at district coloured schools, being their full allowance. In the Sabbath schools, the same division is observable. St Andrew's Episcopal Church at Philadelphia has under its patronage and care a black as well as a white Sabbath school, in separate establishments. Once in each year, the children of both schools are brought into the church, that their progress may be ascertained. The white lambs of the flock are placed beside the pastor under the shadow of the pulpit, whilst the black sheep are stuck up in an obscure part of the organ loft. The whites are usually catechised in presence of the congregation, and the blacks are kindly permitted to sing a doxology while the congregation are dispersing.

The common practice of excluding coloured people from all but certain inferior classes of seats in the churches, is well known; and to such an extent has this been carried, that in most large towns they have established and support churches for themselves. In passing along the streets of New York on Sunday, you

see churches pouring out none but whites, and others none but people of various shades of colour, just as if there were a white and black Gospel. Only a few years ago, in one of the Presbyterian churches of New York, there were pews in the gallery marked B. M., signifying Black Members. An English clergyman on a visit to the States, who had heard of these proscribed seats, took an opportunity of testifying against such unchristian arrangements, by taking his family to this church, and seating himself in the midst of the B. M.s, to the astonishment and chagrin of the reverend gentleman who officiated, and the horror and disgust of the deacons, who were greatly scandalised by the stranger's want of self-respect. This quiet method of reproving the congregation of this church had the desired effect, and the B. M.s have since been removed. Negro pews are not now so fashionable as formerly; yet a coloured man would have to stand a long time in a genteel New York church before he would be offered a seat.

C. K. Whipple, in his able tract, entitled *Relations of Anti-slavery to Religion*, relates the following incident: 'In the year 1830, a coloured man bought and paid for a pew in Park Street Church, then and since the head-quarters of "orthodoxy" in Boston. He occupied it, with his family, a Sunday forenoon; but on returning in the afternoon, a constable, employed by the church committee, forcibly prevented his entrance; the Prudential Committee wrote him a prohibitory letter; and the church, in a church-meeting called thereafter for the express purpose, voted that he should not be allowed to occupy his own pew. They then proceeded to discuss, in five or six meetings following, each opened and closed with prayer, the most convenient and effective way of excluding the whole coloured race from equal participation in their worship. Finally, at the suggestion of one who bore, while he lived, the very highest reputation for piety in that church, a new pew-deed was framed, containing a provision enabling them to effect their purpose, and the pews of the church are still held under that deed. It has been so perfectly obvious that any similar attempt would meet the like result, that the trial has never been repeated in Boston. A Baptist church, however (Rev. Baron Stow's, in Rowe Street), has guarded itself against such attempts, by inserting in its pew-deeds the restriction that the pews shall be sold only to "respectable white persons." Whoever of that congregation is not a saint, can at least claim the credit of being a respectable white sinner.'

Notwithstanding these and all other indignities, it is an undoubted fact, that the free people of colour persevere in improving their circumstances, and in seizing on every possible advantage in the way of education. Still excluded from the colleges in New York or Philadelphia, coloured young men are admitted as a favour to some of the other northern colleges and higher order of academies on a footing of equality with whites. The consequence of this irrepressible desire for instruction is observable in the rise of coloured men in northern society; there being now in Boston coloured lawyers practising at the bar, coloured physicians, lecturers, and manufacturers. A prejudice, however, long outlives its expulsion from the minds of the more intelligent classes, of which we have till this day a lamentable example in the treatment of Jews in England. Educated, refined in sentiment, wealthy, admitted to the highest society, Jews are still excluded by technical forms from the House of Commons; and, time after time, the city of London returns a gentleman to parliament who is not allowed to take his seat, unless he make a declaration of a religious nature in violation of his conscience. So does prejudice operate in America. All are not to be blamed, because the free people of colour are subject to vulgar persecution. The prejudice against them

has not yet vanished from the minds of every variety of the 'snob' genus. By white workmen, who fear rivalry and contamination; by conceited parvenus, who dread a lowering of their dignity; by a miscellaneous body of hotel-keepers, railway-car conductors, managers of theatres, deacons of churches, and others who are alarmed for offending 'customers,' the repugnance to associate with, or to give house or seat room to coloured people, is still daily manifested. Public feeling on the subject seems to be in a transition state. A coloured person, in travelling, will sometimes be treated well, sometimes ill; sometimes insulted, sometimes passed over with indifference. The administration even of the law is modified by the feelings of its administrators.

Not long since, a coloured gentleman, a dealer in real estate, was compelled to ride in one of the negro-cars, although at the time he held stock in the company to the amount of ten thousand dollars. The ejection of a coloured lady and her infant from the cars in Massachusetts, created so much sympathy as to cause the passage of a law in that state, imposing a fine of six thousand dollars on any railway company or individual guilty of this offence in future. In the city of New York, suits have at various times been instituted against the proprietors of omnibuses and street railway-cars for the forcible ejection of coloured people. In one instance, judgment was given in favour of the plaintiff, and damages awarded to the amount of 250 dollars. But there is no dependence on these decisions. The case of the Rev. J. W. Pennington, a coloured preacher in New York, a most respectable and amiable person, who was well received in Europe, and holds the degree of Doctor of Divinity from the University of Heidelberg, deserves particular attention. Recently, he was expelled from a railway-car belonging to the Sixth Avenue Railway Company, and forthwith brought an action before the superior court of New York. Below, we give some notes of the proceedings in this curious affair, from the pages of the *European*, an independent New York newspaper.* It will be seen that the judge uttered some strange sentiments, and that the jury decided against Dr Pennington.

Mrs Webb, a coloured lady, apparently a quadroon, from the United States, has lately visited England on

an elocutionary tour. Accomplished in manners, well educated, and every way acceptable as a guest in the houses of people of distinction, this lady has become well known for her elegant readings of the works of popular writers. It gives one a curious idea of American notions on colour, to know that this ladylike person has been subject to indignities in different parts of the states, for no other reason than that she is not a pure white. She has mentioned to us, that in travelling through Pennsylvania, she was refused access to a railway-car, although she had purchased the appropriate ticket. On presenting herself for admission, the conductor put his arm across the door, to debar her entrance, and could not be induced to admit her. With much spirit, she stooped suddenly below his arm, and gaining an entrance, she pushed his arm down, to enable her husband to follow her into the car, where both received the congratulations of the passengers. The conductor was enraged, but, from the aspect of affairs, did not dare to expel them.

About a year ago, on visiting Boston, Mrs Webb went by recommendation to the Marlboro Hotel in that city. The Marlboro is known as 'the pious hotel.' It is an establishment celebrated for its religious usages—public prayers every morning, and a grace at every meal to which the guests assemble. Well, here, surely, she was safe? Quite the reverse. Mrs Webb was not allowed to attend prayers, nor to take her meals at the public tables, but compelled to remain in her own apartment. This was not all. The landlord had the meanness to charge the usual additional price for private meals, although remonstrated with, and shewn that her exclusion from the public rooms was his own act. Much to the credit of the press of Massachusetts, this abominable treatment was strongly condemned; and we can fancy that by the drilling on the occasion, the Marlboro's sense of religious consistency must have undergone some improvement.

In Massachusetts and some other free states, coloured persons are legally recognised as American citizens; but this is only a local advantage. As formerly mentioned, the federal government does not allow that they belong to the category of citizens. They are tolerated, and have a kind of protection; that is all. They will be given a pass, but not a passport. They are all of them 'niggers,' not Americans; and a few years ago it was no uncommon thing to hear an Irish or German immigrant, who had not been six months in the States, talk of sending the niggers out of the country, back to Africa, to which they belonged.

In the refusal of citizenship, the supreme government has forgotten the public services of the coloured race in the trying times of American history, when the clouds of adversity were most threatening. Answering to the call, blacks of every shade stood side by side with the whites in the revolutionary war. The first blood shed in the cause of American independence was that of Christopher Attocks, a mulatto, who was shot by British troops in the streets of Boston. In the swamps of the Carolinas, under the banners of Sumpter and Marion—with Lafayette at Yorktown, and with Washington at Valley Forge and Trenton—wherever the flag of the struggling Americans was unfurled, there might be found the negro cheerfully fighting for the national cause, for that liberty in which his descendants are denied to participate. Hundreds of coloured men, who are to-day deprived of all political privileges in the United States, can remember the scars displayed by their grandfathers—scars received in defence of a country which has not only bestowed on their children obloquy and the hardest bondage, but denies their right to call themselves Americans.

To resume a former comparison, the free coloured people inhabiting the United States have, like the down-trodden Hebrew race in England and other parts

* The counsel for the defendants contended that they were not bound to carry coloured people in all their cars. He referred to the constitution of the United States, to shew that there was a line of demarcation between the two races, and asked the jury if a coloured man would be permitted to sit at the public table of the St Nicholas, or any of our principal hotels. He also stated that the number of cars provided by the defendants for the coloured people was larger in proportion to the population than the number for white people. Judge Slosson, in charging the jury, spoke of this as a peculiarly difficult case; the chief point for consideration being, whether the business and interests of the company would suffer, from allowing blacks an equality as passengers with whites. The jury, after two hours' deliberation, found a verdict for the defendants. The *European* quotes the following opinion from the New York *Herald*: 'Upon this point our northern people are remarkably squeamish, while we know that all over the South it is quite a common thing to see master and mistress and slave, whites and blacks, occupying the same stage or car, without any symptom of a turned-up nose on account of the presence of Pomp or Dinah.' The *European* adds the remark: 'If no legal distinctions were made in the free states between white and coloured men, the prejudice against the latter would soon disappear (it has no existence in Europe), and they would be allowed by the whites to work along with them, learn trades, and become lawyers and physicians. They are now a persecuted race—reviled, too, on account of the direct and inevitable consequences of the bad treatment to which they are subjected. When sick, they must be doctored, if at all, by a white physician; when their property, their lives, liberties, or reputations are imperilled by judicial procedures, if they have any counsel at all, he must be a white man—for no coloured man is, in this city, allowed to become a physician or a lawyer. It is different, however, in Massachusetts. This brutal prejudice, which exists in no other country, is encouraged by the slave-owners for their own purposes. The enforced degradation of the coloured man of the North is used as an argument for keeping up slavery in the South.'

of Europe, thriven under adversity. As the Jews, by being excluded from the enjoyment of common political privileges, bestowed their whole energies on certain branches of trade, and thus accumulated immense wealth, so have the free coloured race—negroes, mulattoes, quadroons, and so forth—betaken themselves to such industrial courses as were left open to them, and in many instances with the most favourable results. Though contemned or neglected, they form among themselves social circles of no mean quality. They dress as well as their white compeers; and in point of manners there is nothing, as a general rule, to find fault with. At all events, we can testify that the more aspiring among them who have visited Great Britain, do no discredit to the land of their nativity, and are treated in every respect as if they could boast of a purely Anglo-Saxon origin. W. C.

HENDRIK CONSCIENCE.

OF all the minor European states, there is scarcely one that is more interesting to the observer than the kingdom of Belgium. Small as it is, it has, from the character of its people, acquired a respectability that is sadly wanting to other powers of greater political weight. In this little land, we see among the people a most enviable degree of material prosperity, while, at the same time, it enjoys an amount of liberty in its government that, except in our own country, is hardly to be found elsewhere in Europe. Nor is Belgium less interesting from its past history than from its present condition and prospects. Many of our readers have probably spent some little time in its old towns, and they cannot but remember the quaint buildings, the strange costumes, and curious usages they observed. Turn where the visitor will, he finds some object which at once carries back his mind some centuries, and compels him to think of the days when the merchants of Flanders were a power in Northern Europe, and the various guilds met and opposed, often successfully, the mailed chivalry of France. As he walks along, too, he sees inscriptions and hears words uttered in what appears to be a rude uncultivated *patois*, wanting alike the elegance of the French, and the masculine vigour of the German. Such a jargon, he perhaps thinks, cannot fairly be considered a language, and, to some extent, he is right. Until within the last few years, Flemish was in the position of a mere *patois*. Unlike its kindred Dutch, which has long boasted a respectable, though little-known literature, it was utterly uncultivated, and the only books printed in it were some few prayer-books, and those collections of tales, songs, and ballads which form the delight of the ruder part of every community. The educated classes spoke and thought in French, and Flemish was left to the smaller shopkeepers and to the peasantry. Something like a revolution has, however, begun. Some men of education have taken the despised dialect under their patronage, and now a Flemish movement is progressing in Belgium, one of the chief objects of which is the cultivation of what is the language of the great mass of the people of the country. We may perhaps be inclined to doubt how far it is expedient to attempt to give life and vigour to a language which is spoken by so small a part of the population of Europe, and which must ever, while it exists, form a barrier isolating the Flemings from their neighbours. Be this as it may, however, the movement is going on, and it is a strange fact that, when upon a recent occasion of national rejoicing in Belgium, prizes were offered for the best poems in French and Flemish, out of the innumerable compositions which were submitted to the judges, not one of those written in French could be considered as possessing even the moderate degree of merit which we presume is required upon occasions of the kind, while, on the other hand, several of the

Flemish compositions appeared to be deserving of honourable mention.

Among the promoters of this Flemish movement, Hendrik Conscience is certainly the best known, if not the only one at all known in England. Several of his novels and tales have been translated into our language, and have acquired a well-merited popularity. Who has not been delighted with the *Recruit* and with *Blind Rosa*? Which of our readers has not sympathised with the mental sufferings of the *Poor Nobleman*? We have all read *Vefa* and the *Miser*, and wondered over the strange tale of *Abulfaragus*; and the refrain of *Rikketikketak* is as familiar to our ears as any of the nursery-songs of our childhood.

Much of the popularity which has attended these tales is doubtless owing to the vividness of the descriptions of everyday Flemish life we find in them, and to the general truth of their colouring. We do not think our author can be looked upon as happy in his attempts at the regular historical romance; and the chief reason for the discrepancy between this and his less ambitious sketches is to be found in the fact, that in the one class of writings he has had nothing to guide him but his imagination and the lifeless records of old times, while for the other he has found a never-failing mine in his own experience. His life has been an eventful one; circumstances have driven him to mix with every class of his fellow-countrymen, from the highest to the humblest, and at times he seems to have been reduced to straits that remind us of what we read of in the literary history of England during the last century.

Hendrik Conscience was born at Antwerp in 1812. His father had served in the French marine at one time as a midshipman, and later as an *employé* in the docks at Antwerp. On the break-up of the first French empire, he settled in that city as a merchant. Our author's mother died before he had reached his seventh year; and thus from that period young Hendrik was chiefly left to himself, little, if at all, controlled by the authority of his surviving parent. Fortunately for him, part of his father's business consisted in the purchase of old books and papers; and thus the boy found the means of acquiring some knowledge. He read everything that came across him, and apparently the mass of books he thus indiscriminately devoured produced no evil effect upon his mind. Some years after his wife's death, the father, who seems to have been a man of a somewhat eccentric turn of mind, left Antwerp, bought some land in its neighbourhood, and built a sort of hermitage. There, while their father was attending to his business, and travelling through different parts of France and Belgium, Hendrik and a brother of his were left altogether to themselves. They never quitted the house and the garden which surrounded it. All the necessaries of life were brought in from the outside, and thus the two boys for some time led the lives of two hermits. After a period of some three years spent by them in this solitude, their father married a second time. But the strange education, or rather want of education, of the boys now began to exhibit the natural results. For years they had been to a great extent their own masters, and there had been no one to teach them the duty of obedience. The consequence was, that upon all possible occasions, they resisted the authority of their step-mother; and the disputes which arose in the family in consequence of this conduct, grew so bitter, that it was found necessary to remove the boys from their home; and they were accordingly sent to a school in Antwerp. At this establishment, Hendrik resolved to become a teacher, and to adopt that profession as his means of livelihood. All his studies were accordingly bent in that direction; and perhaps our author might at this moment be wasting away his life in teaching village-dunces the rudiments

of grammar, but for the great political events which at that period began to trouble Europe. The French Revolution of 1830 broke out, and was successful; and the Belgians, animated alike by national and religious feelings, determined to follow the example of their neighbours, and to shake off the Dutch yoke, which, since 1815, had pressed heavily upon their country. Conscience, like other young men, was fired with the enthusiasm of the time. He turned his back upon school and home, and took service in the Belgian army as a volunteer. He saw some sharp fighting during the years which ensued, but never rose in his regiment beyond the rank of serjeant-major. However, if he was unsuccessful in obtaining advancement in the profession into which he had so ardently thrown himself, he achieved some distinction in a different way. After the successful completion of the revolution, it seems that a considerable amount of discontent appeared in the ranks of the Belgian army. Conscience became the poet of his regiment, and it is stated that his verses contributed not a little to add fuel to the rising flame. Strange to say, these first literary essays of an author whose best fame has since been achieved by his Flemish writings, were in the French language. At that period of his life, however, Hendrik had the same contempt which was generally felt for the tongue of the great mass of his fellow-countrymen.

Shortly after this, the Belgian army was placed upon a new footing, and our author, with many others, obtained his discharge from the service. He spent some time vainly seeking for employment, and at length, as a last resource, determined to try his hand upon authorship. He wrote his first book, *The Year of Wonders*—a series of scenes from the days of the Spanish supremacy in the Netherlands. The work, like many other first works, was unsuccessful as a pecuniary speculation, although, in a literary point of view, it met with some appreciation in Belgium. When Hendrik came to settle his account with his publisher, he found himself deeply in debt. Something, however, must be done, if he wished to exist. His father, who had had several children by his second wife, could no longer support him, and Hendrik left his home once more—this time for ever. All he possessed in the world, when he took this decided step, was two francs, and a few clothes tied up in a handkerchief. With a heavy heart, and scarcely knowing what he should do, he bent his steps towards Antwerp. In this city, however, some little good-fortune was in store for him; and he there met an old school-fellow, who introduced him to his father. This gentleman took some interest in the poor fortune-seeker, and, at all events, secured him the necessities of life by providing unlimited credit for him at an inn. Wappers, the painter, also made his acquaintance, and became his friend, and even presented him to King Leopold. This presentation was well-nigh prevented by the very unromantic circumstance of our author's wardrobe being so scanty, that he had no clothes in which he could decently make his appearance before his sovereign. With Wappers' assistance, however, this difficulty was surmounted: the king received Conscience graciously, accepted a copy of *The Year of Wonders* from him, and afforded him some pecuniary assistance. Encouraged by this, Conscience now published a second work, which met with the same unfortunate fate as its predecessor; and a third, *The Lion of Flanders*, which cost its author fourteen months' labour, and brought him in the magnificent profit of six francs.

Conscience now found himself seriously embarrassed in consequence of the want of success of these publications. He began to think, also, that these repeated failures were proofs that he could not expect to earn a livelihood by the pursuits of literature. He therefore

came to the determination of henceforth earning his bread by the work of his hands; and he hired himself to a gardener as a common labourer. In this situation he spent thirteen months; but the close of his trials was at length at hand. His friend Wappers again came to his assistance, and once more called the attention of King Leopold to the struggling author. The result was, that Conscience obtained a place in the Academy of the Fine Arts at Antwerp, which secured him from all want. He now began that series of tales and sketches which have given him a European reputation. His works no longer meet with the fate of his earlier productions. They are sold and read, and have been translated into many languages. For several years, his life has been easy and happy. The author of *Flemish Interiors* informs us that Conscience is married, and the father of two sons. Thus, after all his struggles, we may presume that he is in the enjoyment of that comfort and domestic happiness, for the absence of which even the most widely spread literary fame can afford but a poor compensation.

N O. 19. W.

THERE has been a good deal of talk lately about model lodging-houses for the lower classes; but I think, for my part, charity should begin at home, and that we should first get model lodging-houses for ourselves. Why are there no respectable furnished apartments in the whole of London where Mr Poppet and I can afford to live upon our two or three hundred a year? One first-floor sitting-room, and two tolerably large bedrooms (on account of the nurse and baby), with cooking and attendance, is what we wish we may get for about L.7 a month in vain. Advertise? Well, we have advertised, and with great success, numerically speaking, indeed. 'All the comforts of a home,' 'cleanliness and attention,' 'no other lodgers in the house,' 'no extras,' 'a cabstand opposite,' 'the gratuitous use of a piano,' 'draught beer over the way'—every allurement, in short, that fancy could suggest to the designing mind, has been offered to us for the above price, and lower; but with what result? We have spent the money, and more than the money, I do believe, in removals and compensations for removal.

Once we thought we had obtained a certain status in society by taking apartments where there were 'two members of parliament on the second floor;' but these turned out to be Irish members, who occupied a double-bedded room immediately over our own chamber, and we had no rest for their Maynooth and similarly patriotic speeches for hours. 'Sir-r-r-r,' one would begin, 'I came down to this House to-night with no intention of addressing it; but the tants that have been levelled at my beloved country, the first gem of the urth and first flower in the say,' &c.: after which the other honourable member would 'follow,' as he expressed it, 'upon the same soide, in reply.' One little boy was retained all day in their sitting-room to take down their eloquence in shorthand; and 'hear, hear,' 'chair, chair,' 'order, order,' and 'Mister Spaker' resounded over us continuously until the two senators went down in an omnibus together to serve up their *réchauffés* to 'the House.' The dining-room had been seized upon by two clerks in the city, under pretence of its not being wanted—although they paid only five shillings a week apiece for sleeping accommodation—and the third floor was the residence of three, and the habitual resort of four other medical students. These never came in till two o'clock in the morning, when they would usually insist upon having some hot supper, and come to the door of our apartment to borrow forks and glasses. Moreover, the domestic being fast asleep in some unknown region, Mr Poppet had not seldom to go down and let

them in, because they had a habit of dropping their latch-keys into the letter-box in their endeavours to open the door. Lastly, in the attic of this house was a clergyman, who had resided there for fifteen months without offering any remuneration whatever to the landlady; he, however, gave but little trouble, she said, made his own bed, and lived exclusively upon rolls and Bologna sausages—still it was very annoying. The place, notwithstanding, was not, I believe, more unsatisfactory than others; certainly not so bad as our apartments in Porchester Oblong, for instance, where the landlord and his wife played cards all day, Sunday, being Jews, and their two female servants came up to me in a fainting condition, protesting that we did not leave enough provisions for their sustenance—they being made entirely dependent on the lodger for support. It was upon this occasion that Mr Poppet raised the standard of revolt. 'You have had the choosing of our place of abode for the last two years, my love,' he said, 'and I think I may say without contradiction, that you have chosen them excessively ill. No; I don't regard your going into hysterics in the least; all I have to observe is, that in future I choose the lodgings;' and he took his hat up and went out upon that errand at once. It is unnecessary to relate here how he pitched upon an *entresol* in the Regent's Quadrant, and paid two guineas deposit-money for the same, and never took me even to look at it after all, in consequence of communications he received from bachelor friends; or how he got a most excellent bargain of three sitting-rooms and as many bedrooms in Allsop Paragon, where the landlord wore a peacock's feather behind each of his ears, and went about the house crowing and flapping his arms: suffice it to say, that the residence Mr Poppet chose at last was No. 19. W.

It was situated in a pretty fashionable street, running directly into Hyde Park, where first-floor apartments were, upon the average, three guineas a week. The drawing-room and back drawing-room of No. 19 were elegantly and expensively furnished; the sleeping-rooms, though bare, were sufficiently large; and the rent was only two guineas. Everything, however, was excessively dirty, including Mrs A., the landlady. Her complexion was cream-colour, sprinkled with yellow spots; her hair, which should have been gray, was whitish-brown; and the hue of her gown quite indescribable: it neither reached high enough nor low enough, nor was it ever changed for another during our protracted residence in her apartments. My husband informed her that I was excessively particular about cleanliness, for which she expressed herself truly thankful; 'for, sir, I do assure you, with me it comes next to godliness;' and it may have done that, perhaps, in Mrs A.'s case, without inciting her to become of alabaster purity. She promised Mr Poppet to have a good wash out; each article of furniture should be accurately dusted, and everything made spick and span for our arrival. We called a week afterwards, and found seven days extra dirt upon No. 19 and its inhabitants, and were assured that the work of reformation was to be begun that afternoon. We called again next day, when Mrs A. immediately set to work to dust the knocker, as though that were the sole appurtenance to No. 19 still left unmirrorlike and spotless. When, after many injunctions on the one side, and promises on the other, we arrived at last with baggage and baby, as tenants, we found all things in primal chaos, with the kitchen-fire out, and no milk in the house for our beloved infant. Retreat, alas, was become impossible; and indeed we had cut it off ourselves by a remonstrance, ending with a policeman, with the cormorants in Porchester Oblong.

The domestic of No. 19 at that epoch—the first of eleven Marys who trusted for a greater or less time to the empty promises to pay of Mrs A.—was rather a

pretty young person, and a good deal cleaner than her mistress, but so hopelessly stupid, that upon being desired to fetch a cab for Mr Poppet precisely at 2 P.M., she brought up at that hour a pair of lighted candles, as though he were about to conjure, read Shakespeare publicly, or perform high-mass. It was her custom also to put letters intrusted to her for the post into any chink or box which offered itself out of doors, especially any that had *Letters* on it, in the simple faith that that was all Mr Rowland Hill required of her. There was also a Miss A., of ten years old or so, residing at No. 19 with her mamma; but she was a lily of the field, and toiled for nobody; nay, the one domestic was principally occupied in waiting upon her, in curling her hair, and getting her up generally, in order that she might apply herself, in correct drawing costume, to the piano. Yes, Miss Euphemia had a voice, as we well knew—was intended, as Mrs A. confided to me, for the Opera; 'my only objection being, ma'am, that I am told it is not a good profession for the soul.' Extreme simplicity, indeed, would seem to come next to cleanliness in the scale of this lady's virtues, and next to that, perhaps, truth. She would appeal to Heaven upon the very slightest provocation, to excuse her omission to make a pudding, or to account for the absence of sippets from a hash. All day long, we could hear her solemnly protesting to tradespeople and others at the door of No. 19, that she had not got one penny in the house, but that next week, as sure as there was a sun in the sky, their demands should be satisfied in full. She made no sort of difference in this formula, whether we had just settled with her for her week's account or not; and it is my firm belief that she never paid any one of them for anything. I had to go out for the barest necessities of life myself, not even the milkman consenting to send round to No. 19 without the express understanding that the provision was for the lodgers, and not for Mrs A. 'Why, ma'am,' said he, 'that 'ooman might have bathed in the milk I've sent her these last six months, without my seeing the colour of her money;' and certainly he could scarcely have selected a more awful image by which to have expressed his feelings. When, indeed, the claims of her landlord and her daughter's singing-master had been satisfied, I don't suppose that poor Mrs A. had really much money to spare, and, of course, under these circumstances, she could do no less than live upon us. She had taken No. 19 upon spec. of a gentleman (Mr B.), who rented it upon spec. of a certain lady (Mrs C.), who had furnished it upon spec., and never paid a shilling to the original proprietor (Mr D.), who had built the house upon spec., and was now at Boulogne. Neither A. nor B., nor C. nor D., had any money at all, I think, but were entirely dependent upon P. (the Poppets) for existence.

Mrs C. (who once called upon Mrs A. in company with a gentleman in a Hansom cab, with the hopeless intention of getting a five-pound note out of her), by whose elegant, and somewhat expensive taste the furniture had been chosen, had herself resided at No. 19 as long as she could get provisions upon credit, and had been succeeded by Mr D., who had done the same; so that not only was the bell of No. 19 a good deal pulled, and the knocker considerably worked—they came with a rap, but went away without one—but also, in the course of the four-and-twenty hours, expostulation, and even direct menace, floated up to the drawing-room floor in ceaseless waves. It may seem strange that we should have put up with inconvenience of this kind for a single week; but the fact was, that Mr Poppet and myself and the baby, had suffered such incredible things at the hands of lodging-house keepers, that we had fallen into a sort of torpor of despair. Therefore, although a good deal alarmed and frightened, I did not rush out of the

house at once, on the occasion when Mrs A. enticed me into her bedroom in the attics, and there exhibited a chestful of the most extraordinary and suspicious splendours—beautiful laces, heaps of cashmere shawls, necklaces of diamonds, jewels of every sort and kind, to be offered to me, as a valued friend, at what were certainly exceedingly low prices. She told me a strange story of her having once been lady's-maid to a person of fashion, and that confidence having been reposed in her by many females of high rank, they now intrusted her with these valuables to sell for them, they being more in want of the money than the goods, which, however, looked quite unworn and new. It was not a satisfactory account of the things, certainly; but a peril which befell our own goods and chattels about this time, drove Mrs A.'s secret treasure quite out of my recollection. This was no less than a menace on the part of Mr D. to put an execution into No. 19, unless his rent was paid. Mr B., it seems, had been trying the screw upon our spotted landlady with as little effect as Mrs C.'s mechanical endeavours had had upon him, for a considerable period; and the poor gentleman at Boulogne could make nothing out of his house whatever. We received this information from one of the many domestics whom Mrs A. had cajoled out of their gratuitous services; and it being further corroborated by the good lady's most solemn denial, I sent off Mr Poppet to see Mr D.'s lawyer in Bedford Row. My beloved husband is not very much used to business transactions, and he returned home, after some hours, in a most miserable condition. He had entirely failed in persuading the legal gentleman—who appears to have been rather deaf and excessively obstinate—that he was not B. or some other defaulter connected with No. 19. He said we could expect no mercy after such conduct as ours had been, and that nothing would be secured to us except our wearing apparel. I packed up what little plate we had at once, and took that and my dressing-case, with a moderator-lamp and a brand-new silk umbrella, to a friend's, for safety. When I had done that, and not before, I began to listen to Mrs A.'s expostulations upon the folly of apprehending such a thing as a distress-warrant in her house, when she had £500 worth of property under the bed in her room, let alone as much again behind the wainscot in the back dining-parlour. I am not sure, indeed, whether her riches or her poverty made us the most uncomfortable. In the daytime, the house was besieged by importunate creditors, and in the evening and late into the night, haunted by mustached gentlemen of foreign appearance, and very much shawled, who had, I suppose, jewellery business to transact with Mrs A. A magnificently attired lady of some fifty years of age having called upon one occasion, and had a most stormy interview, I animadverted, after her departure, upon the disturbance so respectable-looking a person had created.

'Lor, ma'am,' explained her opponent, 'how deceived you be, to be sure. Now, have you never heard, about twelve or one o'clock, a party a-singing and a-hollering up our street?'

'Yes,' said I, 'I have, and it's very disagreeable.'

'Well, ma'am, now, that party is the same party—the very same;' which information was accompanied by a telegraphic signal indicating that the party drank a little.

I began to feel very uncomfortable in No. 19 by this time; was convinced that people were about the house at night, and sent Mr Poppet out to look with a revolver, more than once, locking the bedroom door after him very carefully. He, however, manlike, having chosen the lodgings, determined upon the whole to like them; and I don't know but that we should have been there now, except for this.

One day we went out, baby and all, to dinner in the neighbourhood; and while we were enjoying that

repast in the parlour, our nursery-maid received a rather startling piece of information in the kitchen.

'A pretty house your master and mistress have got into at last!' observed the footman.

'Well, I don't know,' replied Sara, who is quite impervious to satire. 'I call it excessively dirty, at all events.'

'That ain't the worst,' said Thomas: '*it's the West End receiving-house for stolen goods!*'

Whether it really was so or not, or how Thomas got to know it, I can't tell; but by the next afternoon we had everything packed and in a cab for instant departure. Nobody had certainly entered the house that morning; but as I raised my eyes, by no means regretfully, to the first-floor windows, without doubt I saw a gentleman standing there, in our own drawing-room, with mustaches, of foreign appearance, and very much shawled. Mr Poppet wanted to run in again and demand an explanation; but 'no,' said I, 'certainly not. You're sure to see it all some day in the police reports; and nobody belonging to me shall ever cross the threshold of No. 19. W. again.'

THE CIVIL SERVICE.

In the days of the Regency, men had never heard the maxim that the right man should be put in the right place, and it does not strike us as at all out of character with the time, that Jekyll, the celebrated wit, when asked how it happened that he of all others was chosen to fill the responsible post of Master in Chancery, should have replied: 'Because he was the most unfit man in the country.' Since then, however, the public has grown more enlightened; and though, as we shall presently see, the schoolmaster is not everywhere abroad, at least in the sense which Lord Brougham intended when he first gave currency to the phrase, it is beginning to be thought that aspirants, even to government offices, should be to some extent possessed of the necessary qualifications for performing their daily routine of work with credit to themselves, and without bringing the public service into contempt. Mr Jekyll, it is true, got through his duties without any notable break-down. Lord Eldon, who had for a long time refused to make the appointment, but who was at length forced into it by the Prince Regent, used to say it was his very ignorance that saved him; had he only possessed that dangerous thing, a 'little learning,' he would probably have persisted in applying it without regard to consequences, but, as it was, he was forced to take the advice of his brother-masters, to whose superior knowledge he had sense enough to defer.

However unsatisfactory this way of getting through business may seem to common-sense people, it is pretty clear that it is still relied on both by candidates and by patrons to a startling extent. We do not know how matters stand at present with regard to Masters in Chancery or Lords of the Treasury; there is as yet, we believe, no examination for them to go through; but as regards the lower ranks, we have the best authority for what we say. The second Report of the Civil Service Commissioners is now before us, and the information it contains appears worthy of general and serious attention. It could hardly have been supposed, nor would it be easy to believe on any slight authority, that out of the entire number of persons who, having received nominations to government appointments between the 21st of May 1855, and the 31st of December 1856, were examined under the authority of the Civil

Service Commissioners, the number so examined, exclusive of competitions, being 2353, no less than 425 were rejected for egregious blunders in spelling alone, or for blunders in spelling combined with blunders in other subjects except arithmetic; that 147 were rejected for arithmetic, either alone or with other subjects except spelling; and 243 for spelling and arithmetic, with or without other subjects. It must be understood that in all these cases the gross ignorance of the candidates in either spelling or arithmetic, acquirements which do not seem to point to an unreasonably high standard, would have afforded a sufficient, or rather an imperative reason for rejection, even had they come up to the mark in other respects.

The total number of rejected candidates being 880, it will be seen, by adding the above numbers, that only 65 were turned back on other grounds, such as insufficient proof of character, not coming within the limits of age, or want of acquaintance with special subjects required in their departments. What appears particularly strange is, that the proportion of rejections increases. The number per cent. in 1855 was 29·5, and in 1856, 38·8. The Commissioners assure us that, as a general rule, their examinations have not in the slightest degree increased in stringency, so as to account for the increase, though they admit that to a small extent it may be ascribed to the undue strictness of provincial examiners, in the case of candidates for the office of expectant of excise. To prevent any possible occurrence of this kind in future, the Commissioners have arranged to send examination-papers from their own office, precisely similar to those used with candidates examined there, and the answers will be returned to them for adjudication, so that candidates examined in the provinces will stand in the same position as those examined in London.

It does not appear to us that any person holding a government situation, even in the subordinate ranks, can properly get through his duties if he is not well up in ordinary arithmetic, if he cannot read manuscript with tolerable correctness, or if his spelling is ludicrously bad. But we should not have felt so much surprise, nor would it have betrayed the existence of so low a standard in the Civil Service, had the rejections on these grounds been confined to such officers as tide-waiters, expectants of excise, letter-carriers, and messengers; but it appears from an appendix to the Report that no less than 198 of the higher class—that is, would-be clerks at Whitehall, at Somerset House, at the Post-office, in the War and other departments—were found grossly deficient in spelling. In transcribing the brief, and by no means difficult, orthographical paper set before these aspirants, sixteen made 16 mistakes; fifteen made 17 mistakes; thirteen made 18; eight made 19; eleven made 21; and the Commissioners kindly provide us with a table ascending in the scale of ignorance, which shews, among other high numbers, that three made 46 mistakes; two, 49; three, 54; one, 68; one, 75; while one gentleman, who was nominated to a clerkship in the Post-office, stands *facile princeps* at the head of all, being distinguished as the perpetrator of no less than 142 outrageous blunders! We can fancy his astonishment on discovering that the Commissioners declined to give him a certificate, for of course he was much too obtuse to discern his own shortcomings. He probably wrote

about his disaster to a former school-companion something after this fashion:

‘My dear Charls—I promised to wright and let you know when I wost fixed in the situtation were Mr Wiseacre our Parliament repreatative got me apointed a clarke, but now it his very diffirent intelligence I have to send, for I wost broght up before two gents who began to aske all manner of things and put me to wright down I don’t know how many answers. Yet would you supose it, after I answered all thier questions they refused to reecommend me. I was to had three long sums all full of farthings and I did them all, but I cant tell why the gent when he took the paper should have opened his eyes so very wide. Then I was to put down who defeated the Spannish Armada. Of course I could tell them it was Lord Marborough. I did not learn history for nothing at Mr Muddler’s as he knows well enough for he allways said I was a credit to his sistem. I told them all about gui Fawks and that Henry the Eight married Lady Jane Grey, and that the Roman walls in England were built to keep the Tartars out and that the battle of Culloden was fought between the Earl of Lester and Edward the Fourth. I wonder they did not aske the difference between the House of Lawds and the House of Piers, or who were the wigs and the Torgs, as though we where not polititions in our town as well as London.

‘They asked what was a cheif town on the Byne, so I told them Marselles as you may think. Then they broght a map of England whiout any place down on it, which I wost to fill up. Didn’t I do it like fun? The gent said I had done it upside down, but how could that be for I put in all the counties and their wasn’t any room left. They thought I dare say that I should be catched, but they were greedley mistaken. I am not so difficient as that comes to, but I know my suspision is write, that they were prepossessed, and jelous of what I new for fear I should take the shine out of thier own freinds. I supose they must want to keep the vacancy for some of ther own famely, but if they do it is a most purnitious and uncrapulus buisness. It would serve them just write to right to the Times and give them what they deserve for ther inflexible riggor, and that is to be made as exampel of. If you should see the paper at the Warrick Arms, just look out, for I’m detirmined to tell pepell what I did and how they served me, and if my letter dose not properley astonish pholisers, patroles, miniteress, and these gents too with there predudices and perfidity then I am not

Yours sincerely
GUSTAVIUS CÆSAR TUBBS.*

Some curious reflections are suggested by the case of our friend Tubbs, which gives something like an indication of the way in which government situations were formerly filled. There was little, or rather, in point of fact, nothing to prevent unqualified nominees in most cases from stepping quietly into their berths; but how in the name of wonder did public business get on with the Tubbes to take care of it? At least three clerks must have been required to do the work of two, besides an additional superior functionary to correct the blunders of his subordinates. We see, likewise, that the standard of education among the classes who look to mercantile and other situations for a maintenance, is far from what it should be; and that many young men of perhaps fair natural ability may be kept in the background all their lives, for want

* Although this is an imaginary letter, the blunders are really those made by the candidates.

of a tolerably sound school-training in their earlier years.

Arithmetic is another great point with the Commissioners, who say that they find no difficulty in ascertaining the fitness or unfitness of a candidate in this respect. Candidates for the lower offices, such as tide-waiter and letter-carrier, are expected to know the four ordinary rules, besides money, weights, and measures; but the examples set before them are of the simplest character, so that if they fail, it can only be by a most discreditable want of knowledge. 'In no case do the arithmetical questions which are required to be answered, even by candidates for the higher class of junior situations, reach beyond vulgar and decimal fractions, and it is our wish and intention that they should present to the candidate nothing of a puzzling character, but that they should be just sufficient to ascertain whether he understands the principle and is acquainted with the practice in the portion of arithmetic to which the questions belong.' Yet 390 candidates, during little more than a year and a half, were so deficient in this branch of education, that they would have been rejected on this ground alone, even though they had satisfied the examiners in other things.

The third great requirement of the Commissioners is good handwriting, and in this respect they repeat what they stated last year, that they very rarely find a candidate who comes up to their ideal of a good hand, and that, although they discern considerable improvement, they are still under the necessity of keeping the standard of handwriting low, especially as regards the inferior offices. Some departments, however, insist strongly on the importance of good writing, and on one occasion the Commissioners felt themselves bound to reject a candidate for a clerkship 'in an important department,' on account of bad handwriting, although he would otherwise have been successful.

It is only under peculiar circumstances, or in cases of extreme ignorance, that a candidate is rejected for want of knowledge in the higher branches of education. In English composition—meaning by that term, the ability to relate with fluency and distinctness some circumstance with which the writer is acquainted—the Commissioners have found themselves obliged to be extremely lenient. They say that, 'knowing the limited time and attention which is given to the acquirement of English composition in the schools of this country, we have considered that it is only especial ignorance displayed in this branch of examination which could justify us in treating it as a cause of rejection.' This is true to a serious extent: it may be doubted whether a dozen youths out of a hundred on leaving school, could accomplish an ordinary business-letter.

In history, which is one of the subjects intended to test the general education and intelligence of the candidate, the Commissioners have found it necessary to be very moderate in their demands. 'Some cases have occurred in which the display of almost total ignorance of history, combined with indifferent performance in some other subject or subjects, has led us to the conclusion of the candidate's unfitness. And there are also other cases in which a candidate would probably have been rejected in history, had not his case been decided on the ground of deficiency in the elementary subjects; but in no case whatever have we founded our rejection of a candidate upon history alone.'

In addition to the peculiar views of English history recorded in the epistle of our friend Tubbs, there are others not less remarkable to be met with in a note to the Commissioners' Report. Some of the candidates gave such answers as these—namely, That trials of ordeal were employed in the trial of Warren Hastings, and were legally prohibited in the reign of George I.; that George II. is the sovereign to whom the name of the English Justinian has been sometimes applied;

that 'William the Conqueror was a king who introduced many good laws into England; learning and all sorts of science flourishing under him;' that the great plot which was discovered in the year 1678 was the South-sea scheme; that William Wallace invaded England in the reign of Henry VIII.; that the battle of Marston Moor was fought between Bruce and Edward IV.; that in the Seven Years' War the Danes were opposed to the Britons in consequence of the massacre of the former, Sweyn gaining the victory, and being crowned king of England; that the Thirty Years' War was that between England and America; that the Scots were defeated at Bannockburn; and much more in the same style. Of geography, as little seems to be known as of history. The Alps are placed in Hungary, Swansea at Norwich, and Germany in the Caspian Sea. The Thames is made to rise in the German Ocean, and Zante is said to be the kingdom most recently added to Europe.

Notwithstanding all this, however, the Commissioners state—and in justice to those candidates who have been successful, it ought to be remembered, 'that great numbers of the candidates who have succeeded in obtaining certificates have passed very creditable examinations, and have shewn themselves thoroughly acquainted with the prescribed branches of knowledge. We believe, too, that we can safely assert that a larger proportion of persons have passed such creditable examinations during this year, than during the preceding period of our existence.'

We are rather sorry to find that the Commissioners continue to indicate a decided leaning in favour of the competitive system. In the case of a competitive examination for clerkships in their own department, they tell us, with evident satisfaction, that twenty-five out of forty-six candidates had finished their education at one or other of the universities, one having been a Cambridge wrangler; and that of the remainder, sixteen were educated at one or other of the great grammar-schools. As an exceptional thing, this sort of election may answer very well, and may do good service to young men of ability who lack interest to obtain an absolute nomination; but if the system were to become general, the result could obviously be no other than that of leading to a disproportionate expense in education, which, in the case of persons of limited means, would operate to the detriment of other members of the family. If competition were universal, it is clear that no one could rely on obtaining a situation of £100 a year if his friends had not been at a ruinous expense in maintaining him at college to learn things which, the examination once over, would make him no pecuniary return. It is not likely, however, that the competitive system will be extended greatly beyond its present limits, so that there is really nothing to restrict our satisfaction at the result of the Commissioners' labours. The public service can no longer be made contemptible by the intrusion of illiterate officials, and young men of tolerable ability and fair acquisitions will no longer find themselves thrown in the background by the school-dunce.

Parents and guardians may derive many useful hints from this Report; and schoolmasters will perhaps learn the propriety of giving their pupils a sound practical training in those departments which cannot be neglected without serious results. So large a proportion of the middle-classes looks to public and commercial appointments for a maintenance, that the means by which they may be honourably obtained are amongst the most important of social questions. Much vexation has, we doubt not, been caused where candidates have been rejected on the ground of ignorance, and many families have learned, when too late, that political interest without personal qualifications will no longer avail: but a great public good has been accomplished; and we hope that future aspirants will take the

warning which is so forcibly given by previous failures, and endeavour by home-studies to make up for any deficiencies in their school-learning.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XLVI.

A DECLARATION ON HORSEBACK.

FACE to face with my beautiful brunette. Her eyes fell upon me in an expression of surprise. I felt abashed by the glance; my conduct was not *en règle*. I bethought me of an apology. What excuse could I offer for such unceremonious intrusion? Accident? She would not believe it; the time and the place were against such a supposition. With an intellect like hers, it would be idle to adopt so shallow an artifice. No; I would not dissemble; I would boldly avow the truth. Jealousy had rendered me reckless of the result.

'*Adios, caballero!*' said she, interrupting my hurried reflections. '*Currambo!* where is your guide? How have you found this place?'

'Easily enough, señorita; I followed the tracks of your horse.'

'But so soon—I did not expect you'—

'No; you expected another?'

'Certainly. I thought Cyprio would arrive before you'—

'Cyprio!'

'Cyprio—yes, Cyprio.'

'Señorita! if this be another name for your Protean cousin, I have to say it will be better for him he should not arrive at all.'

'My cousin?—better not arrive? Holy Trinity, capitan! I do not comprehend you!'

Her large brown eyes were rolling in astonishment. I was as much puzzled as she, but I had begun my explanation, and was determined to carry it to the end.

'Then, Señorita de Vargas, I shall be more explicit. If Rafael Ijurra appear upon this ground, either he or I leaves it not alive. He has attempted my life, and I have vowed to take his, whenever and wherever I may meet him.'

'Pray heaven you may keep your vow!'

'Your cousin?'

'My cousin—Rafael Ijurra—my worst foe—the direst enemy of our house!'

'Ha! but were you not awaiting him?'

'Awaiting him! Ha, ha, ha! No. Little timid though I be, I should not desire to be here alone with Rafael Ijurra.'

'Lady! you astonish me; pray explain'—

'*Por dios!* gallant capitan, 'tis you who need explain. I sought this interview to thank you for your noble gift. You meet me with anger in your eye, and bitter words upon your tongue.'

'You sought this interview?—say you so, lady?'

'Certainly I did. For reasons already known to you, I dared not invite you to our house; so I have chosen this pretty glade for my drawing-room. How do you like it, caballero?'

'In your society, señorita, the rudest spot would appear a paradise.'

'Again the poet's tongue! Ah, capitan, remember the yellow domino! No more flattery, I pray; we are no longer *en masque*. Face to face, let us be candid with each other.'

'With all my heart I accept the conditions. Candour is the very thing I desire, for, to say the truth, I came prepared for a confession.'

'A confession!'

'Precisely so; but since you are an advocate of candour, may I first ask a question?'

'Ho! you wish to play the confessor with me?'

'I do, señorita.'

'Bravo, capitan! Proceed! I shall answer you in all sincerity.'

'Then, lady, what I would ask—Who is this Cyprio whom you expected?'

'Cyprio! Ha, ha, ha! Who should Cyprio be but my mozo; he who carried my message to you. Why do you put such a question?'

'He who carried your message to me?'

'Of course. Yonder is the *muchacho* himself. Hola, Cyprio! you may return to the house. *Currambo*, capitan! both he and you must have sped well. I did not expect you for half an hour; but you soldiers are soon in the saddle. So much the better, for it is getting late, and I have a great deal to say to you.'

A light had broken upon me. 'Twas Cyprio I had passed in the forest shade; the boy was the bearer of a message—hence his having hailed me. 'Twas I who was expected to keep the assignation; 'twas I whom the timepiece had been consulted—for when those earnest glances had been given! The bitter moments were past, and my heart swelled anew with proud and pleasant emotions.

As yet she knew not that I had come without invitation. Cyprio, at the word of command, had gone off without making any reply, and my prompt appearance upon the ground was left unexplained.

I was about to account for it, and offer some apology for my brusque behaviour, when I was challenged to the confession I had just promised.

Minor thoughts gave way before the important purpose I had formed, and to which the banter recalled me. So fair an opportunity might never offer again. In the vicissitudes of a soldier's life, the chance of to-day should not be disregarded—to-morrow may bring change either in the scene or the circumstances; and I was skilled enough in love-lore to know that an hour unimproved is often followed by an age of regrets.

But, in truth, I do some wrong to my character; was but little under the influence of such cunning calculation at that moment. I acted not by volition, but rather under pressure of a passion that held complete mastery over my will, and compelled me to the declaration I was about to make.

It was simple enough—three little words in either of the two sweet tongues in which we understood each other. I chose the one—of all others most attuned to the tones of the loving heart—and bending low to the fair face, and gazing into the liquid depths of the large inquiring eyes, I whispered the sweet, though oft-repeated phrase:

'*Yo te amo.*'

The words quivered upon my lips, but their effect proved the sincerity in which I had spoken. No doubt it was further manifest by the earnestness of my manner as I awaited her reply.

The habitual smile had departed from her lips: the damask red deepened and rose higher upon her cheek; the dark fringes drooped downward, and half-concealed the burning orbs beneath: the face of a gay girl had suddenly assumed the serious air of womanhood.

At first, I was terrified by the expression, and could scarcely control my dread; but I drew back from the flushed cheek, the roseate neck, the swelling panting bosom. Emotions were stirring in that breast. Oh, what emotions! will she not speak? Will she not declare them?

There was a long interval of silence—to me, seemed an age.

'Señor,' she said at length—'twas the first time I had heard that voice tremble—'Señor, you promise

to be candid; you have been so: are you equally sincere?'—

'I have spoken from the depth of my soul.'

The long lashes were raised, and the love-light gleamed from her liquid eyes; for a moment it burned steadily, bathing my heart as with balm. Heaven itself could not have shed a brighter beam upon my spirit.

All at once a smile played upon her features, in which I detected, or fancied so, the gay insouciance that springs from indifference. To me it was another moment of pain. She continued:

'And, pray, capitan, what would you have me do?'

I felt embarrassed, and replied not.

'Would you have me declare that I love you?'

'Oh! you cannot—you do not!'

'You have not asked the question!'

'No, lady. I dreaded the answer.'

'Ho! what a coward you have grown of late! A pity I am not masked. Shall I draw this veil? Ha, ha, ha!'

It was not the manner of love. Love laughs not. My heart was heavy; I made no reply, but with eyes upon the ground, sat in my saddle, feeling like one condemned.

For some moments her laughter rang in my ears, as I fancied, in mockery. The sweet silvery voice only grated upon my heart. Oh, that I had never listened to its siren tones!

I heard the hoof-stroke of her horse; and, looking up, saw that she was moving away from the spot. Was she going to leave me thus?

She spurred towards the centre of the glade, where the ground was higher, and there again pulled up.

'Come hither, caballero!' she cried, beckoning to me with her small gloved hand.

Mechanically, I rode up to the spot.

'So, gallant capitan! you who are brave enough to meet a score of foes, have not the courage to ask a woman if she loves you!'

A dismal smile was my only reply to this bitter badinage.

'Ah! capitan,' she continued, 'I will not believe it; ere now you have put that dreaded interrogatory—often, I fear too often.'

I looked at her with surprise. There was a touch of bitterness in the tone. The gay smile was gone; her eyelids drooped; her look was turned upon the ground.

Was this real, or only a seeming? the prelude to some abrupt antithesis? some fresh outburst of satire?

'Señorita!' said I, 'the hypothesis, whether true or false, can have but little interest for you.'

She answered me with a smile of strange intelligence. I fancied there was sadness in it. I fancied—

'We cannot recover the past,' said she, interrupting my thoughts; 'no, no, no! But for the present—say again—tell me again that you love me!'

'Love you!—yes, lady!'

'And I have your heart, your whole heart?'

'Never—can I love another!'

'Thanks! thanks!'

'No more than thanks, Isolina?'

For some moments she remained silent, her eyes averted from me; she appeared struggling with some emotion.

'Yes, more than thanks,' she replied at length; 'three things more—if they will suffice to prove my gratitude.'

'Name them!'

'Why should prudery tie my tongue? I promised to be candid. I too came here to make confession. Listen! Three things I have said. Look around you!—north, south, east, and west—the land you see is mine; be it yours, if you will.'

'Isolina!'

'This, too, can I bestow'—she held forth her little hand, which I clasped with fervid emotion.

'And the third?'

'The third, on second thoughts, I cannot give; 'tis yours already.'

'It is —?'

'*Mia corazon*' (My heart).

Those splendid steeds, like creatures of intelligence, appeared to understand what was said; they had gradually moved closer and closer, till their muzzles touched and their steel curbs rang together. At the last words, they came side by side, as if yoked in a chariot. It appeared delight to them to press their proud heaving flanks against each other, while their riders, closing in mutual clasp, leaned over and met their lips in that wild fervid kiss which forms the climax of love.

CHAPTER XLVII.

STRAYED FROM THE TRACK.

We parted upon the top of the hill; it was not prudent for us to be seen together. Isolina rode away first, leaving me in the glade. We bade adieu in that phrase of pleasant promise, '*hasta la mañana*' (until to-morrow). To-morrow we should meet again. To-morrow, and to-morrow, we should visit that sweet spot, repeat our burning words, renew our blissful vows.

I remained some minutes on the ground, now hallowed and holy. Within, the tumult of triumphant passion had passed, and was succeeded by the calm repose of perfect contentment. My heart's longings had been gratified; it had found all that it desired—even to the full reciprocity of its passion. What would it more? There is no more of mundane bliss. Life has no felicity to cope with requited love; it alone can give us a foretaste of future joys; by it only may we form some idea of the angel existence of heaven.

The world without was in harmony with the spirit within. The scene around me was rose-colour. The flowers appeared fresher in tint, and breathed a sweeter fragrance in the air; the hum of the homeward bee, laden with treasures for his love-queen, fell with a dreamy pleasance upon the ear; the voices of the birds sounded softer and more musical; even the *aras* and paroquets, chanting in a more subdued tone, no longer pronounced that hated name; and the tiny Mexican doves—*las palomitas*, scarcely so large as finches—walked with proud gait over the ground, or side by side upon the branches of the myrtled—like types of tender love—told their heart's tale in soft and amorous cooing.

Long could I have lingered by that consecrated spot, even *hasta la mañana*, but duty claimed me, and its calls must not be disregarded. Already the setting sun was flinging purple beams over the distant prairie; and, heading my horse down the hill, I once more plunged under the shadows of the mimosas.

Absorbed in my supreme happiness, I took no heed of aught else; I noticed neither track nor path.

Had I left my horse to himself, most likely he would have taken the right road; but in my reverie, perhaps I had mechanically dragged upon the rein, and turned him from it. Whether or not, after a lapse of time, I found myself in the midst of thick woods, with not the semblance of a trail to guide me; and I knew not whether I was riding in the right direction. I ought rather to say that I knew the contrary—else I should long since have reached the clearings around the village.

Without much reflection, I turned in a new direction, and rode for some time without striking a trail. This led me once more into doubt, and I made head back again, but still without success. I was in a forest-plain, but I could find no path leading anywhere; and amid the underwood of palmettoes I could not see any great distance around me. Beyond a question, I had strayed far out of my way.

At an early hour of the day, this would have given me little concern; but the sun had now set, and already, under the shadow of the moss-covered trees, it was nearly dark. Night would be down in a few minutes, and in all probability I should be obliged to spend it in the forest—by no means an agreeable prospect, and the less so that I was thinly clad and hungry. True, I might pass some hours in sweet reflection upon the pleasant incident of the day—I might dream rosy dreams—but, alas! the soul is sadly under the influence of the body; the spiritual must ever yield to the physical, and even love itself becomes a victim to the vulgar appetite of hunger.

I began to fear that, after all, I should have but a sorry night of it. I should be too hungry to think; too cold either to sleep or dream; besides, I was likely to get wet to the shirt: the rain had commenced falling in large heavy drops.

After another unsuccessful effort to strike a trail, I pulled up and sat listening. My eyes would no longer avail me; perhaps my ears might do better service.

And so it chanced. The report of a rifle reached them, apparently fired some hundred yards off in the woods.

Considering that I was upon hostile ground, such a sound might have caused me alarm; but I knew from the sharp whip-like crack that the piece was a hunter's rifle, and no Mexican ever handled a gun of that kind. Moreover, I had heard, closely following upon the shot, a dull concussion, as of some heavy body dropped from a high elevation to the ground. I was hunter enough to know the signification of this sound. It was the game—bird or beast—that had fallen to the bullet.

An American must have fired that shot; but who? There were only three or four of the rangers who carried the hunter-rifle—a very different weapon from the 'regulation' piece—old backwoodsmen who had been indulged in their whim. It might be one of these.

Without hesitation, I headed my horse for the spot, and rode as rapidly as the underwood would permit me. I certainly must have passed the place where the shot had been fired, and yet I saw no one; but just as I was about to pull up again, a well-known voice reached me from behind with the words:

'Jumpin' Geeshosophat! it ur the young fellur!'

Turning, I beheld my trapper comrades just emerging from the bushes, where they had cautiously *cached* on hearing the hoof-strokes of my horse.

Rube carried upon his shoulders a large turkey gobbler—the game I had heard drop—while upon Garey's back I observed the choice portions of a deer.

'You have been foraging to some advantage,' I remarked as they came up.

'Yes, capt'n,' replied Garey, 'we won't want for rashuns. Not but that your rangers offered us a plenty to eat; but ye see we couldn't in honour accept o' it, for we promised to find for ourselves.'

'Ye-es, durn it!' added Rube, 'we're free mountaineer men—ain't a gwine to sponge on nobody—we ain't.'

'An, capt'n,' continued Garey, 'thar don't appear to be any great eatin' fixins about the place for yerself neyther: if yu'll just accept o' the turkey, an one o' these hyar quarters o' the deer-meat, thar's plenty left for Rube an me; ain't thar, Rube?'

'Gobs!' was the laconic answer.

I was not loath to satisfy the wish of the hunters—for to say the truth, the village larder had no such delicacies as either wild turkey or venison—and having signified my assent, we all three moved away from the spot. With the trappers for my guides, I should soon get into the right road. They, too, were on their return to the post. They had been in the woods

since noon. They were both afoot, having left their horses at the rancheria.

After winding about half a mile among the trees we came out upon a narrow road; here my companions, who were unacquainted with the neighbourhood, were at fault as well as myself; they knew not which direction to take. It was dark as pitch, but, on the night before, there was lightning at intervals. Unlike the preceding night, however, it was now raining as if all the sluices of the sky had been opened; and by this time we were all three of us soaking wet. The whole canopy of heaven was shrouded in black, without a single streak of light upon it—even a star. Who could discover the direction in such a night?

As the lightning flashed, I saw Rube bending down over the road; he appeared to be examining the tracks. I noticed that there were wheel-tracks—deep ruts—evidently made by the rude block-wheels of a *carreta*. It was these that the trapper was scanning.

Almost as soon as a man could have read the direction from a finger-post, Rube raised himself erect, and crying out:

'All right—this-away!' set off along the road.

I was curious to know how he had determined the point, and questioned him.

'Wal, yur see, young fellur, it ur the trail o' a Mex kin cart; an anybody as iver seed thet ur vamin knows it hez got only two wheels. But thur are four tracks hyur, an thurfor the cart must a gone back o' fo'th, for I seed they wur the same set o' wheels. Now 'tur raizonable to s'pose thet the back-track leads to the settlements, an thet's this-away.'

'But how could you tell which was the back track?'

'Wagh! thet ur easy as fallin off a log. The back track ur the fresher by more'n a kuppel o' hours.'

Pondering upon the singular 'instinct' that enabled our guide to distinguish the tracks, I rode on in silence.

Shortly after, I again heard the voice of Rube, who was some paces in the advance.

'I kud a knowd the way,' he said, 'ithout the whe tracks: they only made things more sartint sure.'

'How?' I asked. 'What other clue had you?'

'The water,' replied he; 'ee see, or 'ee mout, ef yu a looked into the tracks, thet it ur runnin this-away. Do-ee hear thet thur?'

I listened. I heard distinctly the sound of running water, as of a small stream carried down a rocky channel.

'Yes—I hear it.'

'Wal,' continued the trapper, 'it ur a branch made by the rain: we're a follerin it down; an thurfor we kum to the river jest whur we want to git. Once thur, we'll soon find our way, I reck'n. Wagh! the durned rain kums down! It 'ud drown a muskrat! Wagh!'

The result proved the trapper's reasoning correct. The road-water was running in the direction we had taken; and shortly after, the brawling branch shot off from among the bushes, and crossed our path, directing from it at an acute angle. We could see, however, as we plunged through the now swollen streamlet, the current, in its general direction, was the same as our road: it would certainly guide us to the river.

It did so. Half a mile further on we came out upon its banks, and struck the main road leading to the rancheria.

A few minutes' brisk travelling carried us to the outskirts of the village, when we were all three brought to a sudden halt by the sharp hail of the sentry, who called out the usual interrogatory:

'Who goes there?'

'Friends!' I replied; 'tis you, Quackenboss!' had recognised the voice of the soldier-botanist, and

under the lightning, saw him standing by the trunk of a tree.

'Halt! Give the countersign!' was the response in a firm determined tone.

I did not know this masonic pass-word. On riding out, I had not thought of such a thing, and I began to anticipate some trouble. I resolved, however, to make trial of the sentry.

'I haven't got the countersign. 'Tis I, Quackenboss. I am'—

I announced my name and rank.

'Don't care for all that!' was the somewhat surly rejoinder; 'can't pass 'thout the countersign.'

'Yer durned fool! it's yur captin,' cried Rube, in a peevish tone.

'May be,' replied the imperturbable sentry; 'can't let him pass 'thout countersign.'

I now saw that we were in a real dilemma.

'Send for the corporal of the guard, or either of the lieutenants,' I suggested, thinking that that might be the shortest way to get out of it.

'Hain't got nobody to send,' came the gruff voice of Quackenboss from out the darkness.

'I'll go!' promptly answered Garey—the big trapper thinking, in his innocence, there could be no reason why he should not carry the message to quarters—and as he spoke, he made a step or two forward in the direction of the sentinel.

'Halt there!' thundered the voice of Quackenboss; 'halt! another step, and I'll plug you with a bullet.'

'What's thet? plug he sez?' screamed Rube, leaping to the front. 'Geeho Geehosopah! yu'll plug 'im, eh? Yur durned mulehead, if 'ee shoot this way, it'll be the last time yu'll ever lay claws to a trigger. Now then!' and Rube stood with his rifle half raised to the level, and threatening to raise it still higher.

At that moment, the lightning gleamed; I saw the sentry with his piece also at a level. I well knew the accuracy of his aim; I trembled for the result. In my loudest voice, I called out:

'Hold, Quackenboss! hold your fire! we shall wait till some one comes; and as I spoke, I caught both my companions, and drew them back.

Whether it was the commanding tone of my voice, which the ranger had heard before, or whether in the light he had recognised my features, I saw him, before it darkened, lower his piece, and I felt easy again.

But he still obstinately refused to let us pass. Further parley was to no purpose, and only led to an exchange of rather rough compliments between Quackenboss and my two companions; so, after endeavouring to make peace between them, I stood still to await the chance of some one of the guard coming within hail.

Fortunately, at that moment, a ranger, somewhat the worse for aguardiente, appeared in the direction of the piazza.

Quackenboss condescended to call him up; and after a crooked palaver, he was despatched to bring the corporal of the guard.

The arrival of the latter ended our troubles, and we were permitted to reach the piazza without further hindrance; but as we passed the stern sentry, I could hear Rube mutter to him: 'Ee durned mulehead! if I hed ye out upon the parairas, wudn't I? Wagh!'

CHAPTER XLVIII.

AN ADIOS.

To-morrow, and to-morrow, and to-morrow—a deline of love, whose every hour was consecrated to its god. At earliest dawn, by the rosy rays of Aurora; at golden noon, shadowed under sweet acacias; in the gleam of the purple twilight; 'neath the silvery light of the moon.

That both laid our hearts upon his altar, and willing

knelt before the shrine, witness ye bright birds and balmy flowers!—ye green myrtles and mimosas!—witness ye blue skies of Anahuac! Ye alone were our witnesses.

For you who have loved, I need not portray the pleasure of this noble passion; for you who have not loved, I cannot. Love is a delight that may be known only to those who have experienced it.

Ours was a half-month of happiness without alloy. True, there were moments of pain—the moments of daily parting—but these were brief, and perhaps only prevented the cloyment of too much joy—if such a thing be possible. Moreover, these short-lived sorrows were in part neutralised by the knowledge we should soon meet again; we never parted without exchanging that fair promise. In the morning, it was '*hasta la tarde*;' at night, our last words were '*mañana por la mañana*.' Lovers have felt, and poets have sung, the pleasures of hope; oft the anticipation of a pleasure rivals in piquancy its actual enjoyment.

Let memory not be forgotten; it, too, has its joys; and oh, how sweet the retrospect of those blissful hours! If there was monotony, it was a monotone of which my heart could never tire. It was an intoxication I could have endured for life. There is no surfeit of such sweets. Why are we not permitted to enjoy them for ever? Alas! there is an ending.

There was so. A crisis came, and we must part—not with the pretty promise upon our lips—'until the morning,' 'until the evening,' but for long weeks, months, may be years—an uncertain time—'*hasta se acabo la guerra*' (until the war is over).

Oh, the misery of that parting! Cruel destiny of war! Never felt I so weary of wearing a sword.

There was a struggle 'twixt love and duty. No, not duty: I might have sheathed my sword, and wronged no one; I was but a cipher among thousands, whose blade would scarcely have been missed. Nor would I have wronged myself. I was simply, as I have already declared, an adventurer. The country for which I fought could not claim me; I was bound by no political conscience, no patriotic *esprit*. Perhaps, now and then, I entertained the idea that I was aiding the designs of 'manifest destiny'—that I was doing God's work in battling against the despotic form. Yes, I may confess that such sparks glowed within me at intervals, and at such intervals only did I feel enthusiasm in the cause. But it was no consideration of this kind that hindered me from deserting my banner. Far otherwise: I was influenced by a motive purely selfish—pride.

I could not—not an adventurer almost penniless—I would not presume to claim that richly dowered hand. Fortune I might never have to equal hers, but fame is worthy wealth, and glory mates with beauty. I knew that I was gifted with an apt head and bold aspiring heart; I knew that I carried a keen blade, and hoped to hew my way to rank and fame. Perhaps I might return with a star upon my shoulder, and a better handle to my name, and then—

Ah, for all that, it was a bitter parting! It was hard to list unheeding to those earnest entreaties, adjuring me to stay—terrible to untwine those tender arms—terrible to utter that last *adios*!

Our troth was plighted within that same glade that had echoed our first vows. It had been plighted a hundred times, but never sadly as now, amidst sobs and tears. When the bright form, screened by the frondage, had passed out of sight, I felt as if the sun had become suddenly eclipsed. * * *

I lingered not long, though I could have stayed for hours upon the hallowed spot. Again duty, that stern commander, summoned me away. It was already close upon sunset, and by to-morrow's dawn I must be *en route* with my troop.

I was about heading my horse into the track, now

well known to me; Isolina had gone down the hill on the opposite side, by a path that led more directly to the hacienda. From precaution, this had been our habitual mode of parting; and we also met from opposite sides. In the wild region of the *cerro*—for by this name was the hill known—we never encountered a human being. There was no habitation near, and the *vagueros* rarely strayed that way, so that our place of meeting remained a secret—at least we fancied so—and we acted without much apprehension, and perhaps without sufficient caution. Each hour we had grown more confident of security, and, blinded by love, had taken less pains to conceal the fact of our daily assignation. It was only that morning I had heard a whisper that our affair was known, and that they of the *rancheria* were not as benighted as we supposed them. Wheatley was my informant—Conchita, his. The lieutenant had added some friendly advice, cautioning me against the imprudence of going so far from the post unattended.

Perhaps I might have treated his remonstrance with less neglect; but as this was to be our last meeting for a long time, my heart grew heavy under the prospect of the parting scene. I preferred going companionless; I had no apprehension that any enemy was near. As for Ijurra, he was no longer in the neighbourhood; he had not been seen since the night of the battle, and we had positive information that he had joined his band with the guerrilla of the celebrated Canales, then operating on the road between Camargo and Monterey. Indeed, had Ijurra been near, he could hardly have escaped the keen search of Holingsworth and the rangers, who, night and day, had been upon the scout, in hopes of overhauling him.

I was about turning into the old track, when a yearning came over me—a desire to obtain one more look at my beloved. By this time she would have reached her home; I should pass near the house; perhaps I might see her upon the *azotea*—a distant glance—a wave of the hand—haply the sweet prayer, '*va con Dios*!' wafted upon the breeze: something of the kind I anticipated.

My horse seemed to divine my wishes; scarcely waiting for the guidance of the rein, he moved forward upon the path taken by the steed of Isolina.

I soon reached the bottom of the hill, and, entering the heavy timber, traversed a tangled wood—similar to that on the other side of the *cerro*. There was no path, but the tracks of the white steed were easily followed, and, guiding myself by them, I rode forward.

I had not gone five hundred yards from the hill, when I heard voices echoing through the woods, directly in front of me, and apparently at no great distance. Years of frontier-life had imbued me with an intuitive caution that resembled instinct; and as if by a mechanical effort, I pulled up and listened.

A woman was speaking; and instantly I recognised the voice. There was but one that rang with that rich metallic tone. I might well remember it, for the sweet, sad sounds of the *va con Dios* had not yet ceased to vibrate in my ears.

With whom was she in converse? Whom had she encountered in such a place, amid the wild woods?

She ceased speaking. With ears keenly set, I listened for the rejoinder. Naturally, I expected it in the voice of a man; but not that man. O heavens! it was the voice of Rafael Ijurra!

'COPYING BY LIGHT.'

Many of our correspondents having been unsuccessful in their trials of this process, we now give some further particulars, which they will find of great assistance:—The months of November, December, January, and February are not favourable for copying prints, the sunlight being too weak. Under most states of sunlight in this

country, instead of a *quarter of an hour*, which would be sufficient under very favourable circumstances, the paper may be exposed even to four hours. After the paper has been spread over with the solution, it is to be dried in the dark, say in a drawer or dark room: if dried in the light, it will be useless. One of the greatest difficulties is keeping the paper, on which the solution has been spread, in perfect contact with the picture: where it is not in contact, the copy will be very indistinct. The solution of blue-stone and bichromate of potass must be well shaken before being used. The prepared paper will remain fit for use for a long period, if kept in the dark; but it is most sensitive when fresh. The strength of the solution of common salt should be at least thirteen grains to the ounce of water. The print should remain in the solution of common salt until it begins to turn of a yellowish colour.

THE MOHAMMEDAN LADY TO HER HAND-MAIDEN.

BY CALDER CAMPBELL.

Bring out the mats beneath the trees
Whose boughs are bright with scented gold;
And spread the softest cushions where
The shade is deepest, and the air
Comes coolest through the white-starred fold
Of jasmynes, welcoming the breeze.

Bring out the lute, whose sound He loves
To mingle with his own sweet song;
Which hath indeed but one rich theme,
Love—a reality, no dream—
A sparkling rosebud twined among
Life's common paths, wherein he roves.

Bring sherbets of the rarest taste,
Where lime and almond flavours blend;
And fruits, so full of juice, the sight
Shall quench his thirst with strange delight—
As dews that with the sun descend
Refresh and soothe the sultry night.

Pomegranates, crimson with ripe blood;
Grapes, purple as the wood-dove's wings;
Guavas, pink and white, whose smell
The palm-tree paroquet loves well;
And mangoes, whose aroma brings
Dreams of his northern fir-cone wood.

Bring flowers—those roses of the east
Whose tiniest buds are drenched with scent;
And Moogra chaplets, white as snow—
And the sweet myrrhy buds that glow
On the wood-apple,* 'neath whose tent
The sportive monkey makes its feast.

The air is rich, that soon shall be
Much richer by His fragrant breath;
Fan me with scented grass, bedewed
With cooling essence—for my blood
Hopes fevers, and the *kuskus** hath
A soothing influence on me

'Tis twilight, for a fire-fly gleams
Amid the yellow citrons there:
A footstep falls upon my ear,
Whose music tells me He is near.—
Ah me! this world is very fair,
And sweet are young Love's waking dreams!

* The blossoms, leaves, and fruit of the *Feronia elephantum*, or wood-apple, have a rich odour, not unlike myrrh. The roots of the *kuskus*-grass, of which mats, screens, and large fans are twisted, when sprinkled with water, give out a spicy and refreshing smell. It is the *vitiver* of modern perfumery.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 171.

SATURDAY, APRIL 11, 1857.

PRICE 1½d.

SHOP-WINDOWS.

To the opinion of the philosopher who held the shady side of Pall Mall to be the spot on earth most replete with enjoyment, I have but one difficulty in subscribing. On the shady side of Pall Mall there are no shop-windows; and to the real epicurean of the joys of sauntering in metropolitan shade, there can be no happiness on the cool side of any street where shop-windows are not. I am aware that there are men, professors in the delights of idling, to whom the mere pacing to and fro is sufficient, and in whose eyes shop-windows are no more than margins of the footway on the one side, as the kerb-stone is on the other. I am a saunterer of more enlightened creed; and if an Arab by reason of my wanderings, I am at least of the tribe recognised among that ancient people as the 'dwellers in cities;' and my nomadism is limited to the regions civilised by shop-windows. What music is to the banquet—supplying an under-current of harmony that links one enjoyment to the other, and to the patchwork of an entertainment gives coherency and concord—shop-windows are to the peripatetic philosopher. When thought begins but for an instant to stagnate, and the stream of reflection to flow less freely, the next shop-window will furnish fresh matter for our musings, cheer us by the exhibition of some of the pleasant varieties of life, if we are meditating too moodily, or bring us down to the sobering level of reality if our fancy is indulging in too fantastic a flight.

Let who will decry my philosophy as of the shop, shoppy, I care not! I give them their mountains and their valleys, their rivers and their plains, their magnificent prospects and flourishes anent the picturesque, so they let me have the shops; for what are to them empty shops, are to me galleries of art, science, and marvels, and treasures of never-failing enjoyment; exhibitions where there is no fee for admission, where you are constrained to purchase nor catalogue nor programme of the entertainment, where there are no reserved seats and no fees to attendants. Pass with a glance, or linger for prolonged inspection, you incur neither liability nor obligation; and should you, on these unexpensive terms derive, in any measure, amusement at the moment, or material for after-thought, how deep should be your gratitude to the donors of the benefaction!

What a joy is a print-shop—a Walhalla of the hour! The popular voice delivers its verdict on public men, through the media of lithography and engraving. It is merely a question of supply and demand, just as a mother wants a photograph of

'baby,' so does the public demand the face of its favourite: the print-seller is not behind hand, and soon there is the Abon Hassan of the day, the king for the hour, in all the glories of graving, occupying the post of honour in the print shop-window. But there are more heroes for the day than heroes for all time: there is a 'latest novelty' in reputation as in everything else; and at the back of the shop we are peering into, lie a ghastly assortment of celebrities who have been pushed off or have shrunk down from their pedestals before the rival who now reigns in their stead! What bargains might one now secure in enlightened statesmen, who have waned into insignificant M.P.s; accomplished orators, who have shrunk into empty talkers; popular preachers, who have merged in mere bishops; fascinating actresses, whose charms have passed their climacteric; and dashing cavalry-officers, who have been found, on to-day's reflection over the premature verdict of yesterday, to be but heroes of a most Brummagem mint. Truly said George Villiers, Duke of Buckingham: 'We can no more judge of the value of a man by the impression he makes on the public, than we can tell whether the seal was of gold or brass by which the stamp was made. Nevertheless, let us sun ourselves in the light of the countenance of the present hero, and while we bend reverently before his worship, muse how long his reign will last, and speculate upon the heir-apparent to his throne.'

What museums of marvels are pawnbrokers' shops! What a halo of wonderment, half smiling, half sad, consecrates each of the curiosities which, in the shape of unredeemed pledges, illustrate the window. Into what a sea of conjecture do we not drift. Who was the ill-fated proprietor of that handsome cruet-stand, 25s., and what was the untimely occasion that compelled its mortgage? Who was it purchased temporary alleviation of his impecuniosity by 'putting away' that solid silver soup-ladle, 18s. 6d.? Who were the primal possessors of the curved Damascus dagger with jewelled handle; of the antique pistols richly inlaid, which I would not for a trifle undertake to fire off; of the plated chamber-candlestick, very coppery about the edges, and thus fully complying with the provisions of the old law, which required all plated goods to exhibit somewhere the original foundation? Whose heart was eased by the deposit of the bronze head of Cicero, strikingly like Mr Pitt, and a good deal battered as to features? That strange oil-painting, too, in splintered and dirty frame, of a tawny orange-coloured saint, sitting in outer darkness, visited in his opacity by a scarcely less tawny-coloured nymph, with the little wardrobe she has, clothing the air considerably more

than herself, descending from sea-green clouds, and presenting to the virtuous ancient in the foreground what seems intended for a bird, a dove perhaps, though very much like a cottage-loaf in shape; the whole ticketed to be by Julio Romano—very fine work, only L.3, 10s. By what combination of circumstances were all these strange and incongruous effects drawn together into the net of the pawnbroker? Did the original owners deposit there their chattels, with the intention of redeeming them at a future period; and did stern poverty, most implacable of creditors, lodge more and more detainers against them, until at last the arrangement was foreclosed, and the equity of redemption lost altogether? How many paid interest on the advance, and so staved off for a time the day of reckoning, which came at last notwithstanding, and engulfed deposit, interest, and all? What have become of the duplicates? Are they destroyed, or held still as faint representatives of treasures once possessed, though now lost for ever—title-deeds of a past prosperity, like the genealogy of a poor peer, or the heavy schedule of a bankrupt trader? What a crowd of shipwrecks, what 'seas of troubles' must there have been to strand upon the same shore such different cargoes! The India-shawl, the clock, the toast-rack, the eye-glass, the bracelets, the thermometer, the umbrella, the flat-iron, the chimney ornaments, the teapot, the opera-glass, the Soutley medal, the wedding-ring, the spurs, the freemason's insignia, the gold-watch, engine-turned, and jewelled in four holes, and last, melancholy item! the small silver-gilt locket, in which a plait of light-brown hair is still nestling. Melancholy token! Love himself—it can only be a love-gift—the prisoner of the pawnbroker!

But this is sad; let us 'move on.' What a haven for half-an-hour's loitering is the bookstall!—half-way house between the publisher and the buttermilk-morgue for the disposition of defunct literature, in case some friendly hand may charitably claim the sad remains for private interment, and so rescue them from the ignominy of dissection at the cheese-shop. 'Paint an inch thick, to this complexion must we come at last.' All these at fourpence: *Cassivelaunus*, a Tragedy, in five acts; *Sturm's Reflections*; *The Soul's Vigil*, and other Poems; *Watt's Logic*; and vol. ii. of the *Rightful Heir*, a novel, in three volumes (Newman: Leadenhall Street). *The Whole Duty of Man* for fourpence, the *Clergyman's Vade-Mecum* for three-pence, *Paley* for ninepence, and *Pope's Homer* for a shilling. 'How the knave jowls them to the ground.' Did these books cost no more the making but to play at loggats with them? Let the man who desires to write a book, visit first a bookstall, see what he can buy for sixpence, and then go home and not write it.

News-venders have cheerful shop-windows. There we find exhibited that interesting illustration—on the first page of the cheap periodical, which always seems to be published in advance of its date—to which I never could find the relative letterpress. There are hung up the newspaper placards: 'Horrible Murder at Horsleydown;' 'Homes and Altars, by Gracchus;' 'Curious Case of Breach of Promise;' 'Helotry in High Places;' 'Bishops and Bigamy;' Theatricals, and all the News of the Week. There are the etchings of the new monthly serial; there the vast wood-cuts of the illustrated newspaper; and there a miraculous draught of shilling light literature, in rainbow covers, demonstrating, alas! too frequently, that lightness is not synonymous with brightness after all, and that there may be flame without, although there be no fire within.

Then there are bonnet-shops!

There is something about bonnets so peculiarly suggestive of the married state, that a steady inspection of them by any one on the hither side of the rubicon of matrimony, seems to be almost a certain token of

an approaching change of condition; and a bachelor of autumnal age curiously scrutinising the contents of a bonnet-shop becomes a spectacle of serious import. I must admit both my autumny and unmarried status, and yet braving all the imputations and remonstrances the admission may call down upon me, avow myself a devotee of bonnet-shops. I speak of the exterior only. The interior—*procul este profani*—is one of those arcana with which we cannot be perfectly acquainted until we have emerged from the novitiate of bachelorhood, and become priests in full orders of the temple of Hymen. Such glimpses behind the veil as we may have caught before arriving at that full-blown condition, can have been secured only by stealth or accident. A forlorn commission, having reference to a hideous fabric something of the hue and shape of a copper coal-skuttle, with a bird of paradise of fierce aspect and many colours perched on the top—the bonnet of an elderly maiden-aunt in the country—afforded me the only experience I ever enjoyed of the interior of a bonnet-shop. But of bonnet-shop-windows I profess myself an amateur. To me those fancy filmy elegances—I am not speaking of ancient ladies' bonnets now—those corner-stones in the edifices of a pretty woman's toilet, possess an infinity of attractions, and, as it appears to me, appeal even more to male than to female admiration. I can conceive a woman considering a bonnet very much as an anatomist might regard a woman. He would mutter: 'Bone, muscle, vesicles, chyle, &c.; a very nice subject.' She would eye the bonnet with an unpleasantly analytical glance, and murmur: 'Moiré, lilies, lace, guipure, &c.; a sweet bonnet.' They both know too much to admire boundlessly; they are so clever they become critical, and lose the faculty of blind admiration. Man, by the very plenitude of his ignorance, enjoys a fuller gift of appreciation. He can regard the bonnet only as something beyond the grasp of his understanding, and to be admired in proportion to the impossibility of comprehending it: as a feather in the air, gone up out of reach; as a substance, if substance it is, vapoury, dreamy, gauzy, in the nature of foliage, which seems to halo round a pretty face, and endow it with multiplied prettiness. So have I, at least, looked at bonnets in shop-windows, and wondered and admired.

There is one bonnet-shop that lives particularly in my memory. It was situated in a populous thoroughfare, dedicated to my forenoon saunter; and it must not be permitted to prejudice my enthusiasm in the cause of bonnets if I concede that the hour when the window was being decked by the fair hands of its attendants was the period I generally selected for my visit to it. It seemed to be a time of high festival when the profane eye of the uninitiated might snatch the privilege of a glance at the eleusinianism of bonnetdom, and see at once both cause and effect, the bonnets and their makers. The ceremony of the arrangement of the window was of an important and protracted nature; and I must own my stay in the neighbourhood while it was going on was continuous. I believe that, from considerations of propriety, I maintained a sort of delusion that I was waiting for some mythical omnibus that never made its appearance. This was but clumsy drapery over my so frequent presence, and shrouded its real motives very ineffectually; but gradually, by use and the pacific character of my proceedings, it came to be accepted as sufficient; and I was at length acquiesced in as a morning visitor who might watch without accusation of rudeness though the omnibus came never so tardily, or came not at all.

One fair item in the group, seen each morning decking the window, as of old the Graces attired Venus, became identified in my mind with the divinity presiding there over the destinies of bonnets; and I mentally worshipped her under those attributes,

calling her Bonnetina. Others there were almost fair enough to be deities too, co-operating with and assisting her in her employment; but in her presence I could account them only as satellites in her train, and not as independent powers. It was something to see her white hand dividing the muslin veil that enclosed the shop-window from the mysteries beyond, and then herself emerge, as one of Homer's goddesses might have done, stepping from a cloud to reveal herself in all her glory to some enthralled votary. Simply was she clad, with few ornaments save those with which nature, in a fit of generosity, had bountifully decked her. Glossy locks,

Simply gordianed up and braided,
Leaving in naked comeliness unshaded
Her pearl-round ears, white neck, and orbéd brow.

Lips, in their cherry hue, looking so like a bright flower, that I wondered the bees didn't hasten to settle there: they would have done so, I'm sure, but for the window-panes. Eyes so shrouded by silky lashes, that I could never tell their colour. Gems they were, but whether amethyst, sapphire, turquoise, or what, I could never discover. Then there was a grace about her movements, with such a tender solicitude in them, all for the safety and prosperity of the bonnets, as was wonderful to see.

There was a newness of charm in her every action that was something bewildering. Now was she lowly bending over a bonnet, as though it were an infant, and she its mother watching its first step; now was she erect with uplifted arms, the bonnet high over head, as though it were a cluster of grapes she was gathering for an Olympian banquet; and anon was she kneeling in a suppliant attitude, as though she were offering the bonnet as a propitiatory sacrifice at the shrine of some superior deity. I am sure she loved those bonnets, every one, and that her heart bled as they were one by one sold and taken from the shop.

I almost think I loved Bonnetina, I could watch her and her bonnets so untiringly. I was known to her by sight, for a smile of half recognition would sometimes wander over her face, as she wondered perhaps what I could possibly see to interest me so much in the shop and its doings. She never, I am sure, resented my incessant supervision as an impertinence. She seemed to have comforted in her own mind recognised me as a chartered sentinel over the destinies of the bonnet-shop. I knew and studied every phase of its existence. The latest novelty from Paris was to me quite an antiquity before other gazers at the window had gathered its newness into their intelligences; and even the *papier-mâché* dummy, which I could detect filimly through the gauze curtains—a machine, I conjecture, on which bonnets were put to be trimmed, a species of anvil, in fact, representing a very pink-faced lady, with very arched eyebrows, no particular expression, and a very white bald head, when that member was unclothed by bonnets—became as familiar to me as one of my own household.

It pains me to add, that at last I loitered too long and saw too much; that one day a strangely-shaped vehicle, not exactly a carriage, nor exactly a cart, but something like a very high gig on four wheels with a huge box attached to it behind, drawn by a large horse addicted to snorting loudly, with protuberant knobs on its joints, drew noisily up to the door of the shop. Two men sat on the seat of the vehicle; one—I could notice only him—swollen and blunt as to features, with exaggerated whiskers, red in hue, smoking a cigar, cheap by its odour, and with hands large in size, and knotted and gnarled like the limb of an oak-tree. He wore no gloves, but he did a ring, which, by contrast with his hands, which were dingy of colour, sparkled brilliantly. He swung down from his seat, came with a great crash on the pavement, puffed a cloud

of very distressing black smoke into my face, expectorated fiercely on the pavement—partially, I regret to say, on my boot—and strode into the shop. What was he that he should enter that consecrated spot with so much audacity? A suggestion came to my relief regarding travellers for orders. I looked in at the door, and saw Bonnetina in the arms of the mysterious stranger—and nothing more. I shivered as I thought how many women besides Titania have been enamoured of asses' heads—how often men have bowed before idols which were but common clay after all—and I quitted the precincts of that bonnet-shop for ever.

I had something to say about other shop-windows of the cheap photographers, where we may study with advantage what distressing objects can be made of the human countenance by means of the least exaggeration of truth: of the pastry-cooks, of the haberdashers, of the ham and beef depôt; but I can proceed no further now. Let me conclude, therefore, with a re-enunciation of the principles with which I started, that to perfect Pall-Mall's shady side as the lounge of enlightened loiterers, shop-windows must be introduced. What say you, then—suppose we turn the Athenæum into a bookstall, the Travellers' into a bonnet-shop, make a second-hand clothes-shop of the 'Rag,' and convert the Carlton and the Reform into warerooms for the exhibition of unredeemed pledges!

NATURALISTS' FIELD-CLUBS—A DAY WITH THE WOOLHOPE.

HAVE you, reader, ever fallen in the way of the Natural History Field-clubs which now prevail in some of the western English counties? If not, you will perhaps be glad to hear something about them. They are not unworthy of your attention.

Perhaps if you, a stranger, saw one of these fraternities at its field-work, you would feel regarding them much the same doubt as that which Beattie speaks of as being entertained regarding his Edwin:

Some thought him wondrous wise, and some believed him mad.

We beseech you, lean to the former theory, and you will be nearest the truth. The catching of butterflies, the inspection of mosses and lichens, and the chipping of stones on the wayside or in quarries, may look to the unlearned as foolishness; but others well know that in such pursuits there lies a game profound. The Transactions published by three several West of England clubs—the Cotswold, Woolhope, and Malvern—would alone bear us fully out in what we are asserting.

Will the gentle reader please accompany us for a day with the Woolhope? On a summer morning, between the hours of six and seven, a dozen middle-aged personages are seated around the breakfast-table of their honorary secretary in the old city of Hereford, some doing justice to the morning meal, others preparing their botanical cases; some sorting pins for unfortunate insects, and others arranging their geological apparatus, comparing clinometers, or chatting over fossils. Soon the arrival of the 'bus puts an end to the arrangements, and in a few minutes the whole party are off to 'the hills' by the train.

We have amongst us two or three county gentlemen, a city banker, two or three country clergymen, a couple of doctors, an architect, a lawyer, and a tradesman or two; yet, strange to say, for the livelong day we hear nothing of magistrates' meetings, or the late conviction of Betty Jones; not a word of High Church or Low Church, Broad Church or no church; the funds are at a discount, and law and physic are alike thrown to the dogs. As the train passes rapidly onwards, hills and quarries, rivers and plains, birds,

beasts, fishes, and insects are the topic of conversation, until the spot is reached where the day's investigations are to commence. Here probably some local members are assembled, and shouldering our haversacks, away we go.

As the particular object of this day's ramble was the geology of a part of the Welsh coal-field, I may be excused if I give an outline of the geology of the district, independently of our individual experiences. Taking our stand, then, upon the Vans of Brecon, the Gadir above Talgarth, or the Blorenge above Abergavenny, and looking northward, we behold a greater amount of geologic record than we can see elsewhere in this part of England. We look upon the country of the Cambrians and Stiper Stones, on the classic ground of the Longmynd, Caer-Caradoc, and the Upper Silurians of Ludlow, Kingston, and Presteign; we see the hills and dales of the Old Red Sandstone, and the distant outline of the carboniferous and trappean Clees.

And what, then, are the particular points—what the lesson the geologist would impress upon the mind of the beginner, when pointing out the Cambrian Longmynd, the Silurian Caradocs, and the wide expanse of Old Red Sandstone that stretch forth in the distance before him? It appears that philosophers have good reason to believe that the *interior* of this planet is composed of various minerals, molten by the intensity of heat myriads of ages ago; the now crystalline masses of Plutonic rocks that compose the *inner crust* of the planet's surface 'were formerly fluid—possibly were formerly gaseous and nebular.' The Plutonic rocks that support the rocky shell of the globe we occupy, are ancient beds of lava, cooled gradually at enormous depths in the dark recesses of the planet's bosom, and have been raised by earthquake action and volcanic agency, from a depth of many thousand feet in the earth's interior, to the surface.

It is on these formerly molten, and now solidified Plutonic masses, that the lowest aqueous stratified deposits rest, and the Longmynd consists of these. With these earliest aqueous rocks, we possess indubitable evidence both of the action of the atmosphere, and the existence of water; also, that from the remotest epoch of this planet's history, the laws which govern inorganic matter have continued unchanged, and mineralogical, chemical, and mechanical laws have acted the same part.

The Cambrian sedimentary rocks of the ancient Longmynd bear upon their surfaces the marks of the ripple of sea-waves, and the impressions of rain-drops, as well as tracks of marine worms and the remains of zoophytes and crustaceans.

Hence the geologist draws two deductions: In the first place, from the earliest ages of geologic history, the chemical constituents of the atmosphere have decomposed the mineral substances of the most ancient Plutonic masses, whenever or wherever exposed to the surface; while *water* has transported the débris of those rocks, in the form of boulders, pebbles, sand, and mud, to depressions in the earth's surface; and this débris became in time layers of stratified deposits—much as stratified rocks are formed in the present day. The history of those Cambrian sediments differs little from the history of aqueous deposits now forming beneath the waves of the Atlantic and Pacific, and the *agents* were the same.

Again, although the Longmynd deposits are the *lowest known* basement aqueous formations, we cannot but reflect that later discoveries teach us that they are no longer to be considered *azoic*, or destitute of evidence of the creation of *life*, while, although the animals hitherto discovered are of low organisation, they occur towards the base of 26,000 feet of Cambrian aqueous deposits; and thus teach us the important lesson that, as far as our present evidence goes, there were no life-

less seas, no useless atmosphere: with the first evidence of *water* upon this planet's surface, we have proofs of the introduction of life!

Passing upwards from the Cambrian rocks, the geologist finds new proofs of the exertion of Creative power. 'Old actors go out, and new ones come in on the stage of organic existence, and each formation is, as it were, the lifting of the curtain, and the discovery of a new scene.' The Lower and Upper Silurians added to the Cambrian deposits, amount to a thickness of ten miles. The Llandeilo rocks of the Corndon and Shelve district, may be seen from the mountains of Brecon; and the distant Snowdon is now known to consist of strata of that Lower Silurian epoch. In these beds, for the first time, the mollusk makes its appearance (*Lingula Davisii*), accompanied by the graptolite, a zoophyte allied to Virgularia (a sea-pen). The Caradoc hills are also visible; and the geologist calls to mind the contemporaneous Lower Silurian deposits in Shropshire, on the flanks of the Malverns, at May Hill, Huntley, and the hills of old Radnor; all of which localities he beholds from the hills of Old Red Sandstone that rise on the edge of the coal-field of South Wales.

Step by step, as we ascend the geologic ladder, we find evidence of the creation of new animals, new shells, new corals, new trilobites; upwards of 1000 species of animals are known in the Lower Silurian rocks of Great Britain; while in Bohemia, Mr Barrande has discovered 1500 species of Cambrian and Silurian fossils, all of them before unknown there, and nine-tenths of them distinct from the species of Scandinavia and England.

The typical rocks of the Upper Silurians may also be pointed out in the magnificent view outstretched before us. The Woolhope valley of elevation is distinctly seen, and the Upper Ludlow rocks of Aymestry, Presteign, and Kingston stand out boldly against the sky. To corals, shells, and crustaceans, the geologist now adds the evidence of the creation of fish, and remembers that the upper rocks of the Upper Silurians contain the first evidence of the existence of fish and terrestrial plants in the bone bed of Ludlow and the Lycopodiums (club-mosses) of Gammage Ford.

We now reach the epoch of the Old Red Sandstone, the strata of which are represented by a mass of rocks in this district not less than 10,000 feet thick, and which cover up the Upper Silurians and their catacombs of organic remains.

This series of rocks presents geologically a new epoch in the history of the development of the planet, in its air-breathing reptiles and armour-cased (ganoid) fishes, its tree-ferns, marine and fresh-water shells, and very highly developed crustacea. Who shall tell of the ages that elapsed from the commencement of the deposition of the Old Red Sandstone, until the close?—who of the denudation, the wearing down of hundreds of square miles of stratified deposits, thousands of feet thick?

Let those who would study the problem, investigate the geologic phenomena in this district alone—mark well the evidence, the insuperable evidence presented, of enormous denudation on the heights of the Vans of Brecon or the sides of Pen-Cerrig-Calch, and reckon the time necessary, first, for the deposition of the strata, and then for their after denudation, if he can!

Nor is this all. As far as our present evidence goes, we remind the tyro in geology, that throughout all the depths of stratified beds below the Old Red Sandstone, we have but a very partial glimpse of the existence of a terrestrial flora, and that it is in strata of the age of the Old Red that we first begin to recognise with any confidence that 'green web which has covered our earth ever since the dry land appeared.' It is important to remember that the Carboniferous or coal-bearing was not the *first luxuriant vegetation*, but that the land of the Old Red Sandstone epoch possessed its

tree-ferns and knorria that clustered in thickets beside its waters; while we also call to mind that, although myriads of ages have passed since the sun shone upon the ferns of the coal or the last of the calamites, the more ancient vegetables of the Old Red Sandstone had perished and become fossil before many of the coal-plants had been summoned into being.

We must not, however, forget the explorations of the Field-club. The Old Red Sandstone passes upwards from old red conglomerate into yellow sandstone, mountain limestone shale, mountain limestone, and millstone grit; and it was this succession of strata the club visited on the occasion in question.

We ascended the Blorunge in a fog; and the strange fantastic shapes of the boulders that were scattered on the hillside in every direction, often drew exclamations of surprise, as we trudged along, like Southey, growling at 'clouds and weather.' We wondered, too, how the boulders got there, as many of them were evidently not parts and parcels of the Blorunge, but had been carried there somehow from a distance. If I remember rightly, I argued for ice and the glacial theory as the transporting agent; others were for 'waves of translation;' while one gentleman suggested that they might be relics of a game of 'chuckie-stones,' played by Old Nick or some demon of the hills. Our guide, who, fortunately for us, knew every inch of the ground, pointed out where rivers and mountains, and distant churches, and 'the loveliest scenes' ought to have been, and no doubt were, if we could have seen them. As it was, the mist and cloud drew largely upon our imaginations.

There is not much hospitality on the heights of the Blorunge; but an investigation of the cairn erected by the government surveyors on the summit might still furnish a bottle without the sherry, which was quaffed to the toast of 'a brighter day and better luck next time.'

It was no wonder after this, that there was a burst of delight among the naturalists when the fog cleared and the sun lighted up the bare rocks, and heath, and glens, and hills, 'smooth, and green, and dry,' arose before and around us; while some of us felt with the Ettrick Shepherd, 'after a', what is any description by us poor creatures of the works of the great God?'

It was in descending the hill that one of the party, who had separated from the rest, gave a loud view-halloo, and we quickly joined him to inquire into the *find*. It was the impression of a large fluted trunk of *Sigillaria* upon a mass of millstone grit—a carboniferous plant which Dr Hooker believes to be cryptogamous, and allied to ferns. What a blessing is a knowledge of natural history! A casual observer would have passed this relic of another world—not so the geologist! The form and foliage of the original tree—the aspect of the land on which it grew—whether a river washed it out to sea—whence came the boulder of the millstone grit itself—were the particles that made up the grit imbedded with the ancient tree? these questions furnished us with discussion and pleasant chat for an hour after we had left the relic of that tree of a coal-forest, still lying on the portion of the old sea-bed which received it when first imbedded. It must not, however, be supposed that the country naturalists skipped from the Old Red Sandstone to the millstone grit, and left the intermediate rocks (limestone shale and carboniferous limestone) unquestioned and unsearched; on the contrary, both were examined, attacked with hammers, and their treasures stored.

As we before remarked, the upper beds of the Old Red Sandstone are succeeded by limestone shale; the shale by thick beds of coralline limestone; and this by millstone grit, coal-measure sandstones, ironstone, and coal.

The previous remarks on the fossils of the Old Red Sandstone, its reptiles and plants, apply to Scotland

and Ireland, and indicate the *proximity of land*; while in Ireland, contemporaneous deposits appear to have been deposited in great fresh-water lakes—witness the *Anodon Tukesii*, undoubtedly a fresh-water shell. In Herefordshire and the Shropshire district, however, these strata must have been deposited in *deep water*, as the only relics we possess are sodden and water-worn sea-weeds, a few scattered remains of the fishes so common in Scotland, and no shells. Probably the depth of the sea was too great to allow of the existence of the mollusca throughout the area under review; and, for age after age, deposition of sand, and mud, and conglomerates went on. That ocean-bed at last shallowed, and became a fit habitat for shells, corals, and the fishes that were their contemporaries. Be this as it may, at the very base of the limestone shale is a true *fish-bed*; while, as we journey upwards, myriads of animals testify, by their dead and stony forms, that in the mountain limestone sea they lived and died. The sea-bed had shallowed towards the period of the upper sandstones, fishes swarmed in the waters, and some volcanic outburst slew them by thousands; for what other cause can account for their sudden destruction! The ocean-bed still shallowed, and the coral animal built its barrier-reef and raised its habitation above the waves, while the *Productus*, *Orthoceras*, and other mollusks harboured in the same localities, and were entombed in the same grave.

In some localities, this rock is made up of a mass of corals, and the geologist can hardly visit the grand scenery of the mountain limestone, whether among the crags and peaks of Derby or Cumberland, the noble St Vincent's Rock at Clifton, or the glorious scenery of the Wye, without seeing everywhere imbedded, the wreck of coral and encrinal animals of another world, and the relics of which are often employed to erect the habitation, frequently the mausoleum, of the human race. Nor has the coral animal ceased its work, though the genera and species may be changed: For more than 4000 miles of linear space in the Pacific and Indian Oceans have these apparently insignificant polypes reared their rocky habitations; and the principal difference between the history of the recent coral formation and that of the mountain limestone is, that the former build their stony mansions on the heights of a continent which has gradually sunk beneath the waves, while the latter reared their indestructible monuments on the rising and shallowing bed of an ocean that was filling up with the débris of other lands destroyed.

The geologist can hardly study the records of his science without becoming convinced that, ever since the creation of ocean and land, oscillation has been constant and unvaried. There probably is not one square inch of dry land upon the wide world's surface that has not been, during some past period, below the waves. The highest mountain-ranges bear upon their flanks the tenants of former seas, which have been thrust upwards from their former sites, gradually, and by degrees, by those ever-active agents within the planet's bosom, the volcanic forces, which elevate some portions of the earth's surface, and depress others.

That such is the evidence furnished by the phenomena of the 'millstone grit,' where it rests upon the mountain limestone, we can hardly doubt. Some great change of the physical geography must have occurred, probably an elevation of contiguous land, and the depression for a certain time of the bed of the mountain-limestone sea. The millstone grit and sandstones in some parts of England, cover up to a great thickness, with rolled conglomerates and sandstones, the extinct animals of the limestones and limestone shale. Sea-waves and currents washed above their relics hundreds of feet of rolled pebbles and drifted sands, and we know that the coral animal and its associated shells

could not exist in deep water. Land, however, was not distant, for the plants of the coal leave their impression upon the sandstones and even the coarser grit. Again, the sea-bed rose, until shallow water and swampy land occupied the site where deep sea-waves had rolled before.

The Palaeozoic coal period, with its luxuriant vegetation, its reptiles, fish, and insects, drew nigh, and what period more strange in all the strange epochs of this planet's history?

Had Sir Humphry Davy discovered potassium, and thrown it into a tub of water, in the presence of the first James, he would certainly have been burned for a wizard, and we know the tender mercies of the bigots who tortured Galileo!

Our great-grandmothers would have scouted the idea of the electric telegraph as a Munchausian fiction, or the history of coal as a 'device of the wicked one' to ensnare philosophers. Notwithstanding the prejudices of our excellent progenitors, the results of many years' observation by geologists, botanists, and microscopists, have established the fact, that *every particle of the coal we burn is undoubtedly of vegetable origin*; and a very remarkable fact it is concerning one of the commonest articles of daily life.

Let any one, ignorant of geologic facts, sit down quietly by his fireside, and as he watches the cheerful blaze, be told for the first time—that every portion of that bituminous substance consists of the remains of trees and plants that flourished myriads of ages ago—that in times so remote, the animals which were the contemporaries of the ancient groves and forests, that furnished this vegetation, were entirely different from any that now inhabit the earth's surface—that the existing races of animals were not created until myriads of years after the carboniferous or coal reptiles, fish, insects, shells, and crustaceans, had become stone, and the plants of that coal-period, consisting of strange tree-ferns, stranger club-mosses, gigantic reeds and conifers—forms that have now scarcely a type—had become coal! Is it not a most strange history?

Yet what is this compared to the reflections that must sometimes cross the mind of the geologist when he compares the history of the past with that of the present—when he stands among the wreck of forests of a world gone by, and reflects upon the marvellous history of the black and now mineral mass before him. Once green, bright, and beautiful in the sunshine, now a stony mass, sought after by thousands of intellectual beings, stocked into, and upheaved, from the bowels of the earth, to rejoice and comfort myriads of the human race. What a blessing does it shed upon the poor man as well as on the rich; how many a cottage does it cheer, and how wretched the home altogether without it! Again, the rail-carriage rushes through the air, and the frigate ploughs the waves by the aid of gases, which have been stored in coal for untold cycles of ages in the recesses of the earth. These remains of an extinct vegetable creation rest above the relics of extinct marine organisms; while one of the most remarkable facts connected with the history of this Palaeozoic vegetation, is the simultaneous luxuriance of this ancient vegetable world in almost every known region of the globe. Forests, whose vastness and shade are unknown to have been enlivened by the song of the bird, flourished in every latitude—for the plants of the Palaeozoic coal are found beneath the ice and snow of Spitzbergen—and the same ferns, reeds, club-mosses, and conifers grew at the same period in arctic and antarctic, tropical and temperate zones—in Australia, Europe, America, Asia, and Africa. In that distant epoch, in *all latitudes*, that strange vegetation appears to have been present and to an extent that often strikes the geologist with awe, when he reflects on the untold ages that must have elapsed during the elaboration of a

vegetable kingdom that he may dream of, but never behold.

In our South Wales coal-fields, the coal-measures are estimated to attain the thickness of 12,000 feet; 100 coal-beds are intercalated at various levels, and we have undeniable evidence of successive terrestrial conditions. The coal-fields of Nova Scotia are nearly *three miles thick*, cover an area comprising 36,000 square miles, and contain 51,000 cubic miles of solid matter (*Lyell's Manual of Geology*).

Compared with the American, our English coal-fields shrink into insignificance, and the knowledge of such facts should awaken feelings of the sublime as regards the exercise of divine power, even on such unsentimental subjects as coal-fields.

The moment, therefore, that the beginner puts his foot upon the coal-measures, let him recall some of these great facts connected with their natural history, and he will find it impossible to study the phenomena of the fossil plants, their varied form and structure, their ancient and present chemistry, and their geological history, without also discovering fresh proofs of the wisdom and goodness of the Creator.

Bearing in mind, then, the vegetable origin of coal, its chemistry and constituents, the enormous amount of vegetable matter necessary to compose the coal-fields of the world, the wide diffusion of identical species of coal-plants, the vegetable organisms the microscope discovers in every block, and their association with extinct animals known to belong to the carboniferous epoch, the cryptogamic character of the vegetation, and the absence of any known existing plant or tree, we would draw to a close the reminiscences of some lessons learned and facts examined on a day's ramble with the Woolhope Naturalist's Field-club. The great use of these societies is the interchange of ideas, and the opportunities which constantly occur of meeting with others better informed than ourselves. I, for my own part, can affirm that many a difficult local problem has been worked out through questions asked at these meetings, and which at the moment were unanswered, and apparently disregarded. Sir Roderick Murchison has lately met with a stringent geological question in the Kingston district, as regards certain transition beds between the Old Red Sandstone and his Upper Silurian, and the puzzle was furnished by a member of the Woolhope Club (Mr Banks). The Woolhope Club lately visited the district under review, and met with the very remarkable phenomenon, in England at least, of the great facts of geology carried home to the hearts and minds of working-men, by one of their most active and working members. Honour be to those to whom honour is due!

A gentleman, resident at Beaufort, near Abergavenny, has taught the principles of geology to several of the miners of the district, and some of us were put to the blush by the superior knowledge of the coal-plants displayed by those whose bone and sinew raised the fossil fuel from its long resting-place. Fancy a stalwart miner taking you to his little museum of fossil plants, and pointing out the difference between *Sigillaria* and *Stigmaria*, and speaking even eloquently upon the beauty of extinct ferns! Nevertheless, this phenomenon came under the observation of us county naturalists but a very few weeks ago. May we not, then, yet hope that the common things of common life shall yet become known to working-men, and that the knowledge of God's works shall be no longer a sealed book!

It is a great mistake to suppose that it is necessary to be highly educated, to be a classic or a mathematician, in order to be a naturalist. A large amount of the knowledge of God's works is within the reach of every one; and some of the most eloquent writers have been working-men, who have carried on their

pursuit of the study of nature amidst the hard struggle of a laborious life. Who can forget the opening of the *Old Red Sandstone*, and the conviction expressed by the writer, and impressed upon his readers, that 'there is no necessary connection between labour and unhappiness, that a very exquisite pleasure may be a very cheap one, and that the busiest employment may find time to enjoy it?'

A LADY'S OCCUPATION OF SVEABORG.

We had left St Petersburg with a resolute determination to enter Sveaborg; great was, therefore, our disappointment when our demand for admission was answered by a positive but very polite refusal. No foreigner was granted a permission, and without a permission, no one could enter.

I know not how it was that an inspiration came to me, and prompted me to seek—not at the residence of the governor of Helsingfors, but in the summer-house-like ball-room of the pretty wooden building where mineral waters are manufactured, in the rocky gardens nearly opposite to that renowned fortress—for some assistance in effecting the object for which we had made a two days' voyage. We had not the least wish to return to St Petersburg satisfied with an outside view of its rocks, or of the guns that peeped over them. It was, however, merely to gratify our English fancy for being able to say 'we had been;' because, being very peaceably inclined, and knowing nothing whatever of the art of fortification, we could not hope to do our country any great service by the exploit we meditated. Moreover, the refusal, if it did not excite our courage, annoyed our feminine self-will, and to effect an entrance into Sveaborg became to us a sort of necessity—a decided point of honour.

I asked a young lady to accompany me to this ball-room. She was seized with a fit of shuddering: she was so nervous, she said, and could not, in any case, go there without her papa: ladies never went into public unattended by gentlemen. I knew this was quite a Swedish law, and the good folks of Helsingfors are mostly Swedes still by nature.

Nevertheless, as she loved the English well, I won her over; and, under the promise of protecting her from her enemies, she agreed to come to the little ball where ladies danced in their bonnets.

The inspiration that drew me there was not at fault. A very fine lady was soon presented to me, whose first question, as is customary to a foreigner, was, wherefore had we come to the little town of Helsingfors, where there was less to be seen than in our own country.

'To enter Sveaborg,' was my reply.

'That is not possible,' she answered, 'just now.'

'I think we could do it, if we tried,' I rejoined. 'It would be dreadful to have our object defeated—if any one would help us'—

I continued to talk without perceiving that our nervous little friend, Mamsell M——, was whispering at the farther ear of this fine lady.

What was settled between them we did not know, but the latter, turning to me, said: 'Well, well, be tranquil, madame; I think you will succeed.'

And the timid mamsell—which title is the Swedish or Finnish translation of mademoiselle—whispered slyly: 'To-morrow we shall be in Sveaborg.'

'Now, is it not extraordinary!' I answered. 'You certainly thought my taste for balls was outrageous; but something told me this ball-room would prove a stepping-stone to Sveaborg.'

'Perhaps, then, if that were your only purpose, you would now wish to come away? The carriage waits, and as papa is not with us'—

'Take my arm, and let little Harry walk at your

other side; thus you will find yourself well protected; and let us also come away directly,' said I; and thus defended, Mamsell Malvina M—— walked to the carriage.

The next day a boat was waiting in sufficient silence at the foot of the landing-steps nearly opposite our abode. Mamsell Malvina now took us in charge, and we set off for Sveaborg.

The plan of operations had not been submitted to us: so far as we could understand, our entrance was to be effected either by surprise or treachery; the only condition imposed upon us was, that we were to be speechless, and trust to our leader. Our boat followed in the wake of that belonging to the fortress, which discharged its cargo precisely as we drew up to the rocky steps beneath the gates.

Some persons residing in the fortress, or who had come there on business, delivered their pass, and entered before us. A smart officer demanded ours: we had none to give. I expected the great gates to be shut in our faces; but with the greatest composure our fair Malvina answered, that she had come to see the commandant.

To see the commandant? The words were more than usually electrical. The officer stepped back, raised a hand to the side of his face, and, drawing himself up in a military salute, delivered us over to a soldier of the guard, desiring him to convey us to the house of the commandant.

We arrived at a large, barrack-like edifice; the rather poor doorway was guarded by two sentinels. There we were made over to another guard, who took us in charge until the soldier summoned a domestic servant. The man appeared excessively bewildered by our visit, and utterly at a loss how to act. Mamsell Malvina told him her name, and said she had come to see the commandant. As there was no lady in the case to whom the visit was to be paid, it was all the more perplexing. With a very unwilling countenance and hesitating movements, the man let us enter the hall, or passage, and then he went away, and appeared to us no more. Perhaps he only let us in because he saw our leader would not be kept out. He probably reported the fact of this outwork being in her possession to some higher subordinate; for, after a long time of patient occupation, a voice called from the top of the stone-stairs to ask who was there.

Mamsell Malvina M——.

What did mamsell want there?

To see the commandant.

The commandant was then engaged; but as it would not do to suffer his visitor—especially when that visitor was a lady, and a young one—to stand in the entry of such a house, the case was again reported to some other subordinate authority; and again a voice called over the stairs for mamsell to advance. Looking back to us as she did so, she told her servant-man to follow her; and taking this as an intimation that we were to remain, we stopped short on the cold, dirty stairs. We waited there so long, that we began to think the possession of Sveaborg itself was scarcely worth the trouble we were taking for its inspection only. However, I sat down and amused myself with reflecting how very droll it was to be sitting on the cold, dirty stone-stairs in the commandant of Sveaborg's house.

Some one, apparently, at their head saw us thus posted, for again an invisible voice—at least, the voice of an invisible being—in a more friendly tone, asked us to come up and sit in the corridor. By this we gathered the important fact, that our leader was engaged in conference. In the corridor we found a friendly-looking officer, who, while as much mystified as his subordinates, seemed disposed to put a smiling face on the matter, and to look rather quizzical. The door by which we concluded our leader had entered was shut, and we were afraid to disobey orders by

speaking, though, for my part, I felt very desirous to do so. Fortunately, our capacity of passive endurance was not put to the Russian extremity of proof. An officer of engineers came along the corridor, looking delightfully important, and carrying in his arms a vast quantity of designs on card-board, which the good-humouredly smiling one informed us were plans for the re-edification and enlargement of Sveaborg. An involuntary movement of curiosity on our part, as the door opened to admit him and his plans, was noticed by the smiling officer, who invited us to follow into the ante-chamber of the commandant.

Thus were we slowly, but steadily, advancing; all the outworks had been carried by our undaunted leader, and to follow with due caution, was our only duty. In short, a minute or two more placed us in view of the great general himself, standing, with some of his staff around him, and our little leader sitting full before him. I wondered at his courage. He is of fierce visage, that commandant, with a restless, wild expression, that might well keep at bay the stoutest of our admirals, let alone an unprotected female. Indeed, limited as my own knowledge is, I know personally only one of the leaders of our hearts of oak who has a peculiar fancy for encountering such a style of physiognomy.

As for the figure, it was in full uniform, the bust covered over with decorations and medals that were almost as fearful to encounter as the physiognomy. And seated demurely on a chair fully confronting all, was dear little Mamsell Malvina, our gallant leader, with looks so demure, and eyes so straightforward-looking; while the fiercely-visaged, restless-eyed commandant of Sveaborg stood before her with an air of no little perplexity. The allied fleet, I suspect, never perplexed him as much.

Mamsell Malvina had come to see him, that position was clear; might he inquire what was the object of her visit?

She wished to see Sveaborg.

Mamsell was in Sveaborg. She could retire when she pleased.

Mamsell wished to inspect the works; she could not do so without the good commandant's order.

What possible purpose might Mamsell have in inspecting the fortifications? Did she, perchance, wish to make some descriptions?

Mamsell Malvina was not in the habit of making descriptions, and did not, in the least, understand fortification.

Where, then, was the utility of viewing the fortress?

That Mamsell Malvina could not at all say: it was a fancy of hers; she had a wish to do so, and she knew the good commandant would enable her to do so better than any one else.

Just at the moment, the officer of engineers, with his plans, stepped from the ante-chamber into that where the discussion was carried on. The restless eye of the commandant grew a thousandfold more restless: it was plain that his whole soul—his heart, at least—was in those plans. He gave a hasty order: it was as hastily obeyed. A tall, thin, young officer appeared, as if moved on by wires, at the door, and stood passively there.

'Take charge of this lady round the fortress, and shew her'—A wave of the hand certainly left that young man a discretionary power, for the commandant, with a hasty bow, was turning away to follow the plans, when his eye fell upon us. Queen Mary of England said the name of Calais would be found graven on her heart after death. I do not say so much; but I am sure the eye of the commandant of Sveaborg is graven on mine at this present moment.

It was perfectly a *ruse de guerre* which enabled our leader, by the most graceful Swedish courtesy, to cover our retreat. And when, with our Russian escort, we

crossed the boundary and found ourselves in the open air, we not only began to breathe freely, but in our hearts to marvel at that singular faculty that makes wise men, in ordinary circumstances, pass for fools, brave ones rate themselves as cowards, and firmly nerved young ladies appear shy-faced and tremulous.

We sallied forth from the quarters of the commandant, full of confidence in the strategical powers of our commander; but, as regarded our own line of action, we were now doomed to experience that the results of devoted obedience and settled purpose are frequently made to depend on accidents of a most trivial character. If a man is often made a hero by an accident, we need not wonder if a woman be led to change her tactics by a look.

Thus, for example, Mamsell Malvina was to be the only one of our party who possessed the prerogative of her sex—the use of the tongue—the only weapon universally conceded by the so-called stronger sex to the weaker. But, by a provoking accident, it happened that it was not to her our Russian guide would address his speech; he seemed bent upon tantalising our national courage, or tempting our pledged obedience, by words and questions that appeared meant to provoke answers. At last came one of the latter, accompanied by a look that human fortitude—at least such an amount of that quality as I possessed—could not resist. I answered—I spoke.

'Ah, madame, *vous êtes Anglaise!*' was the instant reply. (Ah, madame, you are English?)

'Yes.' What else could I say, since a true Briton must not hide his colours. But, by way of extenuating my breach of orders in the judgment of our little leader, I asked: 'How could you know that?'

The young Russian did not reply by telling us our English tongues generally betrayed us, but with a knowing smile he accounted for his sagacity by saying:

'Ah, I was three days in England. They took me to your Plee-mont before I was sent to France.'

'What! you were a prisoner of war?'

'Yes!' laying an open hand on his breast. 'Your soldier struck a bayonet here at Bomarsund; but one of your officers saved me.'

Who could help regretting the use of speech now? Perhaps in my case it was too late to learn obedience; or, worse still, perhaps, the object having been gained, the leader we had followed was suffered to fall to the rear. However that be, a fraternisation at once took place with the interesting young wounded prisoner of war.

He appeared to be consumptive, poor fellow, and complained of the confinement of Sveaborg more than of the imprisonment he had undergone at Tour. The dreary monotony of life on this island-rock, the so-called Gibraltar of the North, must be worse than that undergone on the more splendid Gibraltar of the South.

No one can leave it, even for the adjacent town, without permission from the commandant. And to such a confined and monotonous life, the military, he said, might be subjected for as much as ten years at a time. The heat was now excessive. He seemed to feel this monotony relieved even by our chance visit. While walking to the church—which, as if he had been a real guide, was, he thought, the first object we might wish to see—he gave us some hints about the fall of Bomarsund.

'There was no great glory in taking Bomarsund,' he said; 'it was an unfinished fortress—in fact, only a fortified barrack with guns in the windows; and we had a garrison of 1200 men against the allied fleet of England and France—40,000 assailants against 1200.'

'Oh!' little Harry ejaculated; but an admonitory touch silenced his combativeness.

We had chanced, before this, to have been in

company with the late commandant of Bomarsund—a little old man, whom, doubtless, other people recollect. His feet appeared to be gouty, and his eyes were defended by square green glasses. Some of his country-people told us, that if the Emperor Nicholas had lived till fate restored him to his own land, he would have been shot.

'For what?' we asked. 'For surrender?'

'No; for defence. The emperor wished Bomarsund to be evacuated without waiting an assault; but this commandant wrote to him that the place was tenable, and the garrison willing to die within its walls, but not to evacuate them, and craved permission to do so. The permission was granted, but not acted upon. The emperor's opinion was right, and he was very angry at the result of the attempt at defence.'

I do not believe, however, he would ever have thought of lessening the number of the brave old general's days. The church is the most prominent object in all Sveaborg, and by far the finest edifice. In Russia, war and religion go hand in hand; a true Russian always believes he is fighting for his church and his faith; for his country is identified with both. Seen at a distance on the gulf, this blue dome mounts aloft far above the death-dealing batteries it seems to command. It still bore conspicuous evidence of its share in the last combat. A great rent was visible, which had been made in it by a shell from the besieging fleet. At each side of the church door were piled five cannon-balls—English balls, they are all called, perhaps to do them more honour. They are left there, I believe, to shew that they could not get within the church walls.

Who can tell what a history time may give to these balls? They will probably, if Russia and her church go on for the future in accordance with the past, come to be one day the subjects of a miraculous legend, attached, possibly, to some particular patron, whose picture these ten cannon-balls were fired at in vain by the English; just as half a century ago the French vainly expended their ammunition against the Kremlin picture. And so at last they will be regarded with veneration instead of aversion; and the poverty of the real history of the attack on Sveaborg will be draped, in process of time, with a fanciful and pious tale, calculated to cherish the steadfast belief of the primitive Russian in that saintly protection which he believes ever has defended, and ever will preserve from foreign, and therefore heretical foes, the land where alone the true faith exists. The rent made by the shell in the blue dome remained unrepaired, perhaps because it is to be included in the general works of reparation about to be commenced. Our young guide led us up to a picture on the sanctuary wall, and shewed us a small splinter of this shell fastened to its frame, and then pointed out a slight scratch on the painting; leaving us to infer, from a half-and-half sort of manner of exposition, that it had not been able to do more than give that little scratch to the saint's image; and in lasting memory of its audacious assault, was fastened to the frame for life. He merely shewed us the fact, leaving the measure of belief quite to ourselves.

From the church we proceeded to the batteries, which no visitors, even natives, are allowed to inspect; but we—truly safe inspectors, as we knew nothing about them—had come from the commandant's house, and been given an escort by the commandant's own self; we were therefore naturally supposed to be the commandant's good friends. Our guide was most kindly desirous to explain all to us, but I believe Mamsell Malvina, though she listened to him, understood nothing more of assault and battery than we did.

There was a good deal to tell a tale of itself: blackened, roofless buildings; cannons whose roar was

stilled for ever—visible demolition of works still apparent. The chief damage was done by the explosions of three magazines. The officer said they were small ones.

'And if a large one had followed?' we inquired.

'Then, indeed, it would have been very nearly all over with them here,' he answered with a pleasant smile.

The smile was so pleasant that I said in answer:

'Do you know, I think it was very nearly all over with them as it was.'

'No; not then. But your Nap—peer could have done something for us if they had allowed him.' Before I could ask an explanation of this saying, he pointed in another direction, and added: 'One of your officers came there sounding; he never minded the guns, though the shot was falling on the water, but went on just as if they were fishing.'

'But why did not the shot fall on his boat instead of on the water?'

'We could not get the guns to carry then: they never reached your ships.'

'Why had you not guns to carry further, or people to serve them better?'

'Because we were ignorant. But now we know better: we are prepared for you when you come again.'

We made him a bow, and said that the same case both had been and was our own.

We might have assumed a belligerent tone, for as he irritated me by that now common remark, that one particular person might have done something for them—that is, against them—if he had had better means, I was just going to ask if he knew why another had not finished doing something for them, when our own precious little leader, who had effected for us an entrance into Sveaborg, came up with a face that appeared at once to suggest a peace-conference to our young hero of the wounded breast: and he left me standing with my hand upon a gun, and eyes staring over the tranquil water of the gulf, to make out a reply for myself to the question, while he, I believe, set about an easier work; for then we have reason to hope that a negotiation was opened on the batteries of Sveaborg which may lay the foundation of a future and permanent alliance. Leaving the young Fin and Russ to discuss three, four, five, or as many points as they pleased, we stood looking in silence over a scene of perfect repose: not even the tread of a sentinel broke the silence of the rocky ground, nor the splash of an oar the stillness of the glassy water. And we recollected the words of which the fulfilment appears yet so distant: 'Men shall learn war no more.'

I often think of that young Russian with a feeling of regret. As he stood erect with feet drawn together, and the side of his hand to that of his face, in the fashion of a military salute, while we moved away from the rocky isle, I felt that his had been one of the passing acquaintances which we wish so much to renew, perhaps partly because there is no probability that we ever shall be able to do so. He and our young companion may often meet when we are far distant from both. For our parts, we were impressed with the conviction, that where cautious reserve is abandoned for frank kindness, an honourable prudence on the other side is more imperative; and in this conviction do I thus glance over the details of our visit to Sveaborg. We never meant to make any description of it, and were unable to do so if we wished it. But nothing is more abhorrent to good feeling than to read words that had evidently been spoken in friendly intercourse, set down in order in the pages of a book. Better is it to leave an article or a chapter ever so meagre, than to finish it by committing an injustice, or being guilty of an act of ingratitude.

The tomb of the founder of Sveaborg—that is to

say, of the Swede who constructed its fortress, for the hand of a mightier Architect laid the everlasting foundations—stands just before the house now occupied by the Russian commandant, who, like most of the generals in that service, is by origin a German. Like Thorwaldsen, Ehrensward chose to be buried amid his own works, but did not foresee that his tomb would be guarded by the people against whom he had erected these works. When the fortress of Sveaborg was finished, Ehrensward wrote these words in his diary: 'I can now die in peace, since I have erected an impregnable barrier between Sweden and her natural enemy Russia.'

But though Ehrensward died in peace in that conviction, his monument stands before the house which has been occupied by a Russian since the last commandant who held that fortress for Sweden delivered it up to 'her natural enemy.' That monument is one of those which form curious commentaries on human opinions or expectations.

Though it is generally said that General Cronstedt treacherously surrendered Sveaborg to the troops of Alexander I., the Russians themselves admit that it was not an impregnable fortress at the commencement of our recent war. That it may be rendered so, is not unlikely. Some of the neighbouring wooded isles in the gulf were being surveyed by the government officers for the purpose of clearing, fortifying, and erecting magazines and storehouses upon them. The re-edification of the place will doubtless considerably improve it; and thus the result of our late bombardment will be, as our young Russian said, to cause them to know better, and be prepared for us if we come again.

The passage left by the rocks between Sveaborg and the coast of Finland, or Helsingfors, is so narrow, that it was blocked up by a Russian man-of-war laid across it. The sides of this large ship are battered with shot. It stands, a disabled veteran, in the dock of Helsingfors. But our occupation of Sveaborg has terminated.

FIRE-PROOF DWELLINGS.

WHAT can be more appalling than the cry of Fire! Fire! in the darkness of night, and in the midst of a crowded city! And then, what fearful sights and sounds salute the eye and ear as we arrive at the scene of the catastrophe!—'blazing beams and scalding streams; ladders and fire-escapes; cries for water, and screams for assistance; stern countenances rushing forward to meet and grapple with the dreaded enemy, from which at the same time half-clothed and affrighted creatures are flying for dear life! Our object is not, however, to write an essay on Fire, so much as to offer some suggestions tending to shew that much may yet be done to increase our command over this element, so well called in the old proverb 'a useful servant, but a terrible master.'

Ingenuity has been frequently at work to invent the means of extinguishing fire when it has occurred, and of saving life when that is in jeopardy. But surely the more important question regards the *prevention* of the calamity. Fire-proof houses are indeed no novelty. It is only necessary to substitute brick arches for wooden joisting, in order to render any house safe against the spread of fire. But this, we suppose, is the more costly method of building, otherwise it is hard to conceive a reason for the plan being so seldom adopted. Again, when timber must be employed, it is a commonly received scientific dogma, that, if saturated with a solution of alum, it would be nearly as incombustible as stone. Now, why should any man about to invest his money, and risk the lives of his family in a building, hesitate to ascertain for himself whether this is true, and, if true, profit by the fact. It could cost but a

small sum to dig a tank in which the timbers could be soaked in the solution; and alum itself is cheap. We have heard that lime-water will produce the same effect, besides rendering the timber more durable. Doubtless, there could easily be found some means of depriving timber of its extreme combustibility; if so, are not our architects and engineers much to blame for allowing us to go on building funeral piles for ourselves, under the name of dwelling-houses?

But supposing brick-arched houses impossible, and that timber must remain as it is, there are still means which may be used to lessen the danger from fire. Every house should have several staircases, built of stone, and expressly with a view to safety. Indeed, if we had absolute power, we would prohibit the erection of wooden stairs at all; we would insist on the stairs at least being constructed with some incombustible material.

Again, in all country establishments, a proper supply of ladders, carefully ascertained to be of the right length, should be always ready, with the addition of such approved fire-escapes as have been found successful in practice.

All, or any of these precautions, are better than nothing; and it involves a fearful responsibility to neglect them. But the great desideratum after all is, not so much the means of escape from a house on fire, as to prevent the conflagration from taking place at all. We have already made some suggestions to this effect; but we have one more, which we have purposely reserved for the last, as it is that one from which we ourselves entertain the greatest hopes of success.

Again entering our solemn protest against wooden staircases *in toto*, we proceed to observe, that the imminent danger to human life from fire is one which, like some others, is almost peculiar to England.

Where wooden houses exist on the continent of Europe, they are usually low, so that on the first alarm the inmates can generally be saved, *vid* the windows, without difficulty. In other cases, the materials of brick and stone enter so largely into the construction, that it is almost impossible for fire to extend very far. But we desire especially to call attention to a mode of construction much used in Italy, and which seems to combine all the elements of cheapness with solidity and incombustibility. This we shall now endeavour to describe.

It has happened to ourselves to watch the construction of large houses, locally called palaces, in the town of Pisa, for example, in which, we can vouch for it, there was not employed one square foot of timber of any sort from garret to cellar. The only timbers in the house were those of the roofing. Every staircase, partition, ceiling, and floor was made of brick; but brick used in such a way that the arches of the ceilings were scarcely thicker, relatively to their span, than a tolerably thick egg-shell is to its own.

No words can do justice to our surprise when we first realised the fact that arches so constructed will resist any ordinary pressure; and we had to recall to our recollection that no man is strong enough to break in an egg-shell, applying the pressure at the ends. The mere fact of thinness does not necessarily imply weakness, and indeed we had ample proof of this in pursuing our observations. The arches of which we now speak are built without centering, the mason striking out his work, to begin with, by horizontal lines along the wall at the required height. If it is intended that the arch should be 'coved up'—that is, sloped from each side to the centre—he draws a line all round the room, and chips away a little groove along this line, to receive the edge of his first row of bricks, or rather tiles, which are secured in place by a little gypsum of a cheap gray sort. After the first row is completed, a second is applied, as before, with a little cement between the edges. The tiles are kept in a

bucket of water, out of which they are taken at the moment they are wanted for use. They struck us as being of a superior sort to the common red brick, harder, and more cohesive. These tiles, we also observed, are much of the same shape as if a common brick was split in two longitudinally; their dimensions being about twelve inches long by one inch and a half in thickness. The scaffolding rests on high tressels, and extends over most of the surface of the room; and as the work proceeds, a bit of stick is here and there put on end between it and the advancing arch. When the sides have been thus brought almost to touch each other, the workman cuts away from a tile as much as will just allow it to fill the remaining void with the proper quantity of cement: this put in place, the arch is complete. We have formed one of a party who have walked fearlessly all over such an arch as we have described, a few minutes after its completion. The whole ceiling may, in fact, be considered as one piece; and its convex form not only prevents the tendency to give way from its own gravity, but it will also, like the egg-shell above alluded to, resist an enormous downward pressure besides.

The next process is to fill up the hollow sides of the arch with rubbish, gravel, or whatever is most convenient; with this material, the floor is brought to a level; and then it is carefully trodden down, giving vast solidity to the whole. A coat of mortar is next laid on, and in this are imbedded other tiles, more or less handsome, according to circumstances; or, in many cases, those beautiful compositions are employed in which the taste and skill of the Italians are so conspicuous. Thus the principle of which we speak is applicable, as we can testify from personal observation, to every sort of dwelling, from the cottage to the palace.

We may perhaps be excused for dwelling a moment upon a case of fire in which the useful qualities of this sort of building were fully brought to the test. It was in the year 1829, while we happened to be sojourning in that marvellous city Genoa, that the population were alarmed with the cry of 'Fire!' Now, fire in a town in which there was then but one street wide enough for a four-wheeled carriage, and where the houses are of enormous height, is, to say the least of it, rather alarming. We joined the crowd which was pouring along to the scene of danger; and on arriving at a small open square in front of a large building called the Zecca (or Mint), we saw that it was indeed in a blaze. Now, had the system of construction been the same there as it is in London, we have little hesitation in saying that no human efforts could have prevented this city of palaces from being reduced to a heap of ashes. As it was, what we saw blazing so furiously was merely the roof and outer blinds of the building in the top story. A cordon of the fine Sardinian troops was quickly formed to supply water; the engines played steadily; the stone and brick floors of the story in which the fire had broken out were kept constantly wet, until the fire had consumed all the timber within its reach, and then it went out from want of fuel.

We have never forgotten this incident; and we think it—to use a phrase which has not been hackneyed of late—highly suggestive. In a recent visit to Italy, we had a curious experience of the fact, that in our day there is a tendency to deterioration in many things. Houses are 'run up' now anyhow, to last a certain time; 'so that,' as a wag observed, 'they and the building-leases may fall in together.' We thought the paper-house system was confined to England; but in conversing on our present topic with an intelligent Italian gentleman, he told us that in many places the mode of building with wooden joists and floors was fast superseding that which we had so much admired, and which we have attempted to describe. It is not

pretended that it is better or safer, but it is cheaper; and why? Because the bond established between opposite walls by timber joists and beams, enables the constructor to dispense with the good old quality of strength in these parts of the building—to run up, in short, his walls of mere pasteboard, which would not comport with the outward pressure of the brick-arch; while the new plan dispenses with the transport and cost of material and labour on walls of proper thickness, and rubble to fill in the cavities between the sides of the arch and the floors. In a country where human industry has so wonderfully called into play every square inch of land, there may be some force in this argument as to the greater immediate cheapness of the new system; but it is equally clear that it throws away the precious advantage of incombustibility, besides being by far the most expensive in the end. It is, of course, a mere matter of calculation, all the circumstances of the case being taken into consideration, which of the two systems—the one giving durability and safety; the other, cheapness, insecurity, and speedy decay—may be best worth adoption; but the question of safety is, it would seem, but a feather in the scale in the estimation of some of us; while with others, like the sword of Brennus, it has a weight and importance which cannot adequately be expressed in words.

We by no means grant, however, without proof of the fact, that in this country the adoption of the Italian mode—we mean the old one, which is still very extensively used—would be other than an economy. Let the architects and builders tell us what they think about it.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER XLIX.—THREATS.

Yes, the voice was Ijurra's. I knew it well. While listening to it by the mesa, I had noted its tones sufficiently to remember them—round, sonorous, of true Spanish accent, and not inharmonious, though at that moment they grated harshly upon my ear.

An indescribable feeling came over me: it was not jealousy—I was too confident to be jealous—and yet, I shame to confess I felt a sensation sadly akin to it. After those earnest oaths, those tears and frenzied kisses, so soon after! O shame upon me!

Alas! the experienced heart no more enjoys the tranquil continuity of faith. Its belief is like a broken dream—an intermittence of light and shade. It was my misfortune, my error, perhaps my crime, to remember too many pairs of pretty perjured lips.

In a word, I was once more jealous, in spite of all that had passed—of sighs, and tears, and plighted vows—once more jealous of Ijurra!

But the moment before, his name was on her tongue, and spoken with scorn; in the same breath I was assured that he was no longer in the neighbourhood, that he was far away.

No; he was upon the spot, in close conversation with her, and scarcely five minutes after the oath had been sworn that bound her to me for life! Less wonder I was jealous.

That the feeling lasted only for an instant might be some palliation, but it was no merit of mine that brought it so quickly to a termination. I cannot screen my conduct behind an act of volition; for although the poisoned sting rankled but for a few moments, during that short period I yielded obedience to its demoniac promptings.

I slipped down gently from my saddle, and with the crouching gait and silent tread of the jaguar, approached the speakers. My horse, well trained to such tactics, stayed where I had dismounted, without

tie or hopple. No fear that his hoof would betray me.

Step by step I advanced, with my hands cautiously parting the boughs. The fronds of a curious *sabal* palm befriended me. They grew vertically on short petioles, like large green fans; and overlying one another, formed a perfect screen, through which the keenest eye could not perceive the approach of an intruder.

In a few seconds, I stood behind the last row that bounded the edge of a small opening; and peering through the serrate interstices of the leaves, I saw my betrothed and her cousin. Isolina was still in the saddle. Ijurra was on foot, and standing by her stirrup, with one hand resting upon the pommel, the other grasping the rein.

Up to this moment, my heart had continued its painful throbbing; but the attitude of Ijurra, with his troubled and angry look, at once produced a revulsion in my feelings. I saw that the encounter had been accidental—at least on the part of Isolina; I saw that she was detained. I could not see her face; it was turned in the opposite direction, and towards Ijurra; but the tones of her voice reached me, and by these I perceived that she addressed him in anger. Oh, how those accents of indignation ravished my heart; sweeter were they to me than the softest melody!

As yet, I had heard nothing of what had passed between them; the loud beating of my heart, the rustling of the leaves under my feet, of the boughs as I pressed through them, had prevented me from distinguishing what was said. These sounds ceased as I came to a stop; and although still fifty paces distant from the speakers, I could catch every word of their conversation, from the loud tone in which it was carried on.

'So, then, you refuse?'

It was Ijurra who put this interrogatory.

'I have done so before, Rafael; your conduct has given me no cause to change my mind.'

'Ha! my conduct has nothing to do with it; you have other reasons. Isolina, do not imagine I am such a *bobó*. I know your secret: you love this *gringo*—this Yankee captain?'

'And suppose I do, that is my affair. Nay, more, sir, I shall not even attempt to make a secret of it. I do love him—I do—I do.'

Ijurra's eyes gleamed with malignant fire; his lips turned white, and tightened over his teeth; he seemed endeavouring to curb the exposure of his spleen.

'And you would marry him?' He asked with compressed emphasis.

'I shall marry him,' was the prompt reply.

'*Por todos santos!* it shall never be.'

'And who is to hinder it?'

'I.'

'Ha, ha, ha! You are raving, Rafael Ijurra!'

'You may love him to your heart's content—I care not; but marry him—never; s'death! never!'

'Indeed?'

'By the saints, I swear it. I swear'—

'You have sworn enough: you are sufficiently perjured already.'

'*Carrai!* furiously shouted Ijurra, as if losing patience. 'Listen to me, Isolina de Vargas! I have something to say that may not be so pleasant'—

'You can say nothing pleasant; but I listen.'

'First, then, here are certain documents that concern you—both you and your father.'

I saw some folded papers in his hand, which he had taken from under his jacket. He opened and held them before her face, as he continued:

'This safeguard is one given by the American commander-in-chief to the Doña Isolina de Vargas. Perhaps you have seen it before? And here is a letter from Don Ramon de Vargas to the commissary-general

of the American army, enclosed within another from that functionary to your pet filibustero—a pretty piece of treason this!'

'Well, sir?'

'Not so well for you, madame. You forget that General Santa Anna is now chief of this republic. Think you he will not punish such traitorous correspondence? *Carrambo!* if I but lay these documents before him, I shall have an order for the arrest of both yourself and your *Ayankieado* father as quickly as it can be spoken. Nay, more; the estate will be proscript and confiscated—it will become mine—mine!'

The speaker paused, as if for an answer. Isolina remained silent. I could not see her face to notice the effect. I fancied that the threat had terrified her. Ijurra continued:

'Now, *señorita!* you better comprehend our relative positions. Give your consent to become my wife, and these papers shall be destroyed on the instant.'

'Never!' was the firm response that delighted my ears.

'Never!' echoed Ijurra; 'then dread the consequences. I shall obtain orders for your arrest, and as soon as this horde of Yankee ruffians has been driven from the country, the property shall be mine.'

'Ha, ha, ha!' came the scornful laugh in reply—'ha, ha, ha! you mistake, Rafael Ijurra; you are not so far-sighted as you deem yourself; you forget that my father's land lies on the *Texan* side of the Rio Grande; and ere that horde of Yankee ruffians, as you term them, be driven out, they will establish this river for their boundary. Where, then, will lie the power of confiscation? Not with you, and your cowardly master. Ha, ha, ha!'

The reply maddened Ijurra still further, for he saw the probability of what had been said. His face became livid, and he seemed to lose all control of himself.

'Even so,' he shouted with the addition of a fierce oath—'even so, you shall never inherit those lands. Listen, Isolina de Vargas! listen to another secret I have for you: know, *señorita!* that you are not the lawful daughter of Don Ramon!'

I saw the proud girl start, as if struck with an arrow.

'I have the proofs of what I repeat,' continued Ijurra; 'and even should the United States triumph, its laws cannot make you legitimate. You are not the heiress of the hacienda de Vargas!'

As yet not a word from Isolina. She sat silent and motionless, but I could tell by the rising and falling of her shoulders that a terrible storm was gathering in her bosom.

The fiend continued:

'Now, madame, you may know how disinterested it was of me to offer you marriage; nay, more, I never loved you; I told you so, it was a lie'—

He never lied in his life as he was doing at that moment. His face bespoke the falsehood of his words. It was the utterance of purest spleen. I read in his look the unmistakable expression of jealousy. Coarse as the passion may have been, he loved her—oh! how could it have been otherwise?

'Love you, indeed! Ha, ha, ha! love you—the daughter of a poor Indian—a *margarita!*'

The climax had come. The heaving bosom could bear silence no longer; the insult was unendurable.

'Base wretch!' cried she, in a voice of compressed agony, 'stand aside from my path!'

'Not yet,' answered Ijurra, grasping the bridle more firmly. 'I have something farther to communicate'—

'Villain! release the rein!'

'Before I do, you shall promise—you shall swear'—

'Again! let go! or this bullet to your heart!'

I had sprung from out the thicket, and was running

forward to her rescue. I saw her right hand on high, and something shining in its grasp. It was a pistol. Its muzzle was turned upon Ijurra.

No doubt the resolute character of her who held it was well known to him, for the threat produced an immediate effect; the coward relaxed his hold, the reins dropped from his fingers, and with a mingled look of hatred and fear, he stepped back a pace.

The moment the bridle became free, the steed, already startled by the spur, bounded forward, and after half-a-dozen springs, both horse and rider disappeared behind the screen of the palmettoes.

I was too late to play the knight-errant. The 'ladye faire' had not needed my help; she neither saw nor heard me; and by the time I arrived upon the ground, she had passed out of sight, and Ijurra was alone.

CHAPTER L.

AWKWARD ODDS.

Ijurra was alone, and I continued to advance to the spot where he was standing. His back was towards me, for he still fronted in the direction in which Isolina had galloped off. He had followed her with his eyes, with a cry of disappointed rage, with a threat of malignant vengeance.

The sound of his own voice hindered him from hearing mine, and he was not aware of my presence, when I paused scarcely three feet from where he stood, and directly behind him. I held my sword drawn; I could have thrust him in the back, through and through again, before he could have offered either defence or resistance. He was completely in my power.

Fortunate was it for him at that moment that I had been bred a gentleman, else in another instant his lifeless body would have lain at my feet. A plebeian blade would have made short work with the ruffian, and I confess that my instincts of fair-play were sorely tried. I had before me a man who had sought my life—a deadly foe—a deadly foe to her I loved—a perjured villain—a murderer! With such titles for himself, he had none to the laws of honour; and I confess that for one short moment, I felt like ignoring his claim. 'Twas but for a moment: the thought revolted me. Wicked and worthless as he was, I could not stab him in the back.

I leaned forward, and tapping him upon the shoulder, pronounced his name.

It was the first intimation he had of my presence; and starting as if hit by a bullet, he turned face towards me. The flush of anger upon his cheek suddenly gave place to a deadly pallor, and his eyes became set in that peculiar stare that indicates an apprehension of danger. This he must have felt keenly, for my determined look and drawn sword—to say nothing of the surprise by which I had come upon him—were calculated to produce that effect.

It was the first time we had stood face to face, and I now perceived that he was a much larger man than myself. But I saw, too, that his eye quailed, and his lip quivered at the encounter. I saw that he was cowed; I felt that I was his master.

'You are Rafael Ijurra?' I repeated, as he had not made answer to my first interrogation.

'Sí, señor,' he answered hesitatingly. 'What want you with me?'

'You have some documents there (he still held the papers in his hand); a portion of them belongs to me. I shall trouble you to hand them over.'

'Are you Captain Warfield?' he asked, after a pause, at the same time pretending to examine the superscription upon the commissary's letter. I saw that his fingers trembled.

'I am Captain Warfield—you ought to know by this time?'

Without noticing the insinuation, he replied: 'True—there is a letter here bearing that address. I found it upon the road: you are welcome to it, señor.'

As he said this, he handed me the commissary's order, still retaining the other documents.

'There was an enclosure? I perceive you have it in your hand. I beg you will make me equally welcome to that.'

'Oh! a note signed Ramon de Vargas? It was an enclosure?'

'Precisely so; and of course goes along with the letter.'

'O certainly; here it is, señor.'

'There is still another little document in your possession—a safeguard from the American commander granted to a certain lady. It is not yours, Señor Ijurra! I beg you will deliver it to me. I wish to return it to the lady to whom it belongs.'

This was the bitterest pill I had yet presented to him. He glanced hastily first to the right and then to the left, as if desirous of making escape. He would fain have done so, but I kept him under my eye, and he saw that my hand was ready.

'Certainly there is a safeguard,' replied he after a pause, and with a feigned attempt at laughter. 'Tis a worthless document to me; 'tis at your service, sir captain;' and as he handed me the paper, he accompanied the act with another sorry cackinnation.

I folded the precious documents, and thrust all three under the breast of my coat; then placing myself in fighting attitude, I cried out to my adversary to 'draw and defend' himself.

I had already noticed that he wore a sword, and, like myself, it appeared to be the only weapon he carried. I saw no pistols upon his person. I had none myself—nothing save a light cut-and-thrust sword. It was far slighter than the sabre of my antagonist, but it was a weapon that had seen service in my hands, and I had perfect confidence in it. I had no fear for the result against so cowardly an adversary; I was not awed, either by his heavier blade, or the superior size of his person.

To my astonishment, he hesitated to unsheath his sword!

'You must draw,' I shouted with emphasis. 'You or I have now to die. If you do not defend yourself, I shall run you through the body. Coward! would you have me kill you with your blade in its sheath?'

Even the taunt did not nerve him. Never saw I so complete a poltroon. His white lips trembled, his eyes rolled wildly from side to side, seeking an opportunity to escape. I am certain that could he have hoped to get clear, he would at that crisis have turned and run.

All at once, and to my surprise, the coward appeared smitten with courage; and grasping the hilt of his sabre, he drew the blade ringing from its scabbard, with all the energy of a determined man! His reluctance to fight seemed suddenly to have forsaken him. Had I mistaken my man? or was it despair that was nerving his arm?

His cowed look had disappeared: his eyes flashed with fury and vengeance; his teeth gritted together; and a fierce *carajo* hissed from his lips.

Our blades met—the sparks crackled from the creasing steel, and the combat began.

Fortunate for me, that, in avoiding the first lunge of my antagonist, I had to turn half round; fortunately I turned so soon, else I should never have left that glade alive.

As I faced in the new direction, I saw two men running towards us, sword in hand. A single glance told me they were guerrilleros. They were already within ten paces of the spot, and must have been seen long before by Ijurra.

This was the key to his altered demeanour. Their

approach it was that had inspired him with courage to begin the fight, for he had calculated the time when they should be able to get up, and assail me from behind.

'Hola!' shouted he, seeing that I had discovered them—'Hola! El Zorro—José! anda! anda! Mueran los Yankies! al muerte con el picaro!'

For the first time, I felt myself in danger. Three swords to one was awkward odds; and the red giant, with a companion nearly as large as himself, would no doubt prove very different antagonists from the poltroon with whom I was engaged. Yes, I was conscious of danger, and might have retreated, had I deemed such a course possible; but my horse was too far off, and the new-comers were directly in the path I should have to take to reach him. I could not hope to escape on foot; I well knew that these men run as lightly as Indians, for we had often proved their capacity in that accomplishment. They were already too near. I should be overtaken, struck down, pierced, with my back to the foe.

I had no time to reflect—just enough to leap back a pace or two, so as to bring all three of them in front of me, when I found my sword clashing against their blades, and parrying their blows one after the other.

I can describe the unequal combat no further. It was a confused medley of cut and thrust, in which I both gave wounds and received them. I was wounded in several places, and felt the warm blood running under my clothes and over my face. I was wearied to death, and every second growing weaker and fainter. I saw the red giant before me with his hand raised on high. His blade had already drawn my blood, and was crimsoned at the point; it was about to descend with a finishing-stroke. I should be unable to parry it, for I had just exhausted my strength in guarding against a blow from Ijurra. My hopeless peril wrung from me a cry of despair.

Was it my cry that caused the blade to drop from the hand of my antagonist, and the uplifted arm to fall loosely by his side? Was it my cry that created the consternation suddenly visible in the faces of my foes? I might have fancied so, had I not heard a sharp crack from behind, and seen that the arm of El Zorro was broken by a shot!

It seemed like the awaking from some horrid dream. One moment I was battling, face to face, with three desperate men; the instant after, their backs were towards me, and all three were running as for life!

I followed them with my eyes, but not far; for at twenty paces off they plunged into the thicket, and disappeared.

I turned in the opposite direction. A man was running across the open ground with a gun in his hand; he was advancing toward the spot where I stood. It was he who had fired the shot. I saw that he was in Mexican costume; surely he was one of the guerrilleros—he had aimed at me, and wounded his comrade?

For some seconds, I fancied that such might be the case. Evidently he was bolder than any of the three, for he continued to advance, as if determined to attack me alone!

I placed myself in readiness for this new antagonist, taking a fresh grasp on my sword, and wiping the blood from my eyes, that I might the better receive him.

It was not until he was close to the point of my blade, that I recognised the long ape-like arms, and crooked mateless limbs of Elijah Quackenboss!

CHAPTER LI.

AN OFFICIAL BLACK-LIST.

The ranger, after delivering his fire, had not waited to reload, but ran forward with the intention of joining me in the hand-to-hand fight, though he carried

no other weapon than his empty gun. But this would have been an efficient arm in such hands; for, despite his unsymmetrical build, Dutch Lige was stalwart and tough, and would have been a full match for any two of my assailants, had they stood their ground. But the crack of the gun had set them off like deer. They fancied, no doubt, that a stronger force was near; perhaps they remembered the terrible rifles of the trappers, and no doubt believed it was they who had arrived to the rescue. Indeed, such was my own belief, until I saw the oddly costumed ranger bounding towards the spot.

A glance satisfied me that I owed my preservation to Lige's love of botanical science. A large globe-shaped cactus plant, bristling like a hedgehog, hung dangling from the swivel of his gun—it was thus carried to save his fingers from contact with its barbed spines—while stuck into every loop and button-hole of his dress could be seen the leaves and branchlets, and fruits and flowers, of a host of curious and unknown plants. He had been herborising in the woods; and coming by chance within earshot of the scuffle, had scrambled through the bushes just in time to spoil the *coup-de-grâce* intended by El Zorro.

'Thanks, Quackenboss! thanks, my brave friend! you came in good time: you have saved me.'

'But a poor shot I've made, capten. I ought to have broken that red devil's skull, or sent my bullet into his stomach; he's got off too easy.'

'It was a good shot: you broke his arm, I think.'

'Ach! 'twas a poor shot; the cactus spoiled my aim. You hurt, capten?'

'I am wounded, but not mortally, I think. I feel a little faint: 'tis only the blood. My horse—you will find him yonder—among the trees—yonder. Go, Lige; bring my horse—my horse!'

For some minutes, I was out of the world. When consciousness came back, I perceived that my steed had been brought up, and stood near. The botanist was bending over me, and binding up my wounds with strips torn from his own shirt. He had one boot on; the other stood by, full of water, a portion of which he had already poured down my throat, and with the rest he proceeded to bathe my temples and wash the blood from my face.

This done, I soon felt refreshed and strong enough to mount; and having climbed into the saddle, I set out for the rancharia, my companion half guiding, half leading my horse.

By the path which we followed, we should have to pass close to the hacienda and within sight of it; but night had come on, and the darkness would hinder us from being observed. It was what I now desired, though I had left the cerro with hopes and wishes directly the reverse. With a red gash upon my forehead—my uniform torn and blood-stained—I feared being seen, lest my invalid appearance should create unnecessary alarm. But we passed on without meeting any one, either by the hill or upon the main road, and in half an hour after, I was safe within my *caserío* in the house of the *alcaldé*. * * *

The incidents of the day preyed upon my spirits, and I was far from feeling easy about the future. I knew that my betrothed would be true till death, and I felt ashamed that I had doubted her, even for a moment. About her loyalty I had no uneasiness, and I mentally vowed never more to give way to suspicion.

It was no thought of that that now troubled me, but an anxiety about *her personal safety*; and this grew stronger the more I pondered upon it, till it assumed almost the form of a fear.

The man who had used such bitter threats, and behaved with so much rudeness, would scarcely stop at anything. 'Tis true I had deprived him of much of his power over her, by stripping him of the dangerous

documents; but it was not the time, nor was he the man to stand upon nice distinctions of legality, where jealousy and cupidity were the incentives to action. Holding a sort of irresponsible office as the chief of what was less a patriotic guerrilla, than a band of brigands, it was difficult to tell what such a monster might or might not attempt. In our absence from the post the ruffian would be full master of the neighbourhood. What deed might he not accomplish with impunity, holding his power directly from the unprincipled dictator, whom he was accustomed to imitate as a model, and who would indorse any act of villainy, provided it was the act of one of his own satellites. I shuddered as I reflected.

The reappearance of Ijurra and his band—for I doubted not that his followers were near—their reappearance in that vicinity, and at such a crisis—just as we were being withdrawn—had something ominous in it. They must have known ere this of the plan of campaign designed for the American army. Wheatley's rumour had proved well founded. The new commander-in-chief, Scott, had arrived upon the ground, and three-fourths of the 'army of occupation' had been draughted to form the expedition destined to act upon Vera Cruz. As this greedy general stripped our old favourite 'Rough and Ready' of only his best troops, we had the consolation of knowing that the 'rangers' were among the 'picked;' though, for all that, many of us would have preferred remaining with the brave veteran who had already led us so often to victory. I can answer for Wheatley and myself; I might also vouch for Holingsworth, though far different were his motives for wishing to remain on the Rio Grande. His sweetheart was revenge—in his breast long cherished—to his heart faithful and true.

I have said that our design must have been known ere this; indeed the army was already in movement. Troops and brigades were marching upon Brazos, Santiago, and Tampico, there to be embarked for the south, and all that were to go had received their orders. The provinces on the Rio Grande were not to be entirely abandoned, but the army left there was to have its lines contracted, and would therefore cover much less ground. Not only was our little post to be deserted, but the neighbouring town, which had long been the head-quarters of a division, was also to be evacuated. No force of our army would remain within fifty miles of the rancheria; and perhaps no American troop would ever again visit that isolated village. The reflection rendered me more than melancholy.

No doubt of it—the enemy was apprised of our movements. In our special case—that we the rangers were to march on the following morning—was well known to the people of the neighbourhood. It had been known to them for several days; and it had not passed unobserved by us that the citizens of the place—those who were not Ayankieados—had lately shewn themselves more sulky and inhospitable, in proportion as the time approached for our departure. This *brusquerie* had led to several street-conflicts, in which knives had been drawn and blood spilled, and much 'bad blood' begotten on both sides.

Another circumstance was not unnoticed amongst us. Ribald pasquinades, rudely written, and accompanied by threats of proscription, were at this time thrust under the doors of such of the citizens as had been friendly to us. Even the *alcaldé* had received some documents of this character—perhaps emanating from a jealous *tiendero* who had looked with bitter eye upon the courtship of Wheatley and Conchita. It was not till afterwards I learned that similar missives had 'come to hand' in a quarter that more concerned myself.

Some scouted the absurdity of these acts, alleging that they sprang from personal enmity, or originated in the mob-patriotism of the *leperos*. It was not so, as

I afterwards learned; the government of the country, or at all events, several of its prominent members, countenanced the meanness; and at their instigation, a 'black list' was made out in every town and village through which the American army had occasion to pass. Let the minister, Señor O—, make answer to this accusation.

I was musing on this disagreeable theme, after my return from the cerro, and endeavouring to sketch out some plan for the safety of my betrothed during my absence; but my thoughts proved barren. With a sort of faint hope that the villain Ijurra might yet fall into our hands, I had despatched Holingsworth—nothing loath for the duty—with a party of rangers upon his trail, and I was impatiently awaiting their return.

The voice of Wheatley aroused me from my reverie.

'Well, lieutenant, what is it?'

'Only that precious boy,' answered he, with a significant smile, at the same time ushering 'Cyprio' into the room.

The lad carried a note, which I opened. A green sprig of juniper was enclosed, and the simple word '*tuya*' was written in pencil. I knew the symbol well. The juniper is *tuya* in that most beautiful of tongues, and *tuya* from a lady signifies 'yours.'

'Anything more?' I asked of the messenger.

'Nothing, Señor Capitan,' answered the intelligent boy; 'only to inquire if you had arrived safe.'

She had been anxious then!

I separated the branchlet into two equal parts: one I placed in my bosom; the other, having fervently kissed, I enclosed in a folded sheet, upon which I wrote the words:

'*Tuyo—tuyo—hasta la muerte!*'

Cyprio bore back my parting message.

At midnight, Holingsworth and his party came in from the scout. Nothing had been seen of the guerrilla.

PROGRESS OF TASMANIA.

ENOUGH has been said of late about the Australians by all manner of people; but as we do not often hear anything on the subject from themselves, here follows a brief summary of what the inhabitants of the Britain of the South, as they fondly call Tasmania, have thought proper to print concerning their own position and prospects. Let us just remark, in passing, that we find no fault with this ambitious appellation; for the island, like our own, has picturesque scenery, excellent harbours, climate and soil suited for agriculture, forests of fine timber, and unlimited deposits of coal, iron-ore, limestone, and so forth.

In March 1851, the total population of Tasmania was 69,187, of whom 34,070 were adult males; 15,996 adult females, and 19,121 children of both sexes. This was about two months before the surprising gold discoveries in the neighbouring colonies, and we see at once what were the consequences. The arrivals during the year numbered 6076; the departures, 6613. In 1852, the arrivals were 15,203; the departures, 21,917. In 1853, there was a pause in this process of depopulation: 14,977 persons came to the island, and 12,684 left it. At the end of this latter year, there was a positive decrease of 23 per cent. in the number of men, and a very sensible disturbing influence on the social and domestic condition of the colony was the result. On the other hand, the number of children had multiplied from 27 per cent. in 1851, to 36 per cent. in 1853—the germ of future increase.

Not less marked is the effect on matrimony: in 1851, the number of marriages was 992; 1213 in 1852; and 1479 in 1853, when the number of the adult

population, as seen above, was much diminished. Who does not see in this the return of fortunate diggers from the gold-fields eager to find wives to share their sudden wealth?

We take a look at the convicts: of these, the servile class of the colony, there were, of both sexes, in 1851, 20,069; in 1852, 19,105; and in 1853, 16,745. Here we observe the effect of Her Majesty's Order in Council for the stoppage of transportation to Van Diemen's Land; the number decreases rapidly, and by the time the next census is taken, there will probably be no convicts as a class to enumerate. We find that in August 1854, the total number of convicts was 13,456; of whom 10,174 were earning their own living, and 3282 only were maintained at the government cost. An estimate was then made—the verification of which we have not yet heard of—that 10,000 would be released from their convict condition in April 1856; while of the remainder, more than half would live by their own earnings. In 1854-5, the estimates for convict expenses were £205,385; and £132,553 in 1856.

Trade and commerce exhibit returns still more striking. In 1851, the value of the imports was £641,609; in 1852, £860,488; in 1853, £2,273,397; an amazing increase, being at the rate of £34, 9s. 4d. per head of the population—an increase only exceeded by that of the colony of Victoria. The exports for the same years amounted respectively to £665,790, £1,509,883, £1,756,316.

The whale-fishing declined wofully in the same period; from 40 colonial and 9 foreign ships, down to 7 and 2; adventurers, instead of chasing leviathans across the ocean, preferred the enterprise and excitement of digging for nuggets. The timber-trade, on the contrary, comes out bravely. In 1844, the value of timber exported was £3577; in 1853, nearly half a million. The trade suffered, as did many others, in 1851, being £23,000 under 1850; but the demand for boards, planks, joists, &c., to shelter the thousands of emigrants who poured into Melbourne, sent it up to £89,000 in 1852, and to the much greater sum in the following year. This was something like prosperity. It lured back to the Tasmanian forests many of the gold-seekers, who found that the gold-fields were, after all, less profitable, and much more precarious, than the rewards offered to steady labour in felling and sawing timber.

Agriculture suffered by the departure of all the farm-labourers who could get away; excepting potatoes, the exports in 1853 were not more than one-seventh of what they were in 1851. By the side of this decrease, it is remarkable that there is no decrease in the quantity of wool exported. There was also a slackening in ship-building, yet the number of steamers plying in the colony increased from two to five.

As regards money, the whole amount of coin in the banks and military-chest, in 1850, was £239,417; in 1852, it was £621,419; and in 1853, £1,375,352—all exclusive of bills of exchange and paper-currency. Taking the average of the population, the bank deposits in 1853 amounted to £28, 8s. 10d. per head.

The penny-post experiment has proved not less satisfactory at the antipodes than here: the penny rate within the colony and compulsory pre-payment were established in 1853; and in that year the receipts were £9880, while in 1852, they were £8308.

Among industrial resources, we find sixty different trades and manufactures carried on in the colony, and here something occurs as to the rate of wages. In 1851, the daily pay of carpenters, masons, and bricklayers was 5s.; in 1853, it was 15s., and a similar increase prevailed in all other trades, somewhat higher in towns than in the country. Simultaneously, there was a great rise in the price of provisions—500 per cent. in some instances; and we are informed that the

trebling of wages was 'not so very unreasonable when compared with the enhanced cost of provisions, fuel, and rent, and, indeed, of every article of consumption; and it may be affirmed that a mechanic with a family was much better off with his ordinary wages in the cheap times.'

Again: with the first rush to the Diggings, house-property sunk so much in value, that it could only be sold with difficulty at a nominal price. 'But ere long the streets of Hobart Town and Launceston began to swarm with lucky diggers and numerous visitors—the former bent on enjoying the fruits of their success with their families and friends, and the latter to take up their abode more or less permanently, attracted by our superior climate, and our more quiet and better protected towns.' The consequence was a scrambling for houses, and a rise of 400 per cent. in rents. The number of houses in the colony in 1848 was 7629; in 1851, it was 11,844.

Just one word about the climate, by way of conclusion. The mean temperature near Hobart Town, deduced from ten years' observations, is 52°81; and the mean rain-fall for the same period nearly 21 inches annually, which differs but little from the mean annual rain-fall of London.

The Britain looked down on by the Southern Cross is thus seen to afford matter for reflection and instruction to the Britain over which the Great Bear casts his eye. In addition to the points of resemblance enumerated at the outset, the former has a Royal Society, active and learned, from whose *Proceedings* the facts and particulars have been derived for the present article.

LIFE RETURNING;

AFTER WAR-TIME.

O life, dear life, with sunbeam finger touching
This poor damp brow, or flying freshly past
On wings of mountain winds, or clasped fast
In links of visionary embraces, clutching
Me from the yawning grave—
Can I believe thou yet hast power to save?

I see thee, O my life, like phantom giant,
Stand on the hill-top, large against the dawn;
Upon the night-black clouds retreating drawn;
In aspect wonderful, with hope defiant,
And so majestic grown,
I scarce discern the image as my own.

Those mists lift off, and through the vale resplendent
Behold the pathway of my years prolong!
Not without labour, yet for labour strong;
Not without pain, but pain sublimed, transcendent,
That by divinest laws
Heart unto heart, and all hearts upwards, draws.

O life, O love—your diverse tones bewildering
Make silence, like two meeting waves of sound,
And force a lull in this world's noisy round:
I dream of wifely white arms, lip of children—
Never of ended wars,
Save kisses sealing honourable scars.

Peace! No more battles: save the combat glorious
To which all earth and heaven do witness stand:
The sword of the spirit taking in my hand,
I shall go forth, for in new fields victorious
The King yet grants that I
His servant live, or His good soldier die.

PRICE 1d.

THE FICTIONIST'S WORLD.

Fictionists usually profess to paint the world as it is—to 'hold the mirror up to nature;' but it is certain they do not, and highly doubtful whether they could. It seems to be felt as necessary in a novel to assume the existence of men both better and worse than are commonly found in the ordinary world; also, that the reader will approve of views in social philosophy contrary to those he sanctions and acts upon in his daily life. The matter appears puzzling at first, for one would *a priori* suppose that a true counterfeit presentment of life was most likely to give the amusement which we look for in a work of fiction. Account for it as we please, the fact undoubtedly is so, that there is a traditional set of characters for the drama and the novel, readily recognisable as such, and standing quite apart from the actual people we meet with in society; likewise, a peculiar way of treating them and making them work, as conventional as common life, but considerably different.

Everybody will at once understand what is here meant, after he shall have seen a few illustrations.

In the actual world, as we well know, there is always a presumption in favour of people of wealth and station. If a society of a philanthropic nature is looking out for a set of directors whose names may give it respectability, it does not willingly adopt poor or obscure men. It takes men who are known to stand well with their bankers. If the said directors are called upon to consider the cases of certain applicants, whose certificates will they regard as the most to be depended on? Not those of poor obscure people, but those of men of substance and social distinction. When individuals of any rank whatever are choosing guardians for their children, or trustees to manage their estates, do they choose the poorest of their acquaintances for the duty? No, they select the very richest friends they have. Even in a case of evidence as to a simple matter of fact, suppose a gentleman testifies to one thing, and a poor person to another, shall we not find that the former is preferred almost without a moment of hesitation? Now, I think it may be fairly assumed that men would not proceed upon these principles in matters affecting their interests, unless experience had satisfied them that the principles are correct, and consequently safe. It is not that every poor man is held as necessarily dishonest or unvarnished, or every rich man the reverse. We can readily understand it to arise from simply this consideration, that, supposing the natural tendencies of rich and poor to be equal, there is an influence in education, exemption from small temptations, fear of disgrace, and other circumstances, as affecting the

wealthy, which is not to be looked for in equal force among the poor—and no discredit to them that it is so.

With the novelist, all this is reversed. In his narrative, the presumption is always in favour of the poorer party. Ten to one, the rich man is a grasping oppressor, and the poor one a noble fellow, a pattern of all the virtues both of his own and other classes, only unfortunate in suffering unjustly under his long-pursed neighbour. Very often the whole interest of the story depends on bringing some paragon of righteous poverty through frightful difficulties placed in his path by iniquitous opulence. I do not say that such circumstances are impossible, or that they never occur; I do not profess either to extol the rich or depreciate the poor. I merely remark, that when men of any grade whatever deliberate for a selection of persons to be intrusted with any important charge, they act upon an assumption exactly the opposite. They judge of men as bankers judge of them, which is precisely the reverse of the way they are judged of by the fictionist.

The fictionist makes a kind of acknowledgment that wealth is regarded with deference in the actual world, but sees in this nothing but a mean spirit of mammon-worship. Very likely, in his own actual life, he finds that poor friends are able to do him little service, and very often require loans from his purse, if he has one; while rich people give good dinners, are surrounded with objects gratifying to good taste, never require to lay his purse under contribution, sometimes can say a good word for him with dispensers of patronage, and are altogether persons whom it is useful to him to know. Such are, at least, the experiences of ordinary mortals in the world, and, while they have needs and appetites, they will continue to be actuated by such considerations. One does not see, in actual society, any great occasion to declaim about a matter so simple and so natural. In the novel, however, it is a great and prevailing sin, never enough to be condemned. There the writer who himself practises it, turns it into every conceivable form of ridicule for the gratification of readers who never think of acting upon any other principle.

And see how this works itself out in the special characters. In the real world, we are continually meeting with self-raised men, who display cultivated taste and good-manners, and who make a generous and rational use of their wealth. You will generally find, too, in such men, a moderation of tone in perfect keeping with their original humility, and anything but a disposition to overlook or slight old friends. In the novelist's world, I need scarcely remind you how the new rich man is described—from M. Jourdain to

Mr Bounderby, nothing but a vulgar, purse-proud fool. This is the more unreasonable, since there is nothing the fictionist is more solicitous about than to bring windfalls of fortune to poor men. Are we to understand that men are only respectable while poor, and become fools and tyrants when enriched. If so, can our novelist be justified in enriching anybody?

It seems specially the delight of fiction to take up merit in lowliness and distress, and exhibit it pressing on through all difficulties to brilliant results. An obscure and nameless adventurer, who can sketch, and has no letters of introduction, that is the type of a novelist's favourite. He becomes prescriptively interesting in appearance, and by right of ancient usage, obtains, at a first and chance interview, the affections of the nasty rich gentleman's daughter. In actual good society, it is universally held as very naughty conduct in a young lady, when she opens her ears to lovers unrecognised as respectable persons by her papa and mamma; and there are plenty of reasons in morals and good taste why this view should be taken of the case. But in fiction, it seems to be supposed that nothing else will excite sympathy and interest. There, an approvable, above-board lover, who was making £1500 a year at the bar or as manager of a company, would never do. I have sometimes thought of making a collection of all the Belvilles, Altamonts, and Delacours who have been the heroes of novelists from first to last, in order to see if there was a single quality or circumstance about any of them such as a decent father might, could, or should have approved of. My belief is they would have all been found wanting in the first elements of eligibility. If such be the case, it is a mere mockery to ask gravely if fiction can be considered as representing human life.

Perhaps we may go a little further, and say there are connections of characters and circumstances frequently occurring in actual life, but which, though they are by no means devoid of interest in their own way, fiction never has taken, and never will take up. In the annals of law-courts, it is quite as common for the poor as for the rich man to be in the position of a persecutor. A man in difficulties imagines himself possessed of some claim upon a neighbour of substance, or, what is quite as serviceable, sees some chance of turning a quirk of the law in his favour, against the said neighbour, so as to extort a sum of money. With the aid of some inferior practitioner, he will raise an action, and put his substantial adversary to no small trouble and expense, not to speak of irritation of mind. Here there is a necessary injustice on the side of the plaintiff, for, whether he loses or gains his action, he will pay nothing, having nothing wherewithal to pay; so that the opposite party must at least lose the amount of his expenses. Such things occur every day, being simply speculative assaults of one set of men upon the property of another; and it is obvious that they must often involve curious circumstances, and many distressful emotions. But fiction knows well that any such case in its pages would wholly fail of effect.

Fiction, then, is not and cannot be a true reflex of life. Nor are the reasons, perhaps, discreditable either to the writers or their readers. In the actual world, we must be guided by worldly rules and maxims, or we perish. There is therefore no thought of a practical dissent from our social morality. But we at the same time see in social things much that leaves us unsatisfied, and the accidents which make one man rich and another poor, are of the number. We are all glad, occasionally, to be rapt away into an ideal world, where good is dealt out on a different principle, where obscurity is no impediment to merit, where the woes of poverty are redressed, where natural qualities, albeit external, assert a superiority over those which fortune has conferred, where the conventional is over-

ruled by the impulses of the heart. It refreshes us to be made, even for a moment, to believe in such a system of things. For, though we may in reason acknowledge that, on the whole, things are well ordered in this world, still the evils that remain unremedied, and which, apparently, can never be wholly avoided, make a painful impression on us. Fiction, as by a charm, puts all to rights. It gives us the scheme of providence we should ourselves have chosen. Here, at least, we are at liberty to act—for we act with the actors—as our best feelings would dictate, however otherwise our practice must needs be in the real world.

GLIMPSES OF AFFAIRS IN AMERICA

WHAT IS TO BE DONE?

The reader has been conducted through a history—such as it is—of American slavery, and been made acquainted with some prominent features in its character. He perceives that, as a carefully nourished institution, it imparts a tone to the whole social system of the United States, interweaves itself with the national constitution, laws, usages, sentiments, the most vital principles of public polity.

Though marvellous in many respects, this institution has not seemingly attained its full proportions. It is still growing. Sixty-seven years ago, under a million—now approaching five millions—soon there will be ten millions of human beings in the condition of 'chattels personal'—a nation of slaves within a nation of freemen, a people dangerous in their numbers and sense of wrong, dangerous as an engine of intestine discord, in the event of hostilities with an unscrupulous foreign enemy.

Can no practicable measures be devised to arrest this monster evil in its desolating course? We may be better able to reply to this inquiry after glancing at the causes which have conspired to bring about present results.

First, and at the foundation of the whole mischief, lie the provisions of the federal constitution, which, as formerly shewn, pledge the whole states to maintain slavery inviolate in any individual state where it exists—which authorise a method of representation in the House of Representatives, based on a certain numerical proportion of slaves; whereby the southern faction gains thirty votes—and which, by giving national efficacy to a fugitive slave law, bring the whole country within the operation of southern institutions.

Practically, the constitution of the United States is incapable of change. To amend it, there would need to be a very effective rousing of public feeling throughout the various states. Congress must be besieged with petitions—which would have little effect, constituted as that body now is. Supposing this difficulty to be overcome, a proposal for amendment must be concurred in by two-thirds of both branches of congress—hopeless. Supposing this difficulty also overcome, conventions to take the matter into consideration must be called by the legislatures of the several states. Lastly, the decision of the conventions must be ratified by three-fourths of the states; by which is inferred the consent of six of the slave states—hopeless. To all appearance, therefore, reform is constitutionally impossible.

Second. With such constitutional advantages in its favour, as well as by superior address, the southern party has obtained such political supremacy, as enables it to secure northern votes. Having thus a majority in congress, it has from time to time, by legislative measures, extended slavery over newly acquired territories; and judging from recent elections, it has now a greater power of doing so than ever.

Third. Northern selfishness, by which freedom and

independence are bartered for place, pay, commercial monopoly, and other material interests.

Fourth—although this might almost be placed first—There is the universal desire to support the Union, which, having attained great eminence and glory, is, right or wrong, idolised to a very extraordinary degree.

Fifth. Fears of destroying this object of worship, along with the blinding effects of political partisanship, produce a Public Opinion that acts despotically in suppressing freedom of speech; wherefore, all who express a detestation of slavery, and agitate for its restriction or extinction, are proscribed as 'abolitionists'—a name, in popular acceptance, synonymous with everything that is infamous.

Sixth. The propagation of corrupt doctrines by religious teachers of almost every denomination, to the effect that slavery is an institution beneficently designed by Providence for the spiritual welfare of its victims. And along with this agency may be classed the dissemination of pro-slavery sentiments, and the ridicule of anti-slavery efforts, by a great part of the press, which takes its tone from Public Opinion.

Seventh. The prejudice respecting colour throughout the greater part of the free states; and the notion, generally, that the negro is from nature of an inferior and servile race.

Eighth. The continually growing demand for cotton, before which every consideration of humanity, or dread of consequences, disappears.

Some other causes might be assigned; as, for example, party violence by mobs at elections, by which quietly disposed and respectable persons are driven from the field of politics, and power handed over to those who aim as much at selfish ends as the public advantage. And then, to account for these scenes of violence, as well as for much newspaper abuse, we might allude to the strange practice of discharging almost all government-officers and appointing new ones, according to political changes, by which a state of disorder is kept up in the country by all classes of office-seekers.

Out of this complication of causes, we leave any one to say how American slavery is to be alleviated. Congress has only a power of restraining it from entering the territories—and even this power is not undisputed. Slavery can be legally abolished only by the separate action of each individual state; and within each slave state there exists a dominating power, apparently impervious to any reasonable proposition on the subject. Not even the respective legislatures of these states could relax the slave code, without a very general consent of the people. In the matter of slavery, Vigilance Committees are above all law. And measures for emancipation, supposing them attempted, might be followed by revolution.

It is not to be supposed that an evil so conspicuous, so fraught with probabilities of mischief, and, to say the least of it, so damaging to the character of those by whom it is cherished, should have escaped the notice of Americans. But unfortunately, it has never attained the position of a public or generally discussed question—it seems as though an impression prevailed that nothing could be made of it, or that for certain reasons it was improper to speak of it at all. Slavery, in short, is a kind of tabooed subject in the States. It is not an agreeable thing to think of, certainly not to talk about.

When tourists, in their curiosity to arrive at the truth, refer to this grievous evil, they find little to put in their note-book. The best they get is the pious remark, 'that slavery is one of those sad evils which will doubtless pass away in God's own good time.' And, thus, worthy people consoling themselves with a highly edifying sentiment, go placidly to sleep, and leave slavery to take its chance. It must be deemed

odd that this great people, renowned for their shrewdness, should for any reason shrink from the open discussion of a social question which so intimately concerns their welfare. 'Abolition' haunts them like a spectre. Let us have a look at this terrible apparition.

A number of years ago, there sprang up anti-slavery societies, differing considerably in their views. Some of the older associations have disappeared, others with more vitality have become permanent. The American Anti-slavery Society, located at New York, takes the lead among existing institutions. Massachusetts has several associations in vigorous operation, the chief one, as we believe, being called the Massachusetts Anti-slavery Society, which began in 1832, and holds annual festivals of much oratorical importance. This society was formed 'on the ground of the Absolute Sin of Slaveholding, and the Duty of Immediate and Unconditional Emancipation.' The president is William Lloyd Garrison; and among the office-bearers or adherents are other leading abolitionists—Wendell Phillips, Samuel May, Edmund Quincy, Maria M. Chapman, Lucy Stone, Lucretia Mott, and Theodore Parker. The abolitionists, represented by these and similar societies, will make no compromise on the subject of slavery; nor do they design to work through religious or political organisations. They declare, there is an inherent wickedness in slavery, with which there can be no association. It is not clear to us from their writings what is their plan for effecting 'immediate emancipation.' We presume, they merely insist that the whole of the slaves should be instantly liberated, without compensation to owners, and without any preparation, educational or otherwise, for the enjoyment of freedom. A number of the members are Non-resistants—a class of persons who repudiate the federal constitution, and decline to take any part in elections. Those who entertain these ultra views, desire to dissolve the Union, in order to be entirely rid of any connection with the South.

Next comes the Liberty party, which also advocates immediate emancipation, but does not think so badly of the constitution, and accordingly is opposed to a dissolution of the Union. Its members do not withdraw from their church relations, on account of slavery, and hope to effect their purposes by moderate means. Many of the party are connected with societies, which rely on the diffusion of religious knowledge in the South as one of the best plans for promoting anti-slavery sentiments in that quarter.

We believe the Liberty party is now pretty nearly swallowed up in the new Republican party. Europeans have heard much lately of the Republicans, and it is interesting to know what really is their anti-slavery doctrine. Properly speaking, they are not abolitionists at all. No doubt, many members would wish immediate emancipation, and their papers and orations in favour of liberty are unexceptionable. But the members generally are only Free-soilers. They disclaim any intention of meddling with slavery where it exists, and will be satisfied with seeing it kept out of the territories, which would doubtless be a great point gained. They do not advocate a dissolution of the Union; though it is not unlikely, should other projects fail, that they will come to that. They have confident anticipations of carrying Fremont as president in 1860, and live on in this hope. To this great political organisation belong Charles Sumner, Hall, Giddings, Chase, Henry Ward Beecher, Seward, and Horace Greeley.

Finally, we might mention the party called Union-savers, represented by Fillmore, who look upon slavery as a bad thing in principle, but deprecate all agitation on the subject. By lending themselves politically to the democrats, they sink the question of slavery altogether, and serve materially to impose that restraint

on free opinion which is so injurious to the cause of freedom.

It will be observed that among these parties there is only one entitled to be called true abolitionists; all the others postponing the question of emancipation, or subordinating it to certain political and religious considerations.

As a reason for persecuting abolitionists, it has been alleged that their object is to stir up mischief in the South; that by means of tracts and other agencies, they endeavour to spread incendiary doctrines, and place the owners of slaves in constant danger of insurrection and loss of property. It is further alleged, that the laws against teaching slaves to read, are a consequence of these attempts to promote discontent through the press; and that the proceedings of abolitionists generally having greatly exasperated the slaveholders, the condition of slaves was now very much worse than if there had been no abolition movement. There is perhaps some truth, but also some error, in these statements.

It may, we think, be candidly admitted that the ultra-abolitionists—like the old English Puritans and the Scotch Covenanters—take extreme views of the subject, are rather intractable, and from conscientious but not extensively appreciated motives, do not scruple to denounce what they consider to be a great national sin. Thus, they give offence. Their language is occasionally coarse and irreverent. For example, one of Garrison's common expressions is, that 'the United States constitution is a Covenant with Death, and an Agreement with Hell'—an abuse of Scriptural phraseology not exactly accordant with modern notions. It may be also allowed that the anti-slavery cause has been sullied by unseemly party differences, and that, assuming the worst qualities of sectarians, its adherents have too often demonstrated a spirit of intolerance and persecution.

Whatever may have been the opinions entertained respecting abolitionist doctrines, the time has come when they must be spoken of at least in terms of extenuation. The occurrences of the last twelve months have immeasurably advanced the anti-slavery cause in the minds of Europeans; and we may add, that on the relative situation of abolitionists and slaveholders a new and more distinct light has been thrown. The recent declaration by leading organs in the South, that slavery was there and there for ever—that no plan of emancipation would be listened to—that slavery is a natural and proper institution—that free society has been a failure—that the whole free coloured and poor white population of the States should be reduced to perpetual bondage—that the foreign slave-trade ought to be revived—together with eulogies on slavery by the Governors of a state, and also by a President of the United States—declarations by the highest authorities that there is an inherent vitality in slavery which will insure its illimitable growth; and a distinct avowal of the design to absorb new countries for the sake of protecting and greatly extending the institution—these extraordinary announcements, along with the unprovoked and unredressed outrages committed by Missourians in Kansas, the brutal assault of Brooks on Mr Sumner, not to speak of other barbarities, defended and gloried in—all this, we say, entirely alters the aspect under which we are to view the operations of the abolitionists. As long as the world was under the impression that a calm consideration of emancipation was postponed in consequence of the intemperate harangues of what were deemed a body of fanatics, the slaveholders commanded that degree of sympathy which was thought to be due to their undesired and very unfortunate situation. But now, with the facts before us, we are at a loss to see how the matter is to be treated in the same indulgent spirit.

Lamenting the past rudeness with which abolitionists

have pressed their opinions—believing they would have more successfully promoted their aims by using milder persuasives—persons of enlarged views will join us in looking beyond the Faneuil Hall and Exeter Hall aspect of the anti-slavery cause. This cause is not to be regarded merely as it affects the blacks, but the whites—not merely the South, but the North—not merely the United States, but the whole family of mankind. All the communities on earth are interested in the solution of this mighty question—which, like other social questions of any consequence, has had to pass primarily through the hands of agitators who care little for conventional respectabilities. The question, we apprehend, has now got beyond the narrow sphere of anti-slavery societies. Supposing that the whole of the associations were dissolved and done with, that no such men as Garrison, Wendell Phillips, or Sumner were in existence, we return to general principles, and hope it will not be thought intrusive, if we ask the American people to be so good as explain, *what they propose to do with four millions of negro slaves and their progeny?*

Abolition principles are said to be making progress in the North. The protracted struggle in Kansas affords evidence of a desire somewhere, to outflank slavery on its own ground. Still there is a universal disinclination to meddle with southern institutions. Admitting that an important end would be gained by excluding slavery from Kansas, is there not the great south and south-west at disposal? From Texas and New Mexico, a number of new slave states may be carved out. We are aware that by the more sanguine class of American writers, it is confidently believed that Mexico, peopled as it is by mixed breeds hostile to American usages, will form an impregnable barrier to slavery in the south-west. How like one of the delusive fancies ordinarily indulged on the subject! With power in the hands of the pro-slavery party, and under a pressure for labour, the absorption of Mexico, Central America, and Cuba, is only a question of time and expediency. The very mixture of breeds in Mexico invites aggression. To meet the growing scarcity and costliness of negroes, there lies in that doomed country ample material at hand, ready for seizure and interstate deportation. For anything the present generation can tell, the South, Mexico included, may, some hundreds of years hence, form a great free republic of blacks, the refuge of oppressed colour. Such, indeed, is likely to be the case; but before that era comes round, what suffering, what convulsions, what bloodshed!

Slavery, we repeat, is seemingly destined to push far beyond its present limits. Is no check practicable?

The Constitution—it can do nothing.

The Republicans—they possess little political power; and, besides, they propose to act solely through the constitution.

The North—the majority of its representatives faithless; confidence in politicians gone.

The Anti-slavery Societies—a scattered body, with unfashionable views, and no political weight.

Enlightened Opinion—suppressed by mob violence and outvoted; the less opulent and more numerous classes being democrats, and supporters of the slave power.

The South—resolute in maintaining its institutions, and master of the situation.

Patience: the next decennial census will add to the number of members in congress from the free states; the free states will be increased in number by Minnesota, Nebraska, Oregon, and Washington—perhaps so much the worse; more democratic votes, more political manœuvring, more slavery?

There exists a hope of modifying slavery, by a diversion of the cotton-trade from America, and by a removal of protective duties. A falling off in the

demand for American cotton, by lessening the demand for negroes, would affect the slave-breeding states, and dispose them to adopt freedom. By the removal of protection, the present compact between North and South would be greatly shaken. The former point is for the consideration of Englishmen; the latter for that of Americans.

There is another hope to which we may call attention. It is the possibility of creating a free state in Western Texas, by means of the German and other European immigrants who have settled in that slave section of the Union. Whether the Free-soilers may here be able to outflank slavery, is doubtful; but the attempt will be made, and the people of England need not be surprised to learn that the outrages by slaveholders in Kansas are re-enacted on a scale of greater desperation near the shores of the Gulf of Mexico.

We would not willingly resign our faith in the capacity of Americans for overcoming dangers and difficulties. They possess a wonderful power of rallying when things are at their worst. Some grand movement, inspired by virtuous indignation and despair, may dislodge the oligarchy which controls public policy on the slave question. New Washingtons, Franklins, and Quincey Adamases may arise, to sustain the cause of freedom, now basely pronounced to be a failure. It is consoling to know that sudden and unforeseen changes for the better take place in the social as in the physical atmosphere. Luther's reformation was precipitated by the sale of some paltry indulgences. The fear of abolitionism, which now, like a superstition, hangs over the United States, preventing the dispassionate consideration of a subject of momentous concern, may, from some unforeseen cause, be speedily and happily dispelled.

Looking at matters as they stand, however, making every allowance for contingencies, we sorrowfully admit that these events do not seem probable. To be quite plain: there appear—at least on the surface—to be but two expedients, by which this fearfully embarrassed question is to be solved—Revolution, Insurrection, both to be earnestly deprecated.

Lately, apart from the old-school abolitionists, there have sprung up societies in Massachusetts and other quarters, with the distinctly professed object of dissolving the Union; in order that the free states may no longer be associated with, or made responsible for, slave institutions. Which states are to be disunited, these societies do not mention; that apparently being left to chance. They expect to operate through petitions to congress—hopeless. The law, under the constitution, by peaceful means, is against them; and with the universally prevailing respect for the Union, which with Americans is a kind of sub-religion, we do not imagine that the doctrines of the Disunionists will meet with wider acceptance than those of the Abolitionists, of which they are only a new version.

By writers who have taken notice of this new movement, Disunion is disapproved of, on the ground that if effected, slavery would be maintained with greater vigour in the South; they even speculate on the probability of some millions of abject whites in the southern states being made slaves. We think differently. The withdrawal of the northern states from the confederacy, whether peacefully or by armed force, would so shake and weaken the whole fabric of southern institutions, that an insurrection by the slaves would be inevitable—slavery would dissolve in a sea of blood.

The South knows this. It has often, in its vaunting and reckless mode of speaking, threatened to quit the Union. Let it try.

Feeling its power, the North, if true to itself and animated by higher motives, could in a short space of time extinguish slavery. It could say to the South: 'Unless you proceed to follow our example, and make

provision for the gradual emancipation of your slaves, the partnership between us must be dissolved; we must quit the confederacy, and be to you in future a foreign country.' A resolute but friendly address in these terms from an aggregate convention of free states is what civilisation would point to, instead of a resort to arms. But what a glow of patriotism—what an arousing of sensibilities—what a casting forth of selfishness—what a disruption of venerated traditions—what an enlightening of the masses—must ensue before the North assumes this grand attitude! It will not do so. The execution of the threat would be Revolution.

A declaration of independence by Massachusetts, or any other single state, is equally, if not more improbable; for that would be equivalent to civil war—an issue not likely to be contemplated. We would not, however, say, with any certainty, that Massachusetts would tamely submit to a very lengthened repetition of the indignities to which it has latterly been subjected by federal agencies. Spectators at a distance wait with some interest to see which is to be the last outrage that is to revive the spirit of Bunker's Hill.

The consideration of pacific adjustment being deliberately rejected, and Disunion, Revolution, or Civil War abjured—the case is not mended. Slavery goes on uninterruptedly in its course. The sore spreads, festers, and the longer a corrective is delayed, the disease becomes worse, the danger more imminent.

One trembles at the fatal alternative: Revolution—Insurrection. Can insurrection be avoided either way? Revolution would produce insurrection. Successful insurrection would be followed by revolution; for we can scarcely expect that the North would remain in union with a nation of blacks.

But while the whole federal power may be brought to suppress revolt, how can the slaves be successful in insurrection? War with one of the great European powers would furnish the means at once! God forbid that we should advocate such a crisis; but the history we have been tracing leads the mind, however reluctantly, to such a possibility; and it is impossible to avoid seeing that events are within the range even of probability which would render insurrection, if it occurred, not only formidable, but successful. If these pages awaken, before it is too late, some of the more powerful minds of America to the catastrophe to which, in the eyes of dispassionate observers, the history of their country seems tending, I shall not have written in vain.*

W. C.

THE SOFT-HEARTED POSTMAN.

VERY true, sir, as you say; there are many more young lads employed as postmen than a few years ago. But how can you wonder at it, when you consider how the business has been degraded, sir! How could it be expected that men like me, who for years have taken an interest in their business, should be content to shove letters into boxes at the very doors that used to open so briskly to them! No, sir, it was more than my human nature, at anyrate, could stand; and, bad as trade is, I'd fifty times rather die selling greens and new-laid eggs—when I've got them—than go rat-tatting down the street putting letters into boxes!

Well, sir, I can't see the saving of time, always excepting the houses of the haristocracy, and pretty nigh all them had boxes before the general order was issued. But I don't mean them. Where I felt the injury

* The reader having now before him the salient points of a very important question, we must refer him for the rest of the author's speculations, and the statistics that bear upon the subject, to a volume just published, entitled *Slavery and Colour in America*, by William Chambers, author of *Things as they are in America*, &c.

of the boxes, was in the comfortable easy-going kind of houses, or in the four delivery-a-day districts; pretty houses that kept their two or three servants, yet where the young ladies weren't too high to rush to the door before the servant could come and take the letters. Bless you, sir, boxes ain't no convenience at such houses; I was never kept waiting; and you'll see the difference of putting letters into a pretty white hand, which often belonged to a sweet face, and shoving them into a hole. Ugh! no wonder I couldn't stand it!

Yes, sir, I thought you'd understand the feeling. Besides, when a man has been long on one beat, he soon gets to know the sort of letters that are liked best, those that one doesn't care for, and those blue, thin, common papery ones that people would much rather be without. A man who takes an interest in his letters even gets to know certain handwritings; and when I was a young chap—not bad-looking either—many's the turn I've given the pretty faces watching me round a square. If I got in my sorting a letter, the very brother to lots I had been delivering at one house for a month past—bold free writing, but with a loving touch about the name, *always* Miss, and a fine firm seal—I used to put it last in my packet, and go past the house where a pretty face was watching me behind the blind, and so right round the square. When I got back, the pretty face was still watching me, only with an anxious clouded look; and then I'd give a start, and run up the steps, as though I had just discovered it; and the door would open suddenly before I reached it, and—oh, how I did long to stop and see her read it! But one grows softer-hearted as one grows older: at least I did.

Oh, of course, sir, we are not always welcome; and many a time I have seen calm faces that did not seem expecting anything, change to such a deadly pale, when I handed in a black-edged letter. I had a habit of touching my hat at such times; *they* didn't often see it; but it did no one any harm, and used to do me good, I think. Then, as I grew older, and saw a face at the window that couldn't bear much waiting, that looked *real* anxious, I got into a way of not looking at her if I had letters for the house, and not *the* one. If I did not look at her, I had to wait till the servant came; but if I looked up quick, I used to hear the little feet come through the hall; and sometimes I got what I've heard called a grateful look—and yet I didn't write the letters. Of course they weren't all so kind as that. Some used to take the letters as though they were pieces of wood. I've heard the feet come flying along the hall, and then the door would open slowly, and the letter be received as if it were no manner of consequence. Well, of course, I had my laugh at that when I had got away. No, the only boxes I knew at such houses were Christmas-boxes, and capital ones they were, and given cheerfully too. I suppose grand people are too high to care for their letters like that, or else how they can bear to have them commented upon, and handed about from one servant to another, and at last served up all stale on a silver waiter, I can't think. I know their ways from a sister of mine who has lived in high families. Why, letters treated like that, ain't no better than my greens when they've been handled all day—they lose all their crispness.

Well, sir, I can't wholly agree with you there: there *was* interest in the city business, and a fearful one sometimes. Not so much of the softer kind; though I *have* seen young chaps fire up red-hot when I handed in a dainty little white note along with the blue ones. But I've seen merchants set their teeth, and draw their breath hard, as they tore open letters that were to carry life or death, as ruin or success followed their ventures. Ah, I've seen many a sad scene in the city; because it's easy to guess what you don't see, from what you do. I remember well a house in one of the

narrow city-lanes, where the office was on the ground-floor, and the rest was a private house—a small one, altogether not more than ten rooms, I should say; but there were only five people, a gentleman and his daughter, and three servants. The clerks—there were four of them—had nothing to do with upstairs. The young lady *was* a lady, and no mistake; rather small, with beautiful fair hair, and dark blue eyes, with such a mouth—ah, she was pretty—and always dressed in such light pretty muslins, that I remember I used to wonder how she kept them so clean in the smoky city. I used to wonder, too, why she lived there, instead of in her proper place out in the country, for they were rich enough then for that; but I heard from an old covey, that she was the last of a large family, and had left a nice place they had in Surrey, to come and live in the city, that she might be more with her father. Of course, I did not like her the less for that. How I got to see her, was in this way. I came at last to go up the first pair of stairs pretty regular every day, with one of those letters I've been talking of, only somehow, I never quite liked the writing: there was a stroke now and then slipped out in the direction, more than in the name, that used to make me think him a *hard* one; and the sweet lady, like many another, soon got a habit of opening the door for me. I went on in this way pretty nigh three months, and had noticed during that time the old gentleman looking paler and more anxious than usual; when one day, I handed him in his letters, and then began my usual tramp up stairs. As I came down again, I happened to look through the glass door, when I saw the poor gentleman had fallen back in his chair, with the blood gushing out of his mouth, and a letter, that had fallen from his hand, lying open on the floor. All the clerks seemed out, for he was alone, so I went in; and before I called any one from up stairs, I took the letter, folded it up, and as his desk was locked, put it in my pocket. It was a bold thing to do, certainly; but the feeling came strong over me that the crash had come, and that it would be better none of the clerks should see that letter. Then I went up stairs, and with a single knock, that sounded queer to me then, told the servant, who, I suppose, told her mistress as well as she could. Of course there was great confusion and sending for doctors, and I could not get a minute to give the letter to the poor young lady; besides, I did not dare stay longer, for I had half my letters to deliver; so away I went with the letter in my pocket, and many a sour look, and word too, I got for being so late that morning.

You may suppose, sir, I felt very uncomfortable till I had done, for I thought if the old gentleman came to his senses, and asked for the letter, and they knew nothing about it, it would spoil all, and make him worse. As soon as I could get done, I went and asked to see the young lady, for I was determined to give it only to her. They seemed to think it strange; but at last she came, looking so grave, but very quiet; and I told her, poor dear, as well as I could, as I gave her the letter, and said where I had found it, that I was afraid the news contained in it had made her father break the blood-vessel, and inquired if he had asked for it. She said no: he was not allowed to speak; but he seemed very anxious about something, and kept entreating her with his eyes. So I told her, if I might make so bold, I thought she had better say to him she had the letter safe, and no one had seen it. She asked, in a sort of maze, what did I think could be in the letter to make him ill, and why had I taken it. Well, I saw she had not a suspicion of what was coming on her, and so I just said that business sometimes went wrong, and perhaps something had happened to trouble the old gentleman; and she seemed so forlorn-like, that I could not help asking her if she hadn't better write and ask some aunt or cousin to come and stay with her. It was a great liberty, and I often wondered how

I could do it; but she seemed to take it quite naturally, and said no; there was no one she could ask, and she could manage very well; she—and she hesitated a little—had a kind friend. Well, sir, the news of the failure did not get abroad for a week, and I think that week of quiet saved the poor gentleman; and for that week I still went regularly up stairs with the letter to comfort the young lady; but the day of the failure I went up as usual, from habit, and not till my hand was at the knocker did I see there was no letter. I snatched my hand away, as if the knocker were fire, and slunk down the stairs as softly as I could, for it came upon me all at once. I knew then, for certain, that he was a hard one, and was so ashamed of him, that I could not bear all that day to think of the young lady. Next morning, though I was almost sure how it would be, I looked quite anxiously for a letter, and, as I expected, there was none. At the end of a week, as I was sorting, I came on a great thick packet in his writing, and then I saw it was indeed all over. They were her letters—pretty loving ones, I am sure—which the scoundrel had sent her back. Well, sir, I was getting old then, as I said before, and I was such a fool, that for the life of me, I could not make up my mind to take them that delivery. However, I found waiting only made bad worse, besides it was against the rules; so the next time I went and gave, I'm afraid, a very poor knock, for I was dreading she might come, as I had heard the old gentleman was better. And there she was when the door opened; and when I tried to hold out the packet as if it were nothing, she—I shall never so long as I live forget her face—took them more steadily than I gave them, and quietly shut the door; but, poor dear, I heard the sob for all that. I never saw her after: they went away out of my beat; and though I have often asked, I never could get news of them.

Yes, sir, it's very true, postmen used to see something of life, but that's all over now. I don't suppose I could do much for you in the greenery line; but if you'd patronise my new-laid eggs, I've got some Cochinchinas that I expect will lay regular all the winter, and I'll be proud to supply you, sir.

PATENT WARFARE.

I find it extremely amusing to follow the monthly revelations of the *Mechanics' Magazine*, touching what is doing in the world of science. It is true I often meet with matters too deep for me, and abstruse calculations which I do not even attempt to follow; but I turn with infinite pleasure to the monthly list of new patents for 'inventions and improvements.' There I dive into the very arcana of progress, and feel great satisfaction in reflecting that no one can keep his secrets from me, even if he chooses to secure to himself, by patent, the pecuniary advantages of them, with which, in fact, I have no desire to interfere.

It was in this way I came, last month, upon something in the way of invention, which so far transcends all my previous ideas of the legitimate functions and usual operations of the Patent Office, that I cannot resist the temptation of setting down a few observations upon it.

The subject to which I allude is neither more nor less than a proposed patent for war; I say, 'for war;' because, if everything goes on, as usual in such cases, according to the 'specification, no other sort of warfare but that carried on under the patent will be available or possible.

I have sometimes thought that the specification, by which each intending patentee is obliged to declare what it is he purposes securing to himself exclusively, ought, if possible, to be kept secret at least for a time. It would have been peculiarly desirable in this case; because the gentleman seeking to secure

the exclusive right to destroy his fellow-creatures by wholesale—to smother whole armies, and to burn whole fleets 'with certainty and dispatch,' cannot, unfortunately, obtain his object without in the very act disclosing to the whole world how this work of extermination is to be accomplished. The application for this patent was actually 'hushed up' during the war, 'lest its publication should prove detrimental to Her Majesty's service;' but it is now brought forward again, and, as I say, the murder is out with a vengeance. No human power can now recall the sound of trumpet which has gone forth, or snatch from the lips of mankind the fruit of this deadly tree of knowledge. It is now patent to all, that with a few barrels, more or less, of naphtha, and a few pills of potassium, fortified places must be abandoned by the bravest and most resolute defenders; fleets, no matter how numerous, powerful, or well-manned, must be speedily enveloped in devouring flames, which all the waters of the sea cannot extinguish; and even armies on dry land can be shewn that there is a fire which their fire surpasses, as much as that of the hero of Blackheath did that of the chemists.

Nothing can be more curious than the dry, scientific mode in which this subject is treated in the paper before us. This quality, it is true, is common to all works and treatises upon military operations. I well remember the peculiar feeling excited in my mind by reading such works; that while my blood was curdling with horror at the anticipated results of certain deadly combinations, the writer coolly dismissed the subject by speaking of the enemy—always in such cases 'represented by unity,' as the sum-books say—in some such way as this: 'He will in this case be either driven back with great loss, or destroyed.' Still, in ordinary cases, the immolation was not entire, the enemy was not absolutely exterminated; and to find now, therefore, the destruction of whole fleets or armies at one swoop reduced to a cool scientific formula, impresses my mind in a proportionate degree. I feel at a loss to believe that I am reading what was written by a man; and I beg it may be understood that if I have treated the subject at all in a spirit of badinage, it is only because I am incredulous as to the efficacy of the means at the disposal of the patentee for effecting wholesale annihilation, and teaching the world at large to do the same.

'In order to carry out this invention,' says the writer in the magazine, 'he takes coal-tar, naphtha, alone or in combination with other materials, and causes the same to be conveyed to a hostile stronghold, naval battery, or fort, by the following means. In attacking the sea-faces of such strongholds or fortifications as Cronstadt, Malta, or Sebastopol, where there is scarcely any tide, but a sufficient depth of water, he freights with the before-mentioned materials submarine steam-vessels, or vessels rendered shot-proof, having iron compartments or tanks specially adapted for containing the same, and despatches them to the enemy's works; in front of which, by means of pumps, hose, and suitable outlets, a sufficient quantity of the composition is discharged upon the surface of the water surrounding or bordering the fort or battery. He then places a ball of potassium in the entrance of the tube or hose, by means of suitable cocks or taps, and renews the pumping, so as to force the ball of potassium through the tube into the water, when, by its great affinity for oxygen, it will immediately take fire on rising to the surface, and inflame the entire quantity of composition previously transmitted. The consequence is the formation of a dense, black, suffocating fog or vapour, which envelops the fort or battery, rushing into the casemates or embrasures, and driving away the gunners and all engaged therein. He keeps up the supply of the composition for a sufficient period, so that the attacking vessels

can approach sufficiently near to destroy the enemy's works, already rendered untenable and incapable of resistance. Fortresses such as the above named are to be rendered harmless by this process, and destroyed without loss of life to the attacking vessels.'

I give the above as a specimen only. The same materials, we are told, may be combined in many ways, and applied to projectiles of various kinds. The principle is the same in all cases. The 'suffocating fog' is to smother all who are not within reach of the actual fire; and submarine boats are to shoot to the surface on which floats a hostile fleet those deadly materials which are to insure its destruction without risk to those below. It is no longer a pity—as it was—that villainous saltpetre should be dugged out of the bowels of the harmless earth, and many a good tall fellow destroyed by its agency: it is villainous potassium, and still more execrable naphtha, which some future popinjay shall denounce as the exterminators of tall and short fellows alike!

So curious do I think the article to which I am now referring, and which is merely an amplification of the specification itself, that I could willingly linger over it until I had exceeded reasonable limits. There is, however, one paragraph which strikes me as indicating a degree of nicety and perfection in the use of the formidable powers now placed at our disposal, which deserves a little further attention.

We are informed that 'where the destruction of an enemy's vessels is not desired, the hostile fleet is permitted to enter a channel, or to take up any position chosen for its attack; the inflammable material is then discharged, and ignited at moderate distances from the various vessels composing the fleet, precautions being taken to regulate the supply in such a way, that, while the flames are not suffered to approach and injure the vessels, the black fog enshrouds the fleet in impenetrable darkness, and destroys their crews simultaneously with the stifling vapour. The operation being completed, the atmosphere is allowed to regain its natural purity, and possession of the fleet may then be obtained.' This precision and accuracy reminds one of what is said of Nasmyth's steam-hammer, which, while it can forge an anchor of many tons' weight, may be used to crack a hazel-nut.

It would further appear that the shot-proof batteries of iron, worked on water by steam, are to be completely powerless in the hands of this patentee. He can, from below, envelop them in noxious gases, which are sure to be drawn down into the engine-room by the draught of the furnace, destroying the engineers, and rendering attempt at escape hopeless.

One more quotation: 'Land-batteries furnished with well-served, long-ranged guns, firing the M'Intosh shells, filled with combustible material, would effectually protect a town or harbour from the attack of an enemy's fleet; or even a few shot-proof vessels having well-served guns, firing such shells, would not only keep a hostile fleet in check, but scatter on the vessels a vast shower of burning material, causing a general conflagration.'

Troops attempting to pass through a defile or mountain-pass have no chance at all. Masses of cotton, or other fibrous material, steeped in naphtha, are to be placed in their way, ignited, and 'the supply kept up by hose from some convenient high place; and so the men must all perish miserably from want of air—'suffocated in absolute darkness!'

Such is the new character which war is destined to assume 'under the patent.' The thing which strikes us most forcibly, is the disadvantage at which we shall compete with other nations. We are required, it would seem, to secure to an individual, by patent, the advantages arising from the use of materials which other nations, now that the thing is made public, can use against us; just as if when gunpowder was first

invented, and its composition made known to all the world, the country of the inventor could turn it against aggressors only by paying a royalty for permission to do so. I cannot but think that, in the event of a war, this would place us in rather an awkward predicament.

This subject is, on the whole, very 'suggestive,' to use a favourite phrase; and no doubt it will be felt so before very long. The brilliant army of 'coachmen and guards' of my boyish days, has so completely gone down before the onslaught of the dusky corps of stokers and pokers, that I feel I ought not to wonder if the cavalry and infantry who still hold their ground on land, and the blue jackets who man our noble ships at sea, were to disappear in a short time, leaving their places to a tarry brigade of submarine boatmen, a dozen regiments of 'wagon-train,' destined for the transport of naphtha, and a corps of engineer chemists, to be employed in the concoction and administration of potassium pills.

I have treated this matter, according to my present view of it, as one which exhibits the lengths to which theory will sometimes carry its votaries, rather than as worthy of serious faith in the professions of the patentee.

If, upon further examination, however, his project can be realised, and patent warfare becomes a great fact in modern history, it may be the means of effecting an indirect good, through the power of insuring the total extinction of all who engage in war on either side. When the ingenuity of man shall have at length devised the means of effecting this, all war must cease as a matter of course; and nations must find some other mode of settling their quarrels and adjusting their differences. Would it not, then, be a good plan, if, by mutual consent, a general patent for peace was to be granted to this ingenious inventor, instead of a patent for war, and that all civilised nations were to bind themselves not to infringe his rights by making use of his discoveries without his consent? Thus he would become a grand arbiter and peace-preserver; and his power of allowing any one of the contracting parties, if aggrieved, to 'pitch' into the wrong-doer with this dangerous compound of bituminous substances, and smoke him in his fortresses like an old fox in his den, would be sure to act as a salutary check upon the rest, and keep them on their good-behaviour. This looks plausible, and may be useful; but the question may be asked: Would it pay?—What would the patentee say to it? It is clear that he proposes advantages, no doubt pecuniary ones, to himself, by the sale of royalties; and we do not yet know the price at which he is willing to allow us to destroy our enemies: as for our enemies, they will destroy us by the use of his invention without asking his permission.

In short, if this invention really answers to the specification, the inventor must have counted largely on the stupidity of the country in asking for a patent, and the country must have acknowledged his judgment to be quite correct by granting it.

LOUIS XVI. ON THE SCAFFOLD.

HISTORIANS of all political shades have till recently told us that Louis XVI. submitted himself with pious resignation to the fate which awaited him; and that, attended to the scaffold by the courageous Abbé Edgeworth de Firmont,* a relative of the late Maria Edgeworth, he tranquilly surrendered his soul into the hands of its Maker, which, as it winged its flight on high, was accompanied by these famous words of the

* Firmont is the name of a small estate in the county of Longford, about five miles distant from the seat of the Edgeworth family at Edgeworthstown, celebrated some thirty years ago for a philanthropic college, founded there in 1818 by the late Mr Lovell Edgeworth, and which was much admired and praised by Sir Walter Scott, while on a visit to Miss Edgeworth during the summer of 1835.

confessor: '*Montez au ciel, fils de Saint Louis!*'—(Son of Saint Louis, ascend to heaven!) But Louis Blanc's *History of the Revolution* gives a version as new and as startling as it is opposite and extraordinary.

'At ten minutes past ten,' he says, 'the procession reached the foot of the scaffold. It had been erected in front of the palace of the Tuileries, in the square called after Louis XV., and near the spot where stood the statue of the most corrupt of kings—a king who died tranquilly in his bed. The condemned was three minutes descending from the carriage. Upon quitting the Temple, he had refused the over-coat which Clery, his valet-de-chambre, had offered him, and now appeared in a brown coat, white waistcoat, gray breeches, and white stockings. His hair was not disordered, nor was any change perceptible in his countenance. The Abbé de Firmont was dressed in black. A large open space had been kept round the scaffold, with cannon on every side; while beyond, as far as the eye could reach, stood an unarmed multitude. When the executioner came to open the door of the carriage, Louis, in a tone of authority, ordered him to take care of his confessor. Having alighted, Louis fixed his eyes upon the soldiers who surrounded him, and, with a menacing voice, cried: "Silence!" The drums ceased to beat, but, at a signal from their officer, the drummers went on again. "What treason is this?" he shouted. "I am lost! I am lost!" For it is evident that up to this moment he had been clinging to hope. The executioners now approaching him to arrange his dress, he repulsed them haughtily, and himself removed the collar from his neck. But all the blood in his frame turned into fire when they sought to tie his hands. "Tie my hands!" he shrieked. A struggle was inevitable; it came. "It is indisputable," says Mercier, "that Louis fought with his executioners." The Abbé Edgeworth stood by, perplexed, horrified, speechless. At last, as his master seemed to look inquiringly at him, he said: "Sire, in this additional outrage, I see only a last trait of the resemblance between your majesty and the God who will give you your reward." At these words, the indignation of the man gave way to the humility of the Christian, and Louis said to the executioners: "I will drain the cup to the dregs." They tied his hands, they cut off his hair, and thus leaning on the arm of his confessor, he began, with a slow tread and sunken demeanour, to mount the steps of the guillotine. Upon the last step, however, he suddenly roused himself, and walked rapidly across to the other side of the scaffold, when, by a sign commanding silence to the drummers, he exclaimed: "I die innocent of the crimes imputed to me." His face was very red, and, according to the narrative of his confessor, "his voice was so loud that it could be heard as far as the Pont Tournant." Some other expressions were distinctly heard: "I pardon the authors of my death; and I pray God that the blood you are about to shed may never be visited upon France!" He was about to continue, when his voice was drowned by the renewed rolling of the drums, at a signal which, it is affirmed, was given by the comedian Dugazon, in anticipation of the orders of Santerre. "Silence! Be silent!" cried Louis XVI., losing all self-control, and stamping violently with his foot. Richard, one of the executioners, seized a pistol, and took aim at the king. It was necessary to drag him along by force. With difficulty fastened to the fatal plank, he continued to utter terrible cries, only interrupted by the fall of the knife, which struck off his head. This was immediately shewn by the executioners to the people, who shouted in reply: "Long live the Republic!"

Such is the version of M. Louis Blanc, a French political refugee at present in this country, and we confess we have never before found anything of the kind in the various accounts we have perused of that great political tragedy of the first French

Revolution. As a contrast to this statement, we shall here produce the narrative we have found in a work published in Paris about two years ago, entitled *Anecdotes of the Reign of Louis XVI.**

'*The Execution.*—People have been accustomed to read the account given of Louis XVI.'s death by royalist historians; we prefer publishing the article of a republican journal of the time. As the editor of that journal had voted for the death of the king, he felt no sympathy for the victim; and should we possess no other version than the one we quote, the king's last dying moments cannot appear otherwise than truly Christian-like, truly admirable.'

The article commences with an account of the prison-hours of Capet, as the republicans called the king, on the day when his sentence of death was notified to him; but as this does not differ materially from that of the common authorities, we pass on to the nearer preparations for the dreadful morrow.

'The minister of justice had brought the confessor with him in his carriage, and when the former withdrew, the king asked for his own family. Thereon a municipal officer repaired to the females' department, and said to Antoinette: "Madame, a decree authorises you to come and see your husband, who is desirous to see you and your children!" At nine that evening the whole family visited him, when there were screams, and tears, and sobs for some time. After that, they were all a little calmer, and separated at half-past ten; but as they were leaving him, the king asked of his guards if he might see his family once more on the morrow-morning, to which he was answered affirmatively, and then he supped by himself. During the family interview, the confessor had been concealed in one of the towers of the Temple prison, but when the family left, he joined Louis Capet. Some time after, this confessor presented himself before the sitting council, and informed them, that as Louis wished mass to be said, it would be expedient to have the necessary things got ready; whereupon the council gave their orders, and the vicar of Saint-François d'Assise supplied all the requisites. Louis supped as usual, spent a part of the night with his confessor, and both retired to rest, in different chambers, at two o'clock, Clery receiving Louis's orders to be with him by five. He slept well; and Clery entered his room at the hour appointed, dressed him, and arranged his hair, which, while being done, Louis took from off his watch-chain a wedding-ring, upon which his own and his wife's initials, as well as the date of their marriage, were engraven. At half-past six he heard mass, partook of the sacrament, and spent the rest of the time, up till eight o'clock, with his confessor. He then asked for a pair of scissors, which the council, after deliberation, refused him. When the moment of departing for the place of execution arrived, he asked to be left alone for a few minutes. He then handed the small ring mentioned to Clery, saying to him: "Give this to my wife, and tell her that I separate from her with sorrow and anguish." He also gave him for his son a silver watch-seal, upon which the crown of France was engraved, and a small packet of the hair of all his family for the queen, adding: "Say to her that I ask pardon for not having sent for her as I promised; but it was only to spare her the pangs of a cruel separation." He also wished to hand a paper to one of the municipal guards, who refused taking charge of it; but another of them took it. It was his will and testament. He requested that Clery should be allowed to remain with his family; and then he took his departure with calmness, without being bound, and accompanied by the citizen-lieutenant Labrasse, a sergeant-major of gendarmerie, and his confessor. He was observed asking several times for his hat, which was given him.

* Librairie de L. Hachette et Cie., Rue Pierre-Sarrasin, Paris.

When near the staircase, he wanted to speak privately to a person present, but was prevented from so doing by the lieutenant. "Oh, fear nothing," said he. He then descended the flight of steps, and crossed the court-yard on foot, through a double row of gendarmes. When he reached the carriage, which was the mayor's own private one, he went in first, followed by his confessor, and the lieutenant and sergeant-major; the former next to him, and the two latter placing themselves opposite to him. While on the way, he read the prayers for the dying and the Psalms of David. The greatest silence reigned around. On arriving at the Place de la Révolution (the square since called after Louis XV.), he several times recommended his confessor to the special care of the lieutenant, and then alighted. He was instantly given up to the executioner. He took off his coat and cravat with his own hands, and only kept on his plain swanskin vest. At first he would not allow his hair to be cut off or his hands to be tied; but after a few words from his confessor he submitted. He then mounted the scaffold, advanced towards the left side, his face being very red, and looking for some minutes on the objects around, inquired if the drums would not cease beating. He wished to go forward to speak to the vast concourse collected, but several voices cried out to the executioners, who were four in number, to do their duty. Nevertheless, while being strapped to the fatal plank, he distinctly pronounced these words: "I die innocent; and it is my wish that my blood may be of use to the French people, and that it may appease the wrath of Almighty God." At ten minutes past ten o'clock, his head was severed from his body, and then held up to the people, when from all sides the cry of "Long live the Republic!" was instantly heard. Louis's remains were placed in an osier pannier, taken off in a cart to the churchyard of the Madeleine, and interred in a grave between two layers of quicklime. A guard was placed over it for a couple of days.—*Les Révolutions de Paris.*

Let the reader 'look on this picture and on that,' and determine which of the two is the more consistent with the general character and bearing of Louis.

Perhaps we may close this brief notice by following the melancholy contents of that osier pannier to its grave of quicklime, and shewing the anxiety felt even by the regicides to treat the remains of the king with decency and decorum.

'On the 20th of January 1793,' says Renardon, 'the executive power communicated to M. Picavez, the vicar of the parish of La Madeleine, their instructions relative to the obsequies of his majesty Louis XVI.; but the worthy vicar, not feeling himself equal to the fulfilling of a task so onerous and so painful, feigned illness, and advised me, as his principal curate, to fill his place, and to take upon myself the responsibility of carrying out the orders of the executive power. My first answer was a positive refusal, because none perhaps ever loved the king more than myself; but I at last consented, as M. Picavez made me comprehend the disagreeable consequences which might accrue to us both, if I persisted in my refusal. On the morning of the following day, therefore, the 21st of January, after having made sure that everything ordered by the executive power—such as the quantity of quicklime, and the depth of the grave, which, as well as I can remember, was to be either ten or twelve feet—had been punctually attended to, I went, accompanied by the late Abbé Damoreau, and took up my position at the gate of the church, and there awaited, in solemn silence, the arrival of the royal corpse. When I claimed the body of his majesty, the members of the department and of the commune replied to me that they had received orders not to lose sight of it for a moment; so we were obliged to accompany them to the cemetery situated

in the Rue d'Anjou St Honoré. When we reached and entered it, I obtained profound silence, and then the royal corpse was delivered up to us. It was clad in a white vest (*piqué blanc*), gray silk breeches, and stockings of the same. We chanted the vesper-service, and recited all the prayers in use for the service of the dead; and truth commands me to say that the vast populace around, whose cries and vociferations but so lately rent the air and chilled the heart, listened in the most religious silence to the prayers and orisons offered up for the repose of his majesty's soul. We then withdrew in silence, after so painful a ceremony, and a *procès verbal* (authenticated report) was drawn up on the spot by the *juge de paix*. On my return to the church, I drew up myself, and inscribed a funeral act, in due form, in a plain register-book, which was seized and carried off by the revolutionary committee, on the compulsory closing of that church.'

In the midst of a nicely laid out garden, formerly the cemetery of La Madeleine, at the extreme end of the Rue d'Anjou, and open to the public, stands the Chapelle Expiatoire, erected after the Restoration in memory of Louis XVI.; and even to this day, after the turmoils of revolution and subversion, that expiatory edifice is always crowded on every 21st of January.

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LII.—THE ROUTE.

It was a struggle between Aurora and the moon which of them should rule the sky, when our bugle rang its clear *réveille*, rousing the rangers from their slumber, and startling their steeds at the stall. The goddess of morning soon triumphed, and under her soft blue light, men and horses could be seen moving about, until the bugle again sounded; this time to 'boot and saddle;' and the rangers began to form in the plaza, and prepare for the route.

A single wagon with its white tilt and long team of mules, already 'hitched up,' stood near the centre of the square. It constituted the whole baggage-train of the corps, and served as an ambulance for our invalids. Both baggage and sick had been safely stowed, and the vehicle was ready for the road. The bugler, already in his saddle, awaited my orders to sound the 'forward.'

I had climbed to my favourite 'smoking-room,' the azotea. Perhaps it was the last time I should ever set foot on those painted tiles. My eyes wandered over the plaza, though I little heeded what was passing there. Only the salient points of the picture were noted by me—steeds under saddle and bridle; men buckling on folded blankets, holsters, and valises; a few already in the saddle; a few more standing by the heads of their horses; and still another few grouped around the door of the *pabperia*, having a last drink of *mezcal* or *catalan* with their swarthy Mexican acquaintances. Here and there, in front of some adobe hut, might be observed a more tender leave-taking. The ranger fully equipped—with arms, haversack, and canteen—leaning against the heavy bars of a window, with face turned inward, as though he was talking to some prisoner through the grating of a jail. But he is himself the real captive, ensnared during his short sojourn, and still held in chains by the olive-skinned *poblano*, whose dark liquid eyes may be seen on the other side of the *reja*, flashing with love, or melting with sad tenderness at the prospect of parting.

Others, again, are bidding their *adieu* in retired corners, under the shadow of the church walls, or in groups of four or five more openly in the plaza itself. Early as is the hour, the people have all arisen; and

not a few of the brown, rebosa-clad, short-skirted wenchers are already on their way, *jorro* on head, to the fountain. There the pitchers are filled, and lifted on their heads—perhaps for the last time—by the rangers, who perform the office with all the rude grace in their power. Then follows a profusion of smiles and bows, and a dialogue, on the ranger's part extending to the whole of his Spanish, which consists of the phrase:

'Mucho bueno, muchacha!'

The usual reply, accompanied with a display of pretty white teeth, is:

'Mucho bueno, caballero! mucho bueno Tejano!' given in like ungrammatical phrase, in order that it may be intelligible to the person to whom it is addressed.

I have often been surprised at the success of my great uncouth followers with these *petite* dark-eyed damsels of Anahuac; but, indeed, many of the rangers are not bad-looking men. On the contrary, there are handsome fellows among them, if they were only put into clean shirts, and a little more closely shaven. But woman's eye is keen-sighted in such matters: she easily penetrates through the disguise of dust, the bronze of sun-tan, and the shaggy mask of an ill-kept beard; and no eye is quicker in this respect than that of the fair Mexicana. In the big, apparently rude, individual, called a 'ranger,' she beholds a type of strength and courage, a heart that can cherish, and an arm that can protect her. These are qualities that, from all time, have won the love of woman.

It is evident they are not all friends whom we are leaving behind us. Hostile faces may be observed, many of them, peering from open doors or windows. Here and there a sulky lepero swings about in his blanket, or cowers by the corner of the street, scowling savagely from under his broad-brimmed hat. Most of this class are absent—as long since ascertained—with the guerrillas; but a few still remain to give shadow to the picture. They regard the approaches towards the women with ill-concealed anger; and would resent this soliteness if they dared. They confine the exhibition of their spite to the dastardly meanness of ill-treating the women themselves, whenever they have an opportunity. No later than the night before, one of them was detected in beating his sweetheart or mistress or the crime, as was alleged, of dallying too long in the company of a Tejano. The Tejano, in this case, took the law into his own hands, and severely chastised the jealous *pelado*.

Even in the hurried glance which I gave to these scenes of leave-taking, I could not help noticing an expression on the faces of some of the young girls that had in it a strange significance. It was something more than sadness: it was more like the uneasy look that betokens apprehension.

Perhaps the state of mind I was in magnified my perceptions. At that moment, a struggle was passing in my own breast, and a feeling of irresolution lay heavy upon me. All night long had my mind dwelt upon the same thought—the danger that menaced my betrothed—all night long I had been occupied with plans to avert it, but no reasonable scheme had I succeeded in devising.

It is true the danger was only hypothetical and undefined, but it was just this supposititious indefiniteness that caused the difficulty in providing against it. Had it assumed a tangible shape, I might more easily have adopted some means of avoiding it: but no—it remained a shadow, and against a shadow I knew not what precautions to take. When morning broke, I was still struggling under the same nervous indecision.

Problematical as was the peril my fancy had formed, there were moments when it appalled me—moments when my mind laboured under a painful presentiment, and I could not cast the load by any act of volition. With all my philosophy, I could not fortify myself

against the belief that 'coming events cast their shadows before;' and, spite of myself, I kept repeating in thought the weird prophetic words. Upon my soul, certainly, there were shadows, and dark ones; if the events should have any correspondence with them, then there was misery before me.

I have termed the danger in which Isolina was placed indefinite: it was not so indefinite, after a slight analysis; it was directly traceable to the presence of Rafael Ijurra. True, there were other sources of apprehension; other perils surrounded her, arising from the disturbed state of the country—but these did not point at her in particular. That frontier province had been for years in a distracted condition—by revolution or Indian invasion—and war was no new thing to its people. In the midst of strife had the fair flower grown to perfect blooming, without having been either crushed or trodden upon. Isolina de Vargas was a woman of sufficient spirit to resist insult and cast off intrusion. I had just had proof of this. Under ordinary circumstances, I had no fear that she would be unequal to the emergency; but the circumstances in which she now stood were not of that character; they were extraordinary and to an extreme degree. In addition to the light thrown upon Ijurra's designs by his own menacing confession, I knew other particulars of him. Holingsworth had helped me to a knowledge of this bad man, and that knowledge it was that rendered me apprehensive. From a nature so base and brutal, it was natural I should dread the worst.

But what could I do? I might have thrown up my commission, and remained upon the spot, but that would have been worse than idle. I could not have protected myself, much less another. The rangers once gone from the place, my life would not have been safe there for a single hour.

Only one plan suggested itself that had the semblance of feasibility—to seek another interview with Isolina—her father as well—and adjure them to remove at once from the scene of danger. They might go to San Antonio de Bexar, where, far removed from hostile ground, they could live in safety till the war should be ended.

It was only at the last moment that this happy idea came into my head, and I reviled myself that I had not conceived it sooner. The chief difficulty would lie in the opposition of Don Ramon. I knew that he was aware of the *friendship* that existed between his daughter and myself, and furthermore, that he had opposed no obstacle to it; but how could I convince him of the necessity for so sudden an expatriation as the one I was about to propose? how should I persuade him of the peril I myself dreaded? and from such a source!

Another difficulty I might encounter—in the proud spirit of Isolina herself. Much did I fear she would never consent to be thus driven from her home, and by such a poltroon as she knew her cousin to be. She had cowed and conquered him but the day before; she feared him not; she would not be likely to partake of my painful apprehensions. My counsel might be disregarded, my motives misconstrued.

The time, too, was unfavourable. We must be on the march by sunrise—so ran our orders—and already the day was breaking. I cared not much for this: I could easily have overtaken my troop; but it was a delicate matter—that could only be excused by a certain knowledge of danger—to awake a gentleman's family at such an hour, even for the purpose of warning them. Moreover, should my advice prove fruitless, I reflected that my visit—which could not be made in secret—might aid in bringing about the very danger I apprehended. A circumstance so extraordinary could not fail to be noticed by all.

It was thus that I was held in irresolution, while my troop was forming for the march.

At the last moment, thanks to the thoughtful Holingsworth, a compromise offered. He suggested that I should send my advice in writing. In that I could be as explicit as I pleased, and bring before my protégés all the arguments I might be able to adduce—perhaps more successfully than if urged by a personal appeal.

My comrade's suggestion was adopted; and in haste, but with a fervour resulting from my fears, I penned the admonitory epistle. A trusty messenger was found in one of the *Ayankieados*, who promised, as soon as the family should be stirring, to carry the letter to its destination.

With my heart somewhat relieved of its load, though still far from light, I gave the order to march. The bugle rang clear and loud, and its cheerful notes, as I sprang into the saddle, combined with the inspiration borrowed from my buoyant steed, produced a soothing effect upon my spirit.

CHAPTER LIII.

CAMP GOSSIP.

It was but a short-lived light—a passing gleam—and soon again fell the shadow, dark as ever. Strive as I might, I could not cast the load that weighed upon my bosom; reason as I would, I could not account for its heaviness.

It was natural that a parting like ours should produce pain, and misgivings as to the future. My life was to be staked in the lottery of war; I might fall on the field of fight; I might perish by camp-pestilence—a foe that in the campaign kills more soldiers than sword or shot—the many perils of flood and field were before me, and it was natural I should regard the future with a degree of doubtfulness. But it was not the contemplation of all these dangers that filled me with such a terrible foreboding. Strange to say, I had a forecast that I should survive them. It was almost a conviction, yet it failed to comfort me. It comprehended not the safety of Isolina. No—but the contrary. Along with it came the presentiment, that we should never meet again.

Once or twice, as this dread feeling became most acute, I reined up my horse, half resolved to gallop back; but again the wild idea passed from me, and I continued irresolutely on.

Something of prudence, too, now restrained me from returning: it would no longer have been safe to go back to the rancharia. As we issued from the piazza, we could hear distant jeering, and cries of '*Mueran los Tejanos!*' It was with difficulty I could restrain the rangers from turning to take vengeance. One, the worse for mezcal, had loitered behind, under the influence of the drink, fancying himself secure. Him the *pelados* had 'bonnetted,' and otherwise maltreated. They would have murdered him outright, but that some of them, more prudent than their fellows, had counselled the mob to let him go—alleging that the Tejanos were yet 'too near, and might come back.'

Again I had strife with my men: they would have returned and fired the place, had I permitted them. Fortunately, he who had been ill treated was a good-for-nothing fellow—scarcely worth the sympathy of his comrades—and I was well satisfied at his having received a lesson. It might be useful, and was much needed, for 'straggling' was one of the ranger-crimes most difficult to cure.

Along the road, we saw signs of a guerrilla. Shots were fired at us from a hill; but a party sent to the place encountered no one. Horse-tracks were observed, and once a brace of mounted men were seen galloping away over a distant slope. It might be the band of Ijurra, and doubtless it was so; but we fancied at the time that Canales himself was near; and as an encounter with his large and well-organised force would

be a very different affair from a skirmish with the other, we felt the necessity of advancing with caution.

The prospect of a 'fight' with that noted partisan created quite an excitement in the ranks. To have captured Canales—the 'Chapparal Fox,' as the Texans termed him—or to have made conquest of his band, would have been esteemed a feat of grand consequence—only inferior in importance to a pitched battle, or the taking of 'Game-leg' (Santa Anna) himself.

I confess that to me the idea of measuring strength with the famed guerrillero was at that moment rife with charms; and the excitement derived from the hope of meeting him, for a while abstracted my mind from its painful bodings.

But we reached the town without seeing aught of the Chapparal Fox. It was not likely that he was on that road; or if so, he took care not to shew himself. Canales fought not for glory alone, and the rangers were not the foes he cared to encounter. Rich baggage-trains were the game he was used to hunt, and our solitary 'company-wagon,' filled with frying-pans, camp-kettles, sick soldiers, and tattered blankets—half alive with those charming little insects of the genera *pulex* and *pediculus*—had no attractions for the gallant guerrillero.

On reaching the town, we were surprised to find that the division had not yet moved. It was to have marched on that morning, but a countermand had arrived from head-quarters, delaying the movement for some days—perhaps a week.

This was rare news to me; and as soon as I heard it, my mind became occupied with projects and anticipations of a pleasant nature. I had hoped that we would be sent back to the rancharia, but alas! no—our orders were to remain with the division.

As every available building was occupied by troops the rangers, as usual, were treated as 'outsiders,' and compelled to take to the grass. Half a mile from the town, a spot was shewn us for our camp. It was on the banks of a pretty rivulet; and there, having picketed our steeds, stretched our canvas to the sun, and washed the dust from our faces, we made ourselves at home.

I did not remain long by the camp. As soon as our tents were fairly pitched, I left them, and walked back into the town—partly to get more definite information as to the future movements of the army, and partly with the design of indulging a little in the social feeling. I had some old comrades among the different regiments of the division; and after such a long spell of rustication, I was not indisposed to refresh my spirit by the renewal of former fellowships.

At head-quarters, I learned definitely that we should not march for a week at the least. So far good; and after hearing this, I proceeded to the *fonda*, the rendezvous of all the jovial spirits of the army. Here I encountered the friends of whom I was in search; and for a short while I found respite from the thoughts that had been harrowing me.

I soon gathered the current 'camp gossip,' and learned who were the 'newspaper heroes' of the hour, over many of whose names my friends and I could not restrain either our satire or laughter. It appeared that the men of deeds were scarcely known beyond the limits of the army itself, while others, who in the field of battle had actually played the poltroon, had at home become household words in the mouths of the people. One general, whom I myself saw hiding in a ditch during the rage of battle, was the theme of speech, sentiment, and song. The newspapers were filled with praises, and the windows with pictures of 'gallant dragoon officer,' who had somehow obtained the credit of capturing a battery. My rangers cried 'Bah!' when I told them this. They themselves were the men who had first galloped over those Mexican guns!

'Keeping an editor in pay' was a standing sarcasm applicable to more than one of our generals; and the 'army correspondent' taking advantage of this pruriency for fame, lived well, and swaggered in proportional importance.

Ah, glory! what sacrifices men make for thee upon the shrine of conscience! For my part, I do not think I could feel happy under the credit of a feat I had not performed. Surely the consciousness of having done a deed is of itself a sufficient reward? He is but an unhappy hero who is not a hero to himself!

Pleasanter gossip I heard about the relations existing between our troops and the people of the town. Many of the inhabitants had grown quite *Ayankieado*, in consequence of our excellent behaviour towards them. Our conduct was compared with that which they had lately experienced at the hands of their own army. The latter is in the habit of seizing property at pleasure, on pretence of using it for the defence of the state. We, on the contrary, pay for everything—round prices too—in bright American dollars. The ricos and merchants prefer this system, and would have no objections to making it permanent. Outrages are few on the part of our soldiery, and severely punished by the general. Our enemies contrast the modest bearing of the American soldier with the conceited strut and insolent swagger of their own gold-bedizened *militarios*, who are wont on all occasions to 'take the wall' of them. It is only outside the lines, between stragglers and leperos, that the retaliation system is carried on so fiercely. Within the walls, everything is order, with a mildness too rare under martial law. Private property is strictly regarded, and private dwellings are not occupied by our troops. Even the officers are not billeted in private houses; and many of them have to make shift in rather uncomfortable quarters, while most of the soldiers live under canvas. This state of things is scarcely satisfactory to the troops; and some grumbling is heard. There is no complaint, however, from the Mexicans, who seem rather astonished at so much forbearance on the part of their conquerors.

I doubt whether, in the whole history of war, can be found a conquest characterised by equal mildness and humanity, as is the 'Second Conquest of Mexico.'

It is principally for this reason the people have grown so well affected towards us. But there is another, perhaps, not less potent. From the extensive operations we are now about to undertake, they see that we mean war in earnest; and the belief has become general, that a large 'annexation' will follow; that perhaps the whole valley of the Rio Grande will become American territory. It is but human nature in them to do homage to the rising sun.

The ricos are better disposed towards us than the common people; but this enigma is easily explained. The latter are more *patriotic*—that is, more ready to fight for native tyranny, than accept freedom from a foreign hand. 'Tis so in all lands. In the event of a war with England, the black slave of Carolina would range himself by the side of his master, and prove the bitterest foe to the enemies, not of his freedom, but of his country.

The *familias principales* of Mexico have good reasons for being friendly to us. They have a stake to lose, which, under their own government, has been ill guarded for them. No wonder they should desire to come under the broad protecting wings of the northern eagle.

I found that another species of 'annexation' had been going on during my absence. One of our officers had become annexed to a wealthy *señorita* of the place, and the marriage-ceremony had been performed with great pomp and splendour. Another was talked of as being *fiancé*; and it was expected that the example would find numerous imitators.

I need not say that I was much interested by these *novedades*, and I returned with lighter heart to the camp.

CHAPTER LIV.

THE RUINED RANCHO.

The pleasant excitement caused by my visit to my old comrades was soon over; and having nothing to do but lounge about my tent, I became again the victim of the same painful bodings. I could not shake them off.

Subtle and mysterious is the spirit-world within us; certainly does it seem to have prescience of the future. Is it an electric chain connecting what is, with what is to be? Or is it the second-sight of instinct? Certainly there are times when something within whispers a warning, as, in the physical world, God's wild creatures are warned from without of the earthquake and the storm. How often do we experience the realisation of portentous dreams? Why should not the waking soul have also its moments of clairvoyance?

As I lay stretched upon my leathern *cátré*, I gave way to such reflections. I soon succeeded in reasoning myself into a full belief in foreknowledge; and my apprehensions were proportionately strengthened. But I had conceived a design, and the prospect of putting it in execution somewhat relieved me from the heaviness I had hitherto felt.

My new project was to take a score of my best men, to ride back the road we had come, place the party in ambush near the hacienda, while I alone should enter the house, and further urge the counsels I had committed to writing. If I should find that these had been already followed, so much the better—I should be assured, and return content; but I felt almost certain that Don Ramon had rejected them. At all events, I was determined to know the truth—determined, moreover, to gratify my longing for one more interview with my beloved.

I had warned the men and fixed the hour—as soon as it was dark enough to conceal our departure from the camp.

I had two reasons for not starting earlier—first, because I did not wish this *private scouting* to be known at head-quarters. It is true that in such matters we rangers had the advantage of regular troops. Though belonging to the division, our duty was usually detached from it, and we were rarely 'missed' when absent. There was thus a sort of pleasant independence in my command, which I for one fully appreciated. For all that, I did not desire the whole world to know of an expedition like the one projected.

My second motive for going in the night was simple prudence. I dared not take the whole of my command along with me without permission from above. The absence of the corps without leave would certainly be noticed, even were it but for a few hours; and with the smaller party I intended to take, caution would be requisite. Should we move along the road before it was deserted, some swift messenger might carry the tidings *en avant*, and get us into trouble.

I designed to start at the earliest hour of darkness, so that I might not alarm the hacienda by a midnight visit. An hour and a half of constant riding would bring me to its gate. * * *

At the last moment of twilight we were in our saddles; and rode silently into the chapparal that skirted our camp. After fling for some distance through a narrow path, we debouched upon the up-river road—the same that conducted to the rancheria.

The trappers, Rube and Garey, acting as scouts, went forward in the advance. They were on foot—their horses remaining behind with the party.

It was a mode of march I had adopted after some experience in bush-fighting. The scouts of a marching

force should always go on foot, whether the main body be dragoons or infantry. In this manner they can take advantage of the ground; and by keeping under cover of the timber, are enabled to reconnoitre the angles of the road in a much safer way than when on horseback. The great danger to a scout—and consequently to the party for which he is acting—lies in his being *first* seen, and the risk is greater when he is mounted. The horse cannot be drawn under cover without an effort; and the sound of the hoof may be heard; whereas in nine cases out of ten, a man on foot—that is such a man as either Rube Rawlings or Bill Garey—will discover the enemy before he is himself seen, or any ambushade can be attempted. Of course the scout should never advance beyond the possibility of retreating upon the party he is guiding.

With full confidence in the men who had been sent forward, we rode on, timing our pace, so as not to overtake them. Now and then we caught a glimpse of them, at the further end of a long stretch, skirting the bushes, or stooping behind the cover, to reconnoitre the road in advance. To our chagrin, it was clear moonlight, and we could distinguish their forms at a great distance. We should much have preferred a darker night.

The road we were travelling upon was entirely without habitations; most of it ran through light chapparral forest, with neither clearing nor homestead. One solitary *ranchito* stood at about equal distances between the town and the *rancheria*; and was known among the rangers by the familiar sobriquet of the 'half-way house.' It was a poor hovel of yucca, with a small patch around that had once grown yams, chilipepper, and a stock of maize for whoever had inhabited it; but its occupants had long since disappeared—the prowling soldier-robber from the camp had paid it many a visit, and its household gods lay broken upon the hearth. The *tortilla* stone and *comal*, red earthen ollas, calabash cups, bedsteads and benches of the *caña vaquera*, a whirling spindle, an old stringless *jarana* or bandolon, with other like effects, lay in fragments upon the floor. Mingling with these were cheap coloured wood-prints, of saints and Saviour, that had been dragged from the walls, and with the torn leaves of an old Spanish *misa*, trampled in dust and dishonour.

I paint this tableau of ruin, not that it was in any way connected with the events of our narrative, but that it had strangely affected me. On the day before, as we rode past, I had halted a moment by the little *ranchito*, and contemplated the scene with a feeling of melancholy that amounted almost to sadness. Little thought I that a still sadder spectacle awaited me in that same spot.

We had approached within less than half a mile of the *ranchito*, when a strange medley of sounds reached our ears. Human voices they were, and borne upon the light breeze we could distinguish them to be the voices of women. Occasionally harsher tones were heard mingling in the murmur, but most of them had the soft rich intonation that distinguishes the female voice.

We all drew bridle, and listened. The sounds continued in the same confused chorus, but there was neither song nor joy in the accents. On the contrary, the night-wind carried upon its wings the voices of 'lamentation and wailing.'

'There are women in trouble,' remarked one of my followers in a loud suggestive tone.

The remark caused all of us simultaneously to ply the spur, and ride forward.

Before we had galloped a dozen lengths, a man appeared coming from the opposite direction, and advancing rapidly up the middle of the road. We saw it was the scout Garey; and, once more reining up, we awaited his approach.

I was at the head of the little troop, and as the

trapper drew near, I could see his face full under the light of the moon. Its expression was ominous of evil tidings.

He spoke not until he had laid his hand upon the pommel of my saddle, and then only in a subdued and saddened tone. His words were:

'Thar's ugly news, capt'n.'

O that terrible foreboding!

'News?—ill news?' I stammered out; 'what, for Heaven's sake?—speak, Garey!'

'They've been playin' the devil at the *rancheria*. Them ruffins hez behaved wuss than Injuns would a done. But come foward, capt'n, an see for yurself. The weemen are clost by hyar at the shanty. Rube's a tryin' to pacify them, poor critters.'

O that terrible foreboding!

I made no response to Garey's last speech, but rode forward as fast as my horse could carry me.

A brace of minutes brought me up to the *ranchito*, and there I beheld a spectacle that caused the blood to curdle in my veins.

CHAPTER LV.

A CRUEL PROSCRIPTION.

The open space in front of the hovel was occupied by a group of women—most of them young girls. There were six or seven; I did not count them. There were two or three men, Mexicans, mixed up in the group. Rube was in their midst, endeavouring in his broken Spanish to give them consolation and assurance of safety. Poor victims! they needed both.

The women were half-naked—some of them simply *en chemise*. Their long black hair fell loosely over their shoulders, looking tossed, wet, and draggily. There was blood upon it; there was blood upon their cheeks in seams half dried, but still dropping. The same horrid red mottled their necks and bosoms, and there was blood upon the hands that had wiped them. A red-brown blotch appeared upon the foreheads of all. In the moonlight, it looked as if the skin had been burnt. I rode closer to one, and examined it: it was a brand—the fire-stamp of red-hot iron. The skin around was scarlet, but in the midst of this halo of inflammation I could distinguish, from their darker hue, the outlines of the two letters I wore upon my button—the well-known 'U. S.'

She who was nearest me raised her hands, and tossing back from her cheeks the thick clustered hair, cried out:

'*Miralo, señor!*'

O Heaven! my flesh crept as I looked upon that source of that crimson hemorrhage. Her ears had been clipped off—they were wanting!

I needed no farther uplifting of their hair to satisfy me that the others had been served in like manner; the red stream still trickling adown their necks was evidence enough.

The men, too, had been similarly abused. Two of them had suffered still farther mutilation. They held up their right arms before my face—not their hands. *There were no hands.* I saw the hanging sleeve, and the blood-steeped bandage on the stump. Their hands had been chopped off at the wrists. Horrid sight!

Both men and women gathered around me, clasping my knees, and uttering prayers and entreaties. No doubt, most of them were known to me by sight; but their features were now unrecognisable. They had been the friends and sweethearts of the corps, and my followers were already addressing them by name. The lovers of one or two were present, and embraced them.

One appeared more richly costumed than the rest, and upon her my eyes had fallen, as I first rode up. I almost dreaded to approach her, as she stood

a little apart; but no—it could not be—she was not tall enough; besides, the ruffians would not dare'—
'Your name, señorita?'

'Conchita, señor—la hija del alcalde.'

The tears burst from her eyes, mingling with blood as they ran down her cheeks. Oh, that I too could have wept! Poor Wheatley! he was not with us. He had yet to receive the blow: it would soon fall.

My heart was on fire; so were those of my followers. They swore and foamed at the mouth. Some drew pistols and knives, calling out to me to lead them on. Never saw I men in such a frenzy of rage: the most cold-blooded among them seemed to have suddenly gone mad.

I could scarcely restrain them, till we should hear the tale. We guessed it already; but we needed some details to assist us in executing vengeance. It was told by many mouths, interrupting or confirming one another. One of the men was more coherent—Pedro, who used to sell mezcal to the troop. To him we listened. The substance of his story was as follows:

Shortly after we had left the rancharia, it was entered by the guerrilleros with cries of '*Viva Santa Anna! Viva Mexico!*' and '*Death to the Yankees!*' They commenced by breaking open several *tiendas*, and drinking mezcal and whatever they could find. They were joined by the mob of the place—by *leperos* and others. Pedro noticed the *herredero* (blacksmith) and the *matador* (cattle-killer) taking a conspicuous part. There were many women in the mob—the mistresses of the guerrilleros, and others of the town.

After drinking a while, they grew more excited. Then was heard the cry: '*Mueran los Ayankieados!*' and the crowd scattering in different directions, entered the houses, shouting, '*Saqueños afuera! matenlos!*' (Drag them out! kill them!) The poor girls and all who had been friendly to the *Americanos* were dragged into the piazza amidst the oaths and execrations of the guerrilla, and hisses and hootings from the mob. They were spit upon, called by filthy names, pelted with mud and melon-rinds, and then some of the crowd cried out to mark them, so that their friends the *Tejanos* should know them again. The women were more furious than the men, and excited the latter to the deed, calling to the blacksmith:

'*Traiga el fierro! traiga el fierro!*' (Bring the branding-iron!)

Others cried out: '*Sacan las orejas!*' (Cut off their ears!)

The brutal blacksmith and butcher, both half drunk, obeyed the call—willingly, Pedro alleged. The former used the branding-iron, already prepared, while the latter performed his bloody office with the knife of his trade!

Most of the guerrilleros wore masks. The leaders were all masked, and watched the proceedings from the roof of the alcalde's house. One Pedro knew in spite of his disguise; he knew him by his great size and red hair: it was the *salteador*, El Zorro. Others he guessed at; but he had no doubt it was the band of Don Rafael Ijurra—nor had we.

Had they left the rancharia before Pedro and the others came away?

Pedro thought not; he and the other victims, as soon as they got out of the hands of the mob, had fled to the chapparal, and were making for the American camp when met by our scouts. They were straggling along the road one after the other; Rube had detained them by the rancho, till we should come up.

Pedro feared that they were not all—that there were other victims; the alcalde, he feared, had been worse than mutilated—he had been murdered.

This last information the poor fellow imparted in a whisper—at the same time casting a sorrowful look towards Conchita. I had not the courage to inquire farther.

The question arose whether we should send back for more men, and wait till they arrived, or advance at once to the rancharia. The former was negated with unanimous voice. We were strong enough, and vengeance was impatient. I was joyed by the decision; I could not have waited.

The women were directed to continue on to the ranger-camp; Pedro, mounted behind one of the men, should go with us. We needed him for purposes of identification.

We were about to move forward, when a figure appeared along the road in the direction we were going to take. On coming within sight of us, the figure was seen to skulk and hide in the bushes. Rube and Garey ran rapidly forward, and in a few minutes returned bringing with them a Mexican youth—another of the victims!

He had left the scene of his sufferings somewhat later than the rest.

Was the guerrilla still in the place?

No; they were gone from the village.

'Whither?' was the anxious interrogatory.

They had taken the up-river road, towards the hacienda de Vargas. They had passed the boy as he lay concealed among some aloes; he had heard their cries as they rushed past.

'What cries?'

They shouted: '*Mueran al traidor y traidora! Mueran al padre y hija! Isolina la p—t—a!*'

'O merciful God!'

A FISH WITHOUT A POSITION.

WHAT'S in a name? I asked myself contemptuously as a passer-by exclaimed: 'What an odd fish!' Now, what is an odd fish? 'He whose father was a good old sole, and his mother a little common plaice,' a punster might reply; but not so the frequenters of the Crystal Palace: these will tell you that I am the oddest of odd fish, and that of all the wonders locked up in the water—that great storehouse of nature—there is none greater than myself. Perhaps, kind human, you may not have been among the number of my visitors, and consequently may not have seen me in the Crystal Palace, in one of those watery prisons called aquariums, where my confinement is rendered still more irksome by the gold and silver fish which share my captivity, only, like pert lackeys, to dazzle my eyes by their tinselled liveries, and disturb my repose by their purposeless activity. To you, then, to whom I will presume myself a stranger, I introduce myself as the *Lepidosiren anectens*, or mud-fish, whose ancestral home is in the river Gambia, and whose power of adaptation is so great, that, on the subsidence of the stream, it forms for itself a membranous covering, and enshrouding itself, Cheops-like, in a cocoon of mud, awaits on the river's bank the return of the waters, continuing frequently for eight months in a state of torpor.

To exchange a mud-hut for a palace of crystal may be thought an exaltation not to be despised; but it was not thus with me. My Egyptian bondage was light indeed, compared with the confinement of the voyage, and the subsequent suffering in the Crystal Palace; where I was placed by Captain Chamberlayne, about six months since, in company with two other mud-fish, and the mummy of a grandfather, whose sarcophagus and remains you may see, alas! at the foot of my aquarium. It is not, however, the bodily suffering of which I complain, though I have had enough of that; no, rather it is the mental disorder—the disorder so prevalent in England, and so dreaded

by her children—I mean the want of position. We mud-fish had no acknowledged and recognised place. We were like too many whom we saw around us, odd fish like ourselves—perhaps like you, dear human—gasping and struggling for a position, dreading nothing so much as to lose their place in society; nay, we were more to be pitied than these, for we had no position to lose; we were not even classed in the great family of nature. When we claimed to belong to the fishes, we found that our anatomy more nearly allied us to reptiles; when we would have settled on the earth, we were sent back to the Gambia. All this was the more trying, because, some ten years since, a mud-fish had been brought over, and its habits, structure, and peculiarities had been subjects of investigation and speculation. We might, therefore, have reasonably expected our proper place assigned to us immediately on our arrival in England. Not so, however. We were no sooner placed in our new abode, than we found ourselves in the hands of that great reigning power Science—science, who is ever seeking to enlarge her dominion and increase her subjects; ever investigating, and never wearying; examining all causes, judging all effects, despising no means, compassing all ends. We became, then, subjects of science. The naturalist examined our four propellers—scarcely legs, scarcely fins—our snake-like body, and animal head; the medical world descanted on our lungs and digestive organs; and the mechanist commented on our rudder-like tail and peculiar 'build;' and so the scientific world discussed, and the everyday world wondered, and the ignorant world laughed; and to-day we are fishes; yesterday, we were reptiles; to-morrow, perhaps, we shall be mere links!

There were not those wanting who tried to find a family likeness for us in England; some asserting that Camden and Fuller had made mention of us among the worthies of Lancashire: the one saying that 'at a place called Sefton in the above county, upon turning up the turf, men find a black deadish water, with small fishes therein;' and the other, that 'the men of this place go a-fishing with spades and mattocks.' Some, again, traced in us a strong resemblance to eels. Now, this comparison would have been odious to us, had not the eel been called by the ancients the offspring of Jove, and had it not, too, been consecrated by Roman tears; for it was when Crassus was reproached in the senate, by Domitius, with 'Foolish Crassus! you wept for your murena' (or lamprey), that Crassus retorted: 'That was more than you did for your two wives.' Eels, therefore, are a matter of history, and, so far, we were not offended; but when we were associated with lizards, and even the low-bred, ditch-loving newt, our indignation knew no bounds. We are not cold-blooded—no, by the three ventricles of our African hearts, the blood of the Pharaohs boiled within us at the insult offered to the mummies of our ancestors! Disputes without soon created dissensions within, and our new abode became the scene of many quarrels. Our morning meal of frogs was seldom partaken of without contention; and one day, in a frenzy of passion, I fell upon and devoured one of my companions, which had raised a question about my fins. This act of fury was much resented by my remaining relative, which sought many occasions of revenge, and spent his miserable existence in reviling at me and at fate, and in pining for his native mud; until one day, a desperate leap into the tank below, saved him at once from my pursuit and the investigation of science. He sleeps, as I understand, at the bottom of the tank—it may be, in a cocoon of English mud. Meanwhile, I, sad, solitary, and almost blind, drag on my wretched life, a creature without a position, an intermediate form, a chrysalis of the waters, neither flesh nor fowl, perhaps not even an 'odd fish.'

THE EVENING-STAR.

THE evening-star watched by the moon,
In a sweet trance of sad devotion;
Still fond and faithful all alone,
Within the heaven's wide ocean—
Alone, untiring in her love,
She sat while dews were round her weeping,
'Mid all the heavenly sentinels,
The only one unsleeping.

Thus I will be, dear love, to thee,
When night and loneliness enfold thee;
Still whispering low and fervently,
What in bright days I told thee—
Still gazing from my heart of hearts,
On that loved face divinely beaming,
'Mid world and worldlings all alone,
Wrapped in my golden dreaming!

E. O. D.

PARADISE OF THE OLD.

I have no means of obtaining any satisfactory data to shew the proportions which different ages bear to another in China, or the average mortality at different periods of human life; yet to every decade of life the Chinese apply some special designation. The age of 16 is called 'the Opening Degree;' twenty, 'Youth expiring;' thirty, 'Strength and Marriage;' forty, 'Officially Adult;' fifty, 'Error-knowing;' sixty, 'Cycle-closing;' seventy, 'Rare Bird of Age;' eighty, 'Rusty-visaged;' ninety, 'Delayed;' one hundred, 'Age's Extremity.' Among the Chinese, the amount of reverence grows with the number of years. I made, some years ago, the acquaintance of a Buddhist priest living in the convent of Tien Tung at Ningpo, who was more than a century old, and whose people of rank were in the habit of visiting, in order to shew their respect and to obtain his autograph. He shewed the civility to give me a very fair specimen of his writing. There are not only many establishments for the reception of the aged, but the penal code provides special punishments for those who refuse to relieve the poor in their declining years. Age may also be pleaded in extenuation of crime and in mitigation of punishment. Imperial decrees sometimes order presents to be given to all indigent old people in the empire.—*Sir John Bowring in the Transactions of the China Branch of the Asiatic Society, Part V.*

DRESS-PARTIES IN ANCIENT EGYPT.

One very usual subject in the tombs, is the reception of guests at a party; and Egyptian artists, fully alive to caricature, have sometimes shewn that the little follies of gossip, display of finery, and conceit, were as common those days as in later times. Here, a man of fashion arriving in his curriole long after the other guests assembled, thinks to increase his consequence by affectation, as well as by the number of his attendants running-footmen; there, women examine, with the eye envious or curiosity, the jewellery of a neighbour; and profusion of gold and silver vases set out on the sideboard proclaim, by their utter uselessness on the occasion, the love of display alone procured them a place in the festal chamber. In another place, the consequence of a master and mistress of the house is indicated by submissive obeisance made to them by the dancers, musicians hired to entertain the company; and as the principal people who gave these entertainments were of the priestly class, we learn, that however they may lecture the people on the propriety of considering this a mere passage to a future state, and of mortifying their appetites for pleasure, they were themselves by no means averse to the good things of this world, and enjoyed the comforts like the rest of the community.—*Wilkinson's Egyptians in the Time of the Pharaohs.*

PRICE 1½d.

CAPTAIN DODD AT SEA.

In the year 1813, there was launched upon the Clyde a vessel, whose name, when the history of ocean steam-navigation comes to be written, will be honourably remembered in connection with the first steam-voyage upon British seas. This vessel was the *Argyle*, a packet of seventy tons' register, measuring in her keel twenty-nine feet, with sixteen feet of beam, and fitted with engines of fourteen horse-power, and paddle-wheels of nine feet in diameter. She had two cabins—one in the fore-castle, the other in the stern. In her *raist* was the engine, with the boiler on the starboard side, and the cylinder and fly-wheel on the larboard. Her smoke was carried off by a funnel, which also did duty as a mast, and was rigged with a large square sail. A gallery, upon which the cabin-windows opened, projected on each side so as to form a continuous deck, interrupted only by the paddle-boxes—an arrangement which had the further effect of making the vessel appear larger than she really was. On the outside of the hull, eighteen large port-holes were painted, which, with the two she displayed upon her stern, made the *Argyle* look so formidable to those to whom a steamer was a novelty, that it was stated in a Committee of the House of Commons by several naval officers that, if they had met her at sea, they would have endeavoured to reconnoitre before attempting to bring her to.

The packet, such as we have described her, had been plying for a year between Glasgow and Greenock, when she was purchased by a London company with the intention of running her between that city and Margate. But a serious difficulty had first to be overcome. It was necessary to bring her round by sea from the Clyde to the Thames; and, notwithstanding the success which had six years before attended the enterprise of Stevens of Hoboken in navigating a steamer from the Hudson to the Delaware, it was the general opinion of nautical men that vessels of the new construction were unfitted to brave the open sea. There was then in London a man of the name of Dodd, who had served in the navy, had afterwards distinguished himself as an engineer and architect,* and who, finally, driven by misfortunes to intemperance, almost literally died in the streets a beggar. To him the task was intrusted. Dodd accordingly arrived in Glasgow in April 1815, and with a crew of eight persons—a mate, an engineer, a stoker, four seamen and a cabin-boy, boldly put to sea about the middle of May. His

voyage at first was far from auspicious. The weather was stormy, the sea ran high in the strait which separates Scotland from Ireland, and, either through ignorance or negligence, the pilot during the night altered the course of the vessel, so that they ran a great risk of being wrecked. Dodd tells us that he had given orders that the steamer should be steered so as to gain the Irish coast by the morning; but at break of day a heavy gale was blowing; and it was discovered that, instead of being off the coast of Ireland, they were within half a league of a lee-shore, rock-bound, about two miles to the north of Port-Patrick. To attempt to beat off, in the teeth of the gale, by the united power of steam and sails, Dodd found to be impossible. Depending, therefore, entirely on the efficiency of his engine, he laid the vessel's head directly to windward, and ordered the log to be kept constantly going. The plan succeeded. The vessel began slowly to clear the shore, going direct in the wind's eye at the rate of something more than three knots an hour. Having thus acquired a sufficient offing, he bore away for Loch Ryan, and gained the Irish coast. On the 24th of May he entered the Liffey, being firmly of opinion that no other power than that of steam could have saved the vessel from destruction.

We have hitherto followed the account of the voyage as published by Dodd himself in the *Morning Chronicle* of June 15, 1815, and as afterwards embodied in his evidence before a Committee of the House of Commons. Henceforth, however, in recounting the further fortunes of the adventurers, we shall avail ourselves, in preference, of the equally authentic, but far more picturesque narrative of Mr Weld, the secretary and historian of the Royal Society, by whom Dodd was accidentally joined in Dublin. The following extract from that gentleman's journal at once exhibits his reasons for embarking in the enterprise, and describes very pleasingly the excitement caused in the Irish capital by the arrival of the *Thames*, as Dodd, before leaving Glasgow, had re-christened the *Argyle*:

'On the 25th May 1815, I heard by accident that a steam-vessel had arrived at Dublin. I immediately went to see her, and found her on the point of starting with a number of curious visitors upon an experimental trip in the bay. I was so much pleased with all that I saw and heard concerning her, that, having previously intended to proceed to London, I determined to request Captain Dodd to receive me as a passenger, and to be permitted to accompany him throughout the voyage. He at once consented; and my wife having resolved on sharing the dangers of the voyage with me, we proceeded to make the necessary arrangements for our departure'—arrangements which, we may add

* He projected the Thames Tunnel, proposing to carry it from Rotherhithe to Tilbury at an estimated cost of under £1,000,000.

parenthetically, comprehended all and probably more than would now be required for a voyage to America. 'On the 28th of May, being Sunday, we left the Liffey at noon. Many persons embarked with us from curiosity, but only to cross the bay as far as Dunleary [now Kingstown], where they landed. Unfortunately, the sea was very rough, which occasioned the most violent sea-sickness amongst the passengers. Several naval officers were on board, who were unanimous in declaring it to be their firm opinion that the vessel could not live long in heavy seas, and that there would be much danger in venturing far from shore. I deemed it right to inform my wife of this opinion; but, although she suffered greatly from sea-sickness, she persisted in her intention of accompanying me; and that evening, after having passed some hours on land at the house of a friend, the vessel put to sea, we being the only passengers. The shore was covered with several thousands of spectators, who cheered and wished us a prosperous voyage.'

The sea was comparatively calm as the vessel steamed into the Bay of Dalkey, and the passengers calculated on a pleasant voyage during the night; but when beyond the shelter of the coast, they found it to be as rough as ever. 'The motion of the vessel differed essentially from that of a sailing-vessel; the action of the wheels on the water at each side prevented her rolling. The most disagreeable movement was felt when the waves struck the vessel on the beam; but even then, her peculiar construction was advantageous, for the coverings which enclosed the wheels acted as buoys, and contributed to keep the vessel afloat. On such occasions, the noise produced by the sudden compression of the air within the wheel-boxes was frightful. After having sustained a concussion on one side, a second was generally felt on the other by a sort of reaction, and a third, but much more feeble, succeeded, after which the vessel preserved a regular motion for several minutes. I do not recollect ever experiencing more than three of these concussions in rapid succession, and their invariable effect was to terminate the rolling motion, which sometimes lasts a long time in sailing-vessels. It cannot be denied that the concussions occasioned temporary alarm, accompanied as they were by the noise which has been mentioned, and by the shaking of the whole vessel; but no permanent inconvenience resulted: on the contrary, the equilibrium, as I have stated, was soon re-established, and the vessel, as sailors say, pursued a *dry course*, bounding so lightly over the waves that during the entire voyage we were not once wetted even by the spray.'

The voyagers soon left far behind them all the vessels which had sailed from Dublin with the same tide, and the following morning about nine o'clock were off Wexford. The dense smoke which issued from its mast-chimney being observed from the heights above the town, it was concluded that the vessel was on fire. All the pilots immediately put off to its assistance; and nothing could exceed their surprise, mingled with disappointment, when they saw that the ship was in no danger whatever, and that their hopes of salvage were at an end.

The weather had now become so stormy, that Captain Dodd determined to put into the port, his great object, as Mr Weld says, being to navigate the vessel safely to London, rather than, by using great dispatch, to expose her to unnecessary risk.

At two o'clock in the morning of Tuesday, May 30, Dodd put again to sea, and steered for St David's Head, the most westerly point of Wales. During the passage across St George's Channel, one of the blades of the starboard paddle-wheel got out of order. The engine was stopped, and the blade cut away. Some hours after, a similar accident befell the larboard-wheel, which was remedied in the same manner. The loss of

one blade in each paddle made no apparent difference in the progress of the vessel. Fortunately, when the accident occurred, the sea was very calm, and all the shoals had been passed.

About two o'clock in the afternoon, twelve hours after leaving Wexford, the steamer reached the Pass of Ramsay, between the island of that name and St David's Head. There the adventurers remained for three hours to oil the engine, and to give the steamer who had not quitted his post for an instant since leaving Wexford, a little rest. There, too, as at Wexford, boats put out from different parts of the coast to the assistance of the vessel, which they believed to be on fire. Leaving Ramsay, they commenced steaming through the straits and across St Bride Bay. The weather had now become unfavourable, and the sea ran alarmingly high in the bay. 'The waves, indeed, were of such magnitude, that when engulfed between them, the coast, although very high, could not be seen; but the vessel held her way most gallantly over all.' A small fleet of merchant-vessels left the Straits of Ramsay with the voyagers; but the passage of the bay alone, the latter had left them so far behind, as to be able to see only their masts.

On the south side of St Bride's Bay, between Skom Island and the mainland, there is a dangerous passage called Jack Sound. Their pilot warned them against attempting this passage excepting at high-water, and with a favourable wind, as there were several formidable whirlpools which would seize the vessel, and carry her on the rocks. Captain Dodd, however, who trusted the power of his engine, insisted on going through the sound, in order to save five hours and another night at sea. 'The pilot,' says Mr Weld, 'reiterated his remonstrances, at the same time trembling with fear; but we passed through all the whirlpools with the greatest ease. Nothing, however, can be conceived more frightful than the aspect of some of the rocks, and especially of those called *The Bishop and his Clerk*, which are the scene, annually, of numerous shipwrecks. Had we been in a sailing-vessel, our position would have been most perilous; but our steam was all-powerful, and brought us safely into Milford Haven. As they were steaming up the harbour, they met a government mail-packet proceeding from Milford Waterford with all her sails spread. They had passed her about a quarter of a mile, when Captain Dodd determined to send some letters by her to Ireland. The *Thames* was immediately put about, and in a few minutes she was alongside of the packet-ship, and sailed round her, notwithstanding the latter continued under-way. The captain and passengers wrote a few letters, put them on board the packet, sailed round her once again, and then continued their course to Milford.

During the whole of the 31st of May and the 1st of June, the adventurers had ample occupation in Milford in satisfying the curiosity of numerous naval officers who were anxious to see the *Thames*, and to examine her engine, as well as to test her marine powers. It became necessary also to cleanse the hull, which had not been done since leaving Glasgow. She had appeared to Mr Weld on the passage that it was becoming filled by degrees with salt, and he had questioned the engineer on the subject, but had been assured that not an atom had been formed there. Of course, when the boiler was examined, it was discovered that Mr Weld was right, and the engineer wrong.

Late on the evening of the 31st, they again put to sea, in company with the *Myrtle* sloop-of-war, the captain (Bingham) and a company of ladies aboard the steamer, anxious to see how she would behave in a rough sea. The *Myrtle* was obliged to hoist royals and studding-sails to keep up with the *Thames*, and at last, crowding all sail, she could get very little ahead. 'Had the steam been fully up,' says Mr Weld in a private letter, 'we should

beaten her. But our great superiority was yet to be shown. Dodd, in his gallantry, determined to carry the ladies back to Milford, instead of consigning them to an open boat; which he accordingly performed, and left the sloop-of-war far behind; and when we returned to go to sea, we found she had anchored, being unable, owing to the failure of the wind, 'to reach her former station.'

On Friday morning, the voyagers were in the middle of the Bristol Channel, with no land visible; but towards evening, they discovered the high coast which terminates England on the west. As the weather, however, again assumed a gloomy aspect, their new pilot—for the other had been discharged at Milford—judged that it would be imprudent that night to double the Land's End, so that Dodd determined to shape his course towards St Ives. On approaching the shore, a crowd of small vessels was seen making towards the steamer with all possible speed by means of sails and oars. At St Ives, as elsewhere, the alarm had been taken on seeing a vessel, supposed to be on fire, steering towards the town, and all the disposable craft immediately put to sea. 'The pilot-boats of this station,' says Mr Weld, are, without exception, the finest I have ever seen. They carry two sails and six rowers. When they were told that we did not want them, they tacked about, and severally sought to out sail each other. In the course of about seven miles, we outran all of them upwards of a mile. These sea-faring men then told us, that our vessel was the first that could surpass them in swiftness, and that they easily approached ships-of-war and custom-house cutters, which are deemed the quickest sailers. All the rocks commanding St Ives were covered with spectators; and when we entered the harbour, the aspect of our vessel appeared to occasion as much surprise amongst the inhabitants as the ships of Captain Cook produced amongst the islanders of the South Sea. This was no novelty to us, for wherever we had coasted along, we were the object of equal astonishment, until the public papers, in announcing the arrival of a steam-boat in the Irish Channel, and giving some explanation of the mode in which the vessel was moved, in some measure diminished the wonder of the spectators, though not their curiosity.'

As the port of St Ives affords no shelter from the north-east wind, and as it began to blow very heavily when that point, it was found advisable to carry the vessel into the port of Hale, four miles distant, where the anchor was cast at the mouth of the river, in a position of perfect safety.

The operation of doubling the Land's End had from the first been represented as by far the most difficult and dangerous part of the voyage; and Mr and Mrs Weld had accordingly gone across the neck of land to the south coast, where they thought of remaining until the vessel came round. But as one of the motives which had led them to undertake the voyage was its novelty as well as its novelty, they resolved, instead of waiting for the *Thames*, to return to Hale, and to save with the steamer's crew the dangers of the passage round the Land's End.

At four o'clock on Monday, the 5th of June, the weather appearing milder, they accordingly re-embarked; but in doubling Cornwall Head, the most northern of those two great promontories which terminate England on the west, a tremendous swell from the Atlantic met them, whilst the tide, which ran strongly down St George's Channel, combining with the swell, raised the waves to such a height, as to render their position in the highest degree alarming. The vessel seemed to suffer considerably, and the repeated collisions against the paddle-boxes terrified the pilot, who now heard them for the first time. Night approached without any port being within reach,

excepting that which they had left, and which was now too distant to think of regaining. Such was the state of things, when 'Captain Dodd observed that the vessel sailed better before the waves than in any other direction; he therefore spread some sails, and made a long tack, close-hauled, so as to get out of the latitude when the swell struggled against the tide; and at the end of some hours, we doubled the Land's End, and found ourselves in a comparatively tranquil sea. We were then at the entrance of the British Channel, which is always calmer than the Irish Sea; the sun shone out in great brilliancy, and the coast unfolded all its beauties of woods, villages, and rich cultivation, as we glided along.'

At eleven o'clock in the morning of Tuesday, June 6, the adventurers arrived at Plymouth. The harbour-master, who had never seen a steam-vessel before, was as much struck with astonishment when he boarded the *Thames*, as a child is in getting possession of a new plaything. 'The sailors ran in crowds to the sides of their vessels as we passed them, and mounting the rigging, gave vent to their observations in a most amusing manner.'

The whole of Wednesday was taken up in shewing the capabilities of the steamer to the port-admiral and to the naval officers who went on board.

At noon on the following day they left Plymouth, and steamed, without interruption, to Portsmouth, where they arrived at eleven o'clock in the morning of Friday, having accomplished 155 miles in twenty-three hours.

At Portsmouth, astonishment and admiration were, if possible, more strongly evinced than elsewhere. Tens of thousands of spectators assembled to gaze at the *Thames*; and the number of vessels that crowded around her was so great, that it became necessary to request the port-admiral to assign the voyagers a guard, in order to preserve some degree of order. They entered the harbour in the most brilliant style, steaming in, with the assistance of the wind and tide, at the rate of from twelve to fourteen miles an hour. A court-martial was sitting at the time on board the *Gladiator* frigate, but the novelty of the steam-boat presented an irresistible attraction; and the whole court went off to her excepting the president, who was obliged by etiquette to retain his seat until the court was regularly adjourned.

On Saturday, the 10th of June, the port-admiral, Sir Edward Thornborough, sent his band and a guard of marines at an early hour on board, and soon afterwards followed in person, accompanied by three admirals, eighteen post-captains, and a large number of ladies. The morning was spent very pleasantly in steaming amongst the fleet, and running over to the Isle of Wight. The admiral and all the naval officers expressed themselves delighted with the *Thames*.

From Portsmouth the steamer proceeded to Margate, which was reached on Sunday morning the 11th, where she remained until the following day, when the captain and passengers embarked for their final trip, at half-past eight in the morning, and about six in the evening arrived at Limehouse, where they moored. As usual, they passed everything on the Thames—all the fast-sailing Gravesend boats, pleasure-boats, West-Indiamen, &c. The following table, taken from Mr Weld's journal, shews the distances from Dublin in nautical miles, and the time occupied in performing them: From Dublin to Kingstown, 8—1½ hours; Kingstown to Wexford, 67—13¼ hours; Wexford to Ramsay, 63—11 hours; Ramsay to Milford, 18—4½ hours; Milford to St Ives, 110—19 hours; St Ives to Plymouth, 118—19 hours; Plymouth to Portsmouth, 155—23 hours; Portsmouth to Margate, 129—20½ hours; Margate to Limehouse, 90—9 hours; total, 758 nautical miles—121½ hours. The *Thames*, we may mention, carried fifteen tons of coal, her

consumpt being, on the average, a ton for every hundred miles. The distance between Portsmouth and Margate was, however, performed with an expenditure of something less than that quantity.

So ended this memorable voyage, the first, if we except the comparatively insignificant adventure of Stevens in America, ever performed by a steam-boat on the open seas. And it seems strange that, with such satisfactory practical evidence in favour of ocean steam-navigation, steam-packets were not at once adopted, and that it should have been left for a Scottish company in 1818 to institute a line of steamers between Greenock and Belfast, the first of which, the *Rob Roy*, of about thirty horse-power, and ninety tons' register, was built and launched by David Napier in that year.

A MOTLEY COLLECTION OF MOTTOES.

THE honourable and facetious Judge Haliburton, in the course of an address lately delivered by him at Manchester, is reported to have said, among other sly pokes in the national ribs which he took the opportunity of administering, that he had been 'a good deal amused by looking over a book that applied to no part of the world but England, called the Peerage-book, and reading the quaint mottoes of the nobility contained therein.' I confess to having been inexpressibly shocked when I read this irreverent paragraph. My attention was called to it by the extraordinary demeanour of my wife. Instead of the calm and supercilious glance with which that exemplary and highly connected woman usually skims through the columns of the *Morning Post* not containing the fashionable intelligence, I observed with astonishment that her light-blue eyes flashed with indignation, her aquiline nose curled with scorn, her flaxen ringlets quivered with emotion, and her whole slim and aristocratic, not to say bony, person underwent the feminine and expressive operation of 'bridling up.' And no wonder! Every right-minded and well-regulated British matron would shudder with horror at such an unprincipled attack upon her favourite reading. Oh, sacrilegious Sam Slick! when you can connect the awful volume that forms a manual of devotion to thousands of the best families in England, with anything so low as fun or amusement—when you can treat the idol before which society, in this country, bows down and worships, with no more respect than if it were a ridiculous Chinese *joss*, your organ of veneration must, I fear, be very imperfectly developed. And oh, ye men of Manchester! oh, ye profane cotton-manufacturers! ye have much to answer for, if, as is reported of you, ye encouraged the colonial wag with shouts of applause! 'No, no, Justice Haliburton,' I indignantly exclaimed. 'You may laugh, and welcome, at our Peace Society—you may twit the heads of our colonial department with knowing nothing whatever about the colonies intrusted to their charge—you may crack your jokes about our army administration—you may even quiz our prime-minister! but there is one thing you may not do—you may not make fun of our Peerage-book: that time-honoured institution, at least, must be held sacred.'

Such were my sentiments as I laid down the newspaper and opened Debrett, with a view of refuting the aspersions that had been cast upon its aristocratic pages. I say *were*, because, to my astonishment, I discovered that the illustrious Clockmaker was right. The mottoes of the nobility are quaint—very quaint. There are between 400 and 500 of them, and an exceedingly queer and miscellaneous jumble of odd-ends they are—quite a literary hotch-potch, consisting of moral maxims, quotations from Horace, specimens of alliteration, battle-cries, jingling rhymes, patriotic sentiments, atrocious puns, and wise saws, in all languages—ancient, modern, and mediæval.

Latin appears to be the favourite heraldic dialect, and then French; English comes third; and the remainder are in Irish, Gaelic, Welsh, Italian, Spanish, and Greek. Of Irish mottoes, there are three specimens. *Lam dearg Erin* is the red hand of Ireland that distinguishes the Lords O'Neill; and *Crom a boo* and *Shannet a boo* form the war-cries of the Duke of Leinster and Lord Fitzgerald and Vesey. *A boo*, which we recognise at once, from its eccentric termination, as a sample of the purest Milesian, means *for ever*; and *Crom* and *Shannet* are names indicating the respective families to which they belong. *Crom* was a castle in the county Limerick, that formerly belonged to the Dukes of Leinster. Of Italian mottoes, there are two instances—that of the Dukes of Bedford, *Che sarà sarà* (What will be, will be), and Lord Dormer's *Cio che Dio vuole, io voglio* (What God wills, I will). The only Spanish one belongs to the Duke of Marlborough: *Fiel pero desdichado* (Faithful though unfortunate). Greek gets only half a motto, but of that I shall have occasion to speak hereafter; and the English, French, and Latin ones are, like the advantages in an auctioneer's advertisement, 'too numerous to particularise.' The gems of the collection, however, that I have kept for the last as a kind of *bonne bouche*, are undoubtedly Welsh. I warn the reader beforehand not by any means to attempt to pronounce the fearfully and wonderfully constructed syllables I am about to place before him. He is merely to wonder at and admire them, as he would some rare and curious animal in the Zoological Gardens, which he is requested by the keeper not on any account to touch. For instance, would anything short of a tetanic convulsion of the epiglottis produce the sounds necessary to convey the meaning—if meaning it have—of Lord Mostyn's motto: *Heb ddw Hddym Ddwadyddan*? Six poor unfortunate little vowels to eighteen tall consonants! They are like Falstaff's 'half-pennyworth of bread' to his intolerable quantity of sack. In the subscription of Lord Dinorben's coat-of-arms, *Rhad dw a rhyddid*, they are jostled in even more unmannerly way. If mottoes are to be considered in any degree emblematical of the dispositions of their owners, the Welsh noblemen must be very eccentric characters indeed!

After a careful perusal of the Peerage-book—and a very fatiguing operation it is—I find that the mottoes of the nobility may be divided into five distinct classes: the highly moral, the characteristic, laconic, eccentric, and comic.

The first-mentioned class, I am happy to say, greatly preponderate. Under this head I include the loyal, patriotic, philanthropic, and sentimental. *Dies et nox dicit* heads a long list of equally pious and moral sentiments; and there are no less than thirty mottoes commencing with the word *Virtue*, and praising its beauty and power. Supposing each nobleman to adopt his own motto: 'Virtue,' says the Earl of Abingdon in Latin, 'is stronger than a battering-ram;' 'Virtue is a sheet-anchor,' cries Lord Gardner; 'It is equal in the opinion of Lord Howard of Effingham, 'to a thousand shields;' 'Virtue alone ennobles,' adds Lord Wallcourt; 'It overcometh envy,' exclaims the Earl of Cornwallis; 'It flourishes for ever,' chimes in Lord Belmore with enthusiasm. There is nothing like virtue, cry half-a-dozen other noblemen. *Virtus est fides, virtus et labor, virtus et the protection of Heaven*, 'virtue, and nothing but virtue,' sing the aristocratic chorus, is our 'watchword, our shield, our buckler, our guide, counsellor, and friend.' It is gratifying to know that faith is nearly as much appreciated as virtue by the hereditary nobility of England—*Faith and love, Faith and hope, Faith and courage, Faith and fortitude*, being the burden of a great number of their mottoes. The advantages of strength and courage are much insisted on, but generally in connection with

or more of the cardinal virtues. *Fortis et fidele* is the motto of Lord Talbot of Malahide; 'Nothing is difficult to the brave and faithful,' embodies the principle of Lord Muskerry. Honour and honesty are of course in great request: 'Honour is the reward of virtue,' says the Earl of Ferrers, and 'of fidelity,' adds Lord Boston; *Honesta quam splendida!* ejaculates Viscount Barrington in a burst of admiration—'How magnificent are the acquirements of honour!' Others breathe the most devoted loyalty, the most exalted patriotism, the purest philanthropy—in fact, if the English nobility only act up to their mottoes, the House of Lords must be a perfect tabernacle of goodness!

Characteristic mottoes are principally the property of illustrious naval and military heroes, or distinguished lawyers, who have been raised to the peerage for professional achievements. Thus, Lord Nelson's was *Palma qui meruit ferat*, although a more appropriate one for Britain's greatest naval commander would have been the immortal sentence imperishably connected with his name: 'England expects that every man will do his duty.' The Duke of Wellington's, *Fortune, the companion of valour*, though applicable enough to the great captain's career, bore no reference to his deeds of arms, it having been used by his family for many generations. The *Avancez* of Lord Hill is a model motto for a soldier—short, sharp, and decisive; and Lord Hood's *Ventis secundis*, a sailor's grateful expression of how much he was indebted to the fickle element for his success. Now-a-days, however, an admiral would be more inclined to sing the praises of steam. Peers sprung from the law have been generally either practical or legal in their choice of a sentence to illustrate their escutcheon. Thus, the dignity of labour is asserted in the *Labore* of Lord King, and the *Labor ipse volupatus* of Lord Tenterden. Lord Abinger's is *Suis stat viribus* (He stands in his own strength). Lord Brougham is for 'The king, the law, and the people;' Earl Camden, 'The judgment of our peers, or the law of the land.' Lord Ellenborough, whose patronymic was Law, and who may be said to have been so both by name and nature, selected *Compositum jus fasque animi*, which Debreit rather freely renders, Law and equity. Lord Erskine, in his motto, upholds *Trial by Jury*; and in *Ultra pergere* (to push on and keep moving) is exhibited Lord Lyndhurst's love of progress, and no doubt the secret of his high position. Bishops are supposed to be so upright and learned, so full of Latin, Greek, and morality, that they require neither mottoes nor supporters—at all events, they have none.

On the principle, I suppose, that brevity is the soul of wit, a number of mottoes consist of only one word. Lord Hawke has, very appropriately, a falcon for his crest, and *Strike* for his motto, as the first lord of that name did, most effectually, when he pounced upon the French fleet off the West Indies, in the year 1747. The adjective *Firm* characterises Lord Stair; and the word *Fight* appears to constitute the rule of conduct of the pugnacious Earls of Rosslyn. *Thus* is the extremely short and incomprehensible watchword of Lord St Vincent; and the *Through* of the Duke of Hamilton is only partly explained by his crest, which is a tree with a frame-saw nearly 'through' it. I have no doubt that thereby hangs a tale. Leaving the monosyllables, we come to the short but singularly expressive maxim of the Dukes of Buccleuch, who, judging from their motto, appear to think that the whole duty of man lies in the verb *Amo*. The Lords Dundas hopefully believe that all one has to do to get on in the world is to *try*—*Essayez* cry they, and I think they are right. The Earls of Elgin, descended from Bruce, are modest, yet proud: in *Fuimus* (We have been), they point, of course, to the fact that the Bruces were once the royal line of Scotland. *Grip fast*, say the tenacious Lords Rothes, whose crest, to harmonise with their motto, instead of a mild-looking demi-griffin

proper, should have been a bull-dog rampant. *I dare*, cries the bold Earl of Carnwath. *Je pense*, says the meditative Lord Wemyss. *Je pense plus*, replies the Earl of Mar, in a friendly spirit of emulation. *Lead on* is the war-cry of Lord Hotham, which is hardly so chivalrous as the *Follow me* of the Marquis of Breadalbane. *Ready, aye Ready*, is the characteristic motto of the Napier family. If a pen could be substituted for the crescent which, grasped by a hand, forms their crest, the sentence would be still more appropriate. *Agincourt, St Vincent, and Algiers*, are words commemorative of deeds performed by the ancestors of Lords Wodehouse, Radstock, and Exmouth. The motto of Lord Mexborough, *Be fast*, can hardly be considered good advice to the younger branches of the family, if the meaning of the word 'fast' be taken according to the modern acceptance of the term.

A great many will be found to merit more particularly the expression applied to them by the Attaché. The *Flecti non frangi* of Lord Palmerston is curiously opposed in spirit to the *Frangas non flectes* of the Duke of Sutherland. *Bella, horrida Bella* is the queer motto of the ancient family of O'Bryen; and *Let Curzon hold what Curzon held*, apparently points to some time when a Lord Howe, tenacious of his rights, refused to let go, or tried to get back, some family property. The quintessence of eccentricity, however, is displayed in the incomprehensible motto of the Marquis of Conyngham; no one but Sir Bernard Burke could unveil the mystery that lies hid in the words, *Over fork over!*

Others derive their claim to notice from an absurd jingle or alliteration which appears to have been the principal object of the original framers of mottoes. The *Numen lumen, astra castra* of the Earl of Balcarres is a specimen of the former, and *Dum spiro spero* of Viscount Dillon of the latter. A dozen such might be cited: the *Fortiter, fideliter, feliciter* of Lord Rathdown—*Un roy, une foy, une loy*, of the Marquis Clanricarde—*Data fata secutus, Non quo sed quomodo, Nunc aut nunquam, Via trita via tuta, Tâche sans tâche*; and many more.

I now approach a most distressing part of my subject. Dr Johnson's opinion of punning is well known. 'A man who would make a pun,' said the great lexicographer, 'would pick a pocket.' Judged by this standard, the morals of the ancestors of many of our highest nobility must have been in a most lamentable condition. Such a collection of flagrant quibbles and atrocious puns as are contained in the pages of Debreit, it has seldom been my lot to meet with even in *Punch*. There are some, indeed, which that privileged joker would not have the face to insert without the explanation, that they came from his insane contributor, or were dropped into his letter-box by some miscreant in the garb of a gentleman, who made his escape before a policeman could be found to take him in custody. The least harmless of these heraldic outrages is the double-faced motto of the Vernon family—*Vernon semper floret*, which may mean, as an interrogation, Does not the spring always flourish? or affirmatively, Vernon always flourishes. This is bad enough; but what will the unsuspecting reader say when I tell him that the motto unblushingly paraded before the world by the Lords Fortescue is *FORTE scutum, salus ducum?* or that *Cavendo tutus* is a feeble and unprincipled pun on the family name of the Duke of Devonshire, whose patronymic is Cavendish? In the same way, the paternal appellation of the Earl of Enniskillen being Cole, his motto is *Deum COLE, regem serva!* In the apparently innocent sentences, *Ne vile fano* and *Ne vile velis* are embodied, I regret to say, the family names of the Earls of Westmoreland and Abergavenny, Fane and Neville. In the laudable sentiment, *Nummi et patriæ astro*, the designation of its proprietor, Lord Ashton, is surreptitiously shadowed forth; and it is

difficult to believe that in the *TEMPLA quam dilecta* of the Dukes of Buckingham, their hereditary cognomen of Temple designedly lies hidden. The malice aforethought displayed in the *Fare fac* of Lord Fairfax, and the *Festina lente* of Lord On-slow, will rouse the indignation of all honest men. I have much pleasure in dragging the two following literary man-traps to light; they might perhaps escape the notice of a casual observer; but they are none the less dangerous for being cleverly concealed. Lord Falmouth's motto is, *Patientie passe science*, apparently indicating, in the French language, the simple maxim, that patience surpasses knowledge, but really covering an unworthy quibble on the word patience; and in Lord Maynard's *Manus justa nardus*, the first and last syllable of his name are contained in the first and last word of his motto. After this, I seem to lose all confidence in human nature. I look through Debrett with a jaundiced eye, and fancy I can detect a pun lurking under every coat-of-arms. I fear to trace the innocent-looking aphorism, Bear and Forbear, to its heraldic resting-place, lest I should discover that its accompanying crest is a bruin's head gules, or a couple of animals of the same species, standing on their hind-legs, and collared and chained *argent*, as supporters.

The first Marquis of Londonderry may have harboured no evil designs when he chose the motto *Metuanda corolla draconis*, but after the melancholy instances I have quoted, how can I be sure of his honesty? I know that an ancestor of his raised a troop of horse when Londonderry was invested in the reign of William III.—the family has always been a cavalry family—they have for supporters a couple of hussars, one on a bay, the other on a gray, *guardant*; what assurance, then, have I that in the words, 'a dragon's crest is to be feared,' a horrible *double-entendre* has not been perpetrated, and that the crest or plume of a *dragon's* helmet is not covertly alluded to? Again, is it my fault that I eye with suspicion the eccentric motto of the Lysaght family? Instead of being the exclamation of some member of a mediæval Peace Society inveighing against the atrocities of war, may not the words bear reference rather to a domestic combat, in which some noble and indignant husband has apostrophised his beautiful but rebellious better-half as 'Bella, horrida Bella?' The well-known fact that Arabella was a favourite name for high-born ladies during the middle ages, reduces almost to a certainty this dreadful suspicion. In the same way, I look at the *Reparabit cornua Phœbe* of Lord Polwarth as I would at a barrel of gunpowder. My distrust is painfully augmented when I discover that the feminine element preponderates to an alarming extent in his coat-of-arms. As a crest, I find a lady richly attired, holding in her right hand the sun, and in her left hand a crescent, while, for supporters, are two mermaids holding mirrors in their hands, *all proper*. Is not this confirmation strong that some subliminary Phœbe is thus obliquely hinted at? But I will not pursue this melancholy subject any further. There is no necessity to multiply instances of the mental imbecility that must have pervaded society in general, when such lamentable attempts at jocularly were current among the upper classes. They were, indeed, the dark ages. One more example, and I have done. As a crowning specimen of heraldic depravity, I place before the reader the most deep-laid and designing *double-entendre* that ever shocked the susceptibility of an unfortunate tuft-hunter. The family name of the Lords Henniker is Henniker-Major. Their motto is *Deus MAJOR columnus*, and not satisfied with this, over their crest is inscribed with shameless effrontery, and with total disregard of the aspirate, the audacious apothegm, *Τὸν ἀριστεῖν ἐνέκα!* Such atrocity requires no comment. It surpasses in duplicity the motto of the rich tobaccoist who, on the advice of a wolf in sheep's clothing calling

himself a friend, adopted as an inscription for the panels of his newly set up carriage, the appropriate but double-barrelled sentence, *Quid rides*. Punning in Latin is bad enough in all conscience; but there is one offence that evinces a greater amount of moral turpitude—a lower depth of mental degradation—and that is, punning in Greek! The police ought to interfere in such cases. I close Debrett with a sigh, and agree with Sam Slick that the mottoes of our nobility, as recorded in the Peerage-book, are decidedly 'quaint.'

DECLINED WITH THANKS.

THIS is the courteous phrase in which the impossible contributor is addressed by the universal editor, with the cool malignity, perhaps, in addition, of the editor's compliments; and it is like receiving your rich uncle's affectionate blessing as his last bequest, instead of something you had expected in the 3 per cents.

From the outside of the editorial letter, generally, nothing can be gathered except Hope, which builds her nest in the very loopholes of the direction, and in the official wafer whereon the name of the awful journal is inscribed. But sometimes the communication takes the form of a big parcel, with the indelicacy of 'Not approved' outside, so that the very postman sees it; and you know at once that it is your epic in twelve cantos, or your transcendental essay upon the Origin of Evil, come back to the talented author, with 'Two shillings, if you please, for overweight.' Or these immortal efforts never come back at all, from which circumstance you suppose them to be accepted, and take in the judicious periodical for three months running, whereas no expectation can have less grounds upon which to stand even on tiptoe. When you have written, at last, to know at what date to expect these lights to appear, and receive no reply, you request, in a great rage, that they may be returned immediately; whereupon you are informed by a neat lithograph, that the Megatherium Magazine is never answerable for its rejected manuscripts. Or, again, no lithograph comes; upon which you presently call at the sacred office, and a little boy standing upon his head behind the counter, reverses that position to inform you that he 'don't know nothing about no papers,' and then instantly re-performs his favourite feat. Nay, suppose—for we may suppose anything—that one of these deathless works is at length published—that you believe yourself to have laid the foundations of a colossal fortune as well as a posthumous reputation—and that, above all, you have made your friends believe so, too—how very distressing it is to be informed, and not without some little impertunity, that 'the circumstances of the Megatherium are such as to preclude any pecuniary compensation to its esteemed contributor.'

My favourite nephew, aged seventeen, being thwarted in his choice of a profession, which had fallen upon that of his beloved father, who keeps foxhounds, fined for himself, in the second place, upon literature, which he knew to be pursued by his gifted uncle, myself; and this was the dexterous way in which I threw him off that scent: I brought him into my study, and shewed him my largest desk, which has been to him, I know, from early youth an object of mysterious awe and reverence. 'My son,' said I—adopting the style of *Rasselas*, Prince of *Abyssinia*, the *Arabian Nights*, and Mr W. M. Thackeray, which I find to be as good as any for domestic didactics—'would'st thou learn how steep and slippery is the road to fame, read here: Thou seest before thee more than one hundred manuscripts, written with pain, research, and application, upon as many different subjects. This, where the lines run evenly, two and two, beginning at the same place and ending in a similar monosyllable, is poetry, the language of the gods; this, where the words are often underlined or italicised, in order to shew where the point lies more

perspicuously, is, of course, a humorous article; and this again, where the writing is interspersed with capital letters—such as Beauty, True, Undying, Ideal, Human, and the like—of course is a branch of metaphysics, at once the most useful and the most entertaining of sciences. Essays, sermons, statistics, novels, poems, and tragedies, I have tried my hand at all of them, and not, in my opinion, without credit.'

'I see,' cried the impetuous youth—'I see,' while his heart beat high with a noble emulation; 'and why should not I do the same as you, nunkey?'

'Listen!' said I solemnly. 'When I was your age, I had already written as much again as you see here. At eight years old, I composed a heroic poem upon the subject of Hengist and Horsa, our early conquerors; at nine, an essay upon their respective characters; at ten, a tragedy, terminating in their deaths. I did not fetter myself pusillanimously with the actual facts, but caused the royal brothers to expire at an eating-match for the sovereignty, in the presence of their assembled nobles. *These three works are still in manuscript—unseen, unpublished, and unacted.* During the above period, I answered the ornithological conundrum of the Cottage Beehive, in hopes of obtaining its premium of a thousand copies, which, however, was "awarded to our clever young correspondent B." It was awarded, my son; but whether it was ever given to B. or not to B.—as the poet says—or whether B. existed, that is a question.

'I composed also more acrostics for the Conservative journal of my native county than you would easily imagine, and transferred them—upon rejection by that malignant print—to the Radical organ, which infidel and revolutionary paper refused them likewise. I have, I flatter myself, at various times, written under the protection of every letter in the alphabet; but "D. A. M." was invariably reminded that blasphemy was not wit; or "K. I. S.," that there was a point where gaiety degenerated into indecency. Nor was I more fortunate in my more ambitious aliases. "Quill Pen" was always told to mend himself; "Juvenis," to buy a spelling-book; and "Paterfamilias"—for in despair I tried that once—to stick to his home-affairs, and leave off writing rubbish. The idol of my heart was still, however, the periodical press; and I rose from beneath the wheels of its Juggernaut-car a wilder devotee than ever. The hopeless passion of appearing in print was born with me, I believe, just as much as our family name of Waggles; and it is not more likely to depart, than for the Queen, unsought, to grant me her letters-patent to assume the arms and title of Montmorenci. My genius, my enthusiasm, upon every subject was ready laid—as the housemaids say—and only required the lucifer-match of sympathy, applied by my dear mother, to cause it to burst forth into manuscript. She considered—bless her loving soul!—my Hengist and Horsa to be upon a level with any of the historical plays of Shakspeare; while your respected grandfather, whose tracts, as you remember to have heard, have had a European, and even an African reputation, and who disinherited your papa for keeping hounds, insisted that there was not enough of the religious element in either author. His connection with the Weekly Scourge for Sinners, was not of the smallest use in introducing me into that periodical, an amusing little sketch which I had sent for consideration being returned by the editor with a marginal request, written in red ink, that I should take care of my precious soul.

'You have heard it often remarked in your domestic circle that Uncle Waggles has written for the *Times* for many years, and you perhaps have revered him accordingly: be sure that it is for your good, then, that I now confess to you that the effect of these epistles—except in their secret influence upon the mind of the editor—has not been great, nor certainly of a general nature. Whenever a grievance has been

detected, at home or abroad, or the least excuse has offered itself for addressing the leading journal, I was always indeed the first as well as the last in the field of correspondents; but the letters were none of them ever published. The Family Hodge Podge, yonder, was the fiftieth journal in which my soul has yearned to expand itself without success; and upon my failure there, I determined to leave all serial literature to its receipts and recipes for ever. Since then, however, and alas! I have been as constant a contributor—a rejected contributor, that is—to everything as I was before: I found myself, the very next day, composing a tale called the Screw, the Lever, and the Plummet-rule, which I afterwards sent to the Freemason's Intelligencer, sealed with a pair of compasses, and signed—I regret to acknowledge—"Brother Smith."

'This disease of *cacoëthes scribendi*, my son, is as hard to combat as dram-drinking or—which I am afraid will be a familiar image—cigar-smoking: avoid it while you may. I forgot to say that oftentimes my sorrow for these many disappointments poured itself forth in song; but I have not wooed the muse with any greater success than the young person, whoever she may be, who presides over unrhythmical compositions. Here are fifty lines from a little lyric—if you'd like to read them—entitled "Never," sent a month ago to the Weekly Coronal, and, need I say, rejected. The time is gone by for poetry in this country, as it is for nervous prose.

'Now, my dear nephew, what do you think of literature as a profession, a livelihood? Quite right and sensible. Go, tell your father that you will be a bishop instead. I'm sorry to turn you out of the study; but when I have finished this passage for *Punch*, I have got to scribble off a little entertaining something for the *Ecclesiologist*.'

PHOTOGRAPH OF A NEGRO TOWN.

HAVING casually expressed a desire, or rather intention, to go over the town—Malagueah in Western Africa—it appeared to have been communicated to the king, and I very soon had a man in attendance, who announced himself as my deputed guide. He was one of the king's messengers, who, probably, had been selected for the office on account of his presumed proficiency in the English language; an acquirement which greatly enhanced his general merits in his own estimation, as well as in mine; and this, with an expression of great good-humour in his countenance, was a tolerable set-off to rather unprepossessing features, of which a prodigious large mouth was the most conspicuous, with, what is rather uncommon among Africans, very irregular coarse teeth: but here, again, nature or habit had counterbalanced the defect, by making that capacious organ the most indefatigable exponent of its owner's self-sufficiency. His costume comprised simply four articles—a long blue shirt, with the usual amplitude of sleeves; a pair of thick-soled native slippers; a small, black, close-fitting cap; and, of course, a gree-gree suspended round his neck. He manifested some impatience to be doing the honours of his office; and that I might judge of his paces beforehand, or gain some idea of his general energy, he continued taking rapid strides backwards and forwards in front of the piazza; stopping suddenly at intervals, and casting an inquiring look at my movements, whilst I remained writing off the immediate current of my thoughts at the table, which had been removed from the inner chamber for my accommodation. In truth, just then, I had no very vehement desire to go forth. The piazza was unusually free from loungers, and, happily, the two or three it contained were taciturn; an agreeable coolness prevailed under the projecting roof, and with it a soft subdued light, quite different

from the broad hot glare of the mid-day sun outside, in which my expectant cicerone was taking his exercise.

But my impatient attendant at once settled the matter by coming to a full stop, taking a dead aim at me with his 'English,' and letting off an appeal to my sympathies which there was no resisting.

'Come, come, ole man!' exclaimed he, 'you go? See town, eh? Fine town, fine walk—berry fine, eh, yes!' and I at once yielded to the half remonstrance, half command, and put aside my papers.

Passing from the yard through the *lodge*, I was going to call it—but the *zadingy*, the native designation, would be better—we proceeded to the right, between walls on either side, which defined the width of the streets at about ten feet, their height being about seven feet, covered at the top with dry palm-leaves and long grass overlapping, to counteract the influence of the sun's rays upon the consolidated mixture of mud and clay of which they were composed, and which presented a yellowish-brown surface, embellished here and there with some fissures and cracks. These street-walls ramify the whole town, extending to the outer wall which surrounds it. At every thirty feet, or thereabout, we come to a lodge or *zadingy*, like the one I had just left; and this leads into a yard or enclosure containing a certain number of houses, that may be regarded as a small walled parish of the town. One *zadingy* occasionally serves for an entrance to two separate enclosures, by having two doorways in the inner wall. At a few of the open spaces which occasionally occur, where one street runs into another in an oblique direction, I observed a circle in the centre, of large rude stones—not, as with us, for the protection of the pious, but consecrated to extempore prayer. It was very evident that general convenience had dictated the direction of the streets, rather than any regard to regularity, the necessary points of communication with the several separate establishments being the chief object. It seemed pretty evident, during my subsequent intercourse with the people, that a prescriptive right existed among them, maintained by mutual good-will and the simplicity of their habits, to pass and repass, without concern, through one another's premises, whenever occasion called for it. This, however, may be considered a prevalent custom among most African tribes, and, indeed, among most primitive peoples.

Notwithstanding the prevailing sameness in the formation of the yards and the structure of the dwellings, they presented distinctive features, and a general attention to order and cleanliness calculated to arrest and gratify the attention of a stranger. In some instances, the houses were rather larger than the majority, thatched and finished with greater nicety, the raised terraces of the piazzas smoother on the surface and sharper at their angles, and many of them were decorated with ornamental borders and quaint figures, somewhat of the Egyptian character, generally worked in the mud composition when in a plastic state, and then coloured red or white. The interior of the houses was remarkable only for simplicity; even the domiciles of the chiefs, which presented no higher distinction than an assortment of firearms and other weapons ranged against the walls. In some dwellings, likewise, the rudely constructed chests common to all were in greater number and larger bulk. The contents of these chests were, probably, a scanty wardrobe, with a hoard of precious knickknacks—*gree grees* that had lost their virtue, or whose virtue combined afforded greater security than a Bramah-lock; probably, also—most probably—a few pieces of European cloths, some heads of American tobacco, and perhaps a copy of, or, more likely, some extracts from the Koran. In some instances, a few mats of superior quality were spread upon the floor, or upon a dais within a

niche which occasionally appeared in the wall, or a platform projecting from it, forming a quadrangular space of about six feet by four, for sleeping.

The dwellings were always round, resembling stunted towers, with a beam placed horizontally across the top of the wall supporting an upright pole. Rough branches of trees rise from the wall to near the top of this pole; and being placed close together, and covered with layers of dried grass, constituting the thatch, they give the building the form of a tent; but occasionally, and more especially in the houses occupied exclusively by the women and children, several extra beams are placed across, on which coarse mats are spread for the reception of store rice or corn; and in the vicinity of these dwellings, the large wooden mortars for cleaning rice, wooden bowls, calabashes, mats, and baskets, with other simple household articles, are commonly to be seen, together with some fowls picking up their living, and giving the place a look of home.

The rafters are simply rough limbs of trees, and the flooring of earth. Wooden flooring would at once become the refuge and nursery of the vermin which so invariably abound within the tropics wherever Europeans locate themselves; while the ruder habitations of the natives are comparatively, if not wholly, free from them. The raised terraces upon which the dwellings of which I am now speaking stand, and the hard compact texture of the composition, serve still further to ward off this nuisance, although the roofs are subject to the inroads of rats, which frequently find a secure retreat within the thick thatch.

In passing through some of these houses, I found the cool uniform temperature within them particularly striking; and for a moment it even produced an acute sense of chilliness. The air being admitted only through two opposite doors, a constant draught is kept up; and it may be questioned whether, with all our science and ingenuity, we could better succeed in accomplishing the object, or in constructing habitations more suitable to the climate and the exigencies of the people; whilst the luxuriant growth of fruit-trees in their vicinity dispenses here and there an agreeable shade, and gives a peculiar charm to their general aspect. One circumstance, however, struck me as militating in some degree against the promotion of coolness, and this was the close proximity of most of the houses in the yards; but within the tropics, it is shade rather than coolness which the native tribes most covet.

A town so laid out and constructed as the one I have thus attempted to describe, and which may be taken as a specimen of the larger towns generally in these regions, presents, if not actual security from aggression, at least serious obstacles to a successful assault by native enemies. With the points of ingress through the outer walls barricaded, the fire of musketry, with which the people are pretty familiar, opens upon the assailants through small apertures; and small loopholes are also pierced at short intervals in the walls themselves. Suppose an entrance to be effected, however, the invaders find every wall in the town, and every *zadingy*, pierced in a similar manner, and every separate yard a citadel in itself. Malagueah is rather a large town, and the number of such 'citadels' is consequently considerable. Although the *zadingies* have no gates, and the dwelling-houses no doors, these are scarcely needed, since, with forests close at hand, there is a ready supply of rough timber for barricades. I was much struck with the paucity of inhabitants visible, and these consisting chiefly of women and children. Some of the yards appeared wholly deserted, and others with only a few valetudinarians collected in the piazza of one house; the bulk of the male population being absent at their 'farms'—a designation given to every patch of ground appropriated to culture—or following whatever other avocations necessity or

inclination had dictated. Collectively, however, the population was estimated at about 3000.

For these particulars, I am indebted to my own observation; but still I could have done little without my guide. Nor am I less indebted to him as master of the ceremonies betwixt the 'lion' he was leading and its interested beholders, than for his laudable efforts in pacifying the screaming infants, and the more lively apprehensions of the elder class of youngsters, who scampered off in all directions on my approach, and were to be seen here and there peering from some nook and corner to which they had retreated. My indefatigable conductor seemed to have computed the precise number of 'yards' within the town, and the portion of time that required to be allotted to each of them, on the assumption that I was to visit them all; so that by the time I had seated myself in a piazza, and shaken hands with the men, and he had beckoned to and joked with the women, and then discharged a voluble description of my characteristics and habits, his peroration was ended with a spring upon his feet and a transition from *soo-soo* to English in reiterating, on every occasion: 'Come, *ole man!* you come—fine yard, eh?—fine house—fine woman, eh?—berry fine!—yes!' and away he then went with prodigious strides, his loose slippers clattering like castanets, and his long loose sleeves provoked into a mighty perturbation by the action of his arms. He was a character to amuse for a time, till the time came for putting him under some restraint; and that time arrived when we had reached the extremity of the town where the outer walls run parallel with the river. Conscious, perhaps, that, as a 'government officer,' he was fulfilling his instructions by shewing me only *over* the town, it was evidently not his intention to shew me *out* of it; and so I became the leader in turn, and, passing through the public zadingy, we at once entered upon the high-road, which runs parallel with the walls, and, to the right, leads to the town of Mellicourie, at the head of the river, about fourteen miles distant. Unlike the ordinary beaten tracks which come under the name of roads in Africa, this was about forty feet wide, perfectly straight and level, and carpeted with grass as far as the eye could reach. It was flanked on either side by luxuriant forest timber. 'Fine road,' exclaimed my companion; 'berry fine, eh?—*os—os road—os here,*' pointing to the spot where we stood—'*os dere,*' waving his hand towards the distance in the vista—'*os back—ras—os-ras—berry fine, berry—eh?—yes!*' by which I acquired a vague notion, afterwards confirmed, that it was the race-course. I could not resist walking about a mile in the cool shade of this beautiful avenue, contemplating the several varieties of fine timber, and the wild luxuriance of the underwood; the treading upon the soft greenward, and the breathing of a pure-tempered atmosphere, affording a grateful contrast after traversing the uneven streets in the open glare of the sun and the reflected heat from the walls and sandy soil. In returning, we still kept on the outskirts of the town at a right angle with the road, and leading towards another entrance, having the forest still on one side of us; and here my companion certainly brought me completely at fault as he directed my attention to what he termed *berry-bush* in his usual strain of commendation—'*Fine berry-bush—you see—berry fine, eh?—yes!*' Presently, however, I discovered, in a more open situation between the stems of the trees, several small hillocks identical in form with our common graves; and which at once conveyed to me the fact, that this portion of the forest was the '*bury-bush,*' or *burying-ground*. On taking a more extensive survey of this region of death, I could not discover the slightest distinction in these mementoes of mortality, or any sign by which one might be identified from another. One and all alike, they collectively proclaimed to the living that 'underground precedence is a jest,' and the

Greek epitaph, slightly paraphrased, might serve for each of them:

My name—my country—what are they to thee?
What, whether base or proud my pedigree;
Perchance I far surpassed all other men;
Suppose I fell beneath them all—what then?
Suffice it, stranger, that thou see'st a grave,
Thou know'st its use; it holds—perchance a SLAVE!

Perhaps, after all, I might have acquired the needful information, or have fully satisfied my curiosity by sauntering leisurely through the town *without a guide*. I might, with perfect nonchalance, have entered the private enclosures, popped my head into this house or that, till I had established a preference in my own mind, or until some sable damsel, perhaps, had established that preference for me. I might have jumped into the first or best hammock that presented itself, called for light for my cigar, palm-wine, jelly-coco-nuts, or whatever fruits might be courting my wayward fancy from some neighbouring trees—frightened all the children out of their wits—played tricks with the women—tried the temper or temperament of the men—'pitched into' my guide for calling me 'old man'—invaded the sanctuary of the mosques—and, finally, have subscribed my initials or my name upon the walls, in order to assist tradition in commemorating the visit of an 'Englishman' to the place. But I contemplated none of these things, and did none of them. The maxim, 'when at Rome, do as Rome does,' is not limited in its application to the eternal city; the proud boast of an Englishman, that 'his house is his castle,' simply enunciates a principle of constitutional liberty of which he is happily participant; but that boast becomes at once a reproach upon him who, whether Englishman or not, cannot reconcile patriotism with a regard to the rights of others, and who heedlessly, not to say lawlessly, invades the domicile of the unoffending 'savage.'

THE WAR-TRAIL:

A ROMANCE.

CHAPTER LVI.

THE BIVOUAC OF THE GUERRILLA.

I STAYED to hear no more, but drove the spur against the ribs of my horse, till he sprang in full gallop along the road. Eager as were my men to follow, 'twas as much as they could do to keep up.

We no longer thought of scouts or cautious marching. The trappers had mounted, and were galloping with the rest. We thought only of time.

We rode for the hacienda de Vargas, straight up the river. Although it was beyond the rancheria, we could reach it without passing through the latter—which lay some distance back from the stream. We could return to the village afterwards, but first for the hacienda. There I wished to arrive in the shortest time possible. The miles flew behind us, like the dust of the road.

Oh, should we not be in time! I feared to calculate the length of the interval since the boy had heard that rabble rout. Was it more than an hour? Five miles to the rancho, and he on foot. Had he travelled rapidly? Yes, here and there; but he had made a stop: some men had passed him, and he had hidden in the bushes till they were out of sight. He had been more than an hour on the way—nearly two, and one would be enough for the execution of the darkest deed. Oh, we should not arrive in time!

There was no delay now. We were going at top-speed, and in silence, scarcely exchanging a word. Alone might be heard the clattering of hoofs, the chinking of bits, or the ringing of steel scabbards.

Neither the slimy gutter nor the deep rut of *carreta* wheels stayed our advance; our horses leaped over, or went sweltering through them.

In five minutes we came to the *rinconada*, where the road forked—the left branch leading to the village. We saw no one, and kept on by the right, the direct road to the hacienda. Another mile, and we should reach the house; a quarter of that distance, and we should come in sight of it; the trees alone hindered our view of its walls. On—on!

What means that light? Is the sun rising in the west? Is the chapparal on fire? Whence comes the yellow gleam, half intercepted by the trunks of the trees? It is not the moon!

'Ho! the hacienda is in flames!'

'No—it cannot be? A house of stone, with scarcely enough timber to make a blaze! It cannot be that?'

It is not that. We emerge from the forest; the hacienda is before our eyes. Its white walls gleam under a yellow light—the light of fire, but not of a conflagration. The house stands intact. A huge bonfire burns in front of the portal; it was this that caused the glare through the forest.

We draw up, and gaze upon it with surprise. We behold a huge pile—the material supplied from the household stack of dry fagots—a vast blaze drowning the pale moonshine. We can see the hacienda, and all around it, as distinctly as by the light of day!

For what purpose this holocaust of crackling *acacias*?

Around the fire we behold many forms, living and moving. There are men, women, dogs, and saddled horses. Huge joints are roasting over the red coals, and others, roasted, are being greedily eaten. Are they savages who surround that blazing pile? No—we can see their faces with full distinctness, the white skins and black beards of the men, the cotton garments of the women; we can see *sombreros* and *serapés*, cloth cloaks and *calzoneros* of velvet, sashes and sabres; we can distinguish their voices as they shout, sing, and carouse; we note their lascivious movements in the national dance—the *fandango*. No Indians they! 'Tis a bivouac of the guerrilleros—the ruffians for whom we are in search.

O that I had listened to the voice of prudence, and adopted the strategy of a surround! But my blood was boiling, and I feared to lose even a moment of time, lest we might be too late. But one or two of my followers counselled delay, and, as the event proved, they were the wisest. The rest, like myself, were impatient for action.

The word was given; and like hounds, fresh loosed from the leash, we rushed forward with charging cheer.

It was the madness of fools. Well knew our enemy the hoarse Texan 'hurrah!' It had been shouted to terrify them, when there was no need. They would never have stood ground.

The shout warned them, causing them to scatter like a herd of deer. The steep hill proved too heavy for our horses; and before we could reach its summit, the main body of the guerrilla had mounted and scampered off into the darkness. Six of them fell to our shots, and as many more, with their *she*-associates, remained prisoners in our hands; but as usual that subtle coward had contrived to escape. Pursuit was idle; they had taken to the dark woods beyond the hill.

I thought not of pursuit; my mind was bent on a far different purpose.

I rode into the *patio*. The court was lit up by the glare of the fire. It presented a picture of ruin. Rich furniture was scattered about in the verandah and over the pavement, broken or tumbled down. I called her name—the name of Don Ramon. Loudly and earnestly did I raise my voice, but echo gave the only reply.

I dismounted, and rushed into the verandah, still vociferating, and still without receiving a response. I hurried from room to room—from *cuarto* to *sala*—from *sala* to *saguan*—up to the *azotea*—everywhere—even to the *capilla* in the rear. The moonbeams gleamed upon the altar, but no human form was there. The whole house was deserted; the domestics—even the women of the *cocina*—had disappeared. My horse and I seemed the only living things within those walls—for my followers had remained outside with their prisoners.

A sudden hope gleamed across my heart. Perhaps they had taken my counsel, and gone off before the mob appeared? Heaven grant it might be so!

I rushed out to question the captives. They should know, both men and women: they could certainly tell me.

A glance shewed me I was too late to receive information from the men. A large *pecan* tree stood at one corner of the building. The firelight glared upon it; from its branches hung six human forms with drooping heads, and feet far from the earth. They had just ceased to live!

One told me that the *herredero* was among them, and also the cruel *matador*. Pedro had identified both. The others were *pelados* of the town, who had borne part in the affair of the day. Their judges had made quick work, and equally quick had been the ceremony of execution. Lazos had been reeved over the limbs of the *pecan*, and with these all six had been jerked up without shrift or prayer!

It was not revenge for which I panted. I turned to the women; many of these had made off, but there were still a dozen or more in the hands of the men. They looked haggard with drink; some sullen, and some terrified. They had reason to be afraid.

In answer to my questions, they shook their heads, but gave me no information. Some remained doggedly silent; others denied all knowledge of Don Ramon or his daughter. Threats had no effect. They either knew not, or feared to tell what had befallen them. O heaven! could it be the latter?

I was turning away angered and despairing, when my eyes fell upon a figure that seemed to skulk under the shadow of the walls. A shout of joy escaped me as I recognised the boy Cyprio; he was just emerging from his place of concealment.

'Cyprio?' I cried.

'*Si señor's*,' answered he, advancing rapidly to where I stood.

'Tell me, Cyprio! where are they gone—where—where?'

'*Carrai señor's!* these bad men have carried the *dueño* away; I do not know whither.'

'The señora? the señora?'

'Oh! *cavallero!* es una cosa espantosa!' (It is a terrible thing.)

'Quick, tell me all! Quickly, Cyprio!'

'*Señor's*, there came men with black masks, who broke into the house and carried off the master; then they dragged out Doña Isolina into the patio! *Ay de mi!* I cannot tell you what they did before—*pobre señorita!* There was blood running down her neck and all over her breast: she was not dressed, and I could see it. Some went to the *caballeriza*, and led out the white horse—the steed that was brought from the *llanos*. Upon his back they bound Doña Isolina. *Valga me dios!* such a sight!'

'Go on!'

'Then, *señor's*, they led the horse across the river, and out to the plain beyond. All went along, to see the sport, as they said—*ay de mi!* such sport! I did not go, for they beat and threatened to kill me; but I saw all from the hill-top, where I had hidden myself in the bushes. O *Santissima Maria!*'

'Go on!'

'Then, señores, they stuck *cohetes* in the hips of the horse, and set them on fire, and pulled off the bridle, and the steed went off, with fire-rockets after him, and Doña Isolina tied down upon his back—*pobre señorita!* I could see the horse till he was far, far away upon the *loma*, and then I could see him no more. *Dios de mi alma! la niña esta perdida!*' (Alas! the young lady is lost.)

'Some water! Rube! Garey! friends—water! water!'

I made an attempt to reach the fountain in the patio; but, after staggering dizzily a pace or two, my strength failed me, and I fell fainting to the earth.

CHAPTER LVII.

TAKING THE TRAIL.

I had merely swooned. My nerves and frame were still weak from the blood-letting I had received in the combat of yesterday. The shock of the horrid news was too much for my powers of endurance.

I was insensible only for a short while; the cold water revived me.

When consciousness returned, I was by the fountain, my back leaning against its parapet edge; Rube, Garey, and others were around me. From my dripping garments, I perceived that they had drenched me, and one was pouring a fiery spirit down my throat. There were men on horseback, who had ridden into the patio—the iron hoofs causing the court to ring. They were rangers, but not those who had left camp in my company. Some had arrived since, and others were still galloping up. Those girls had reached the ranger camp, and told their tale. The men had not waited for orders, or even for one another, but rushing to their horses, took the road in twos and threes. Every moment, a horseman, or several together, came riding forward in hot haste, carrying their rifles, as if ready for action, and uttering loud cries of indignation.

Wheatley had arrived among the foremost. Poor fellow! his habitual buoyancy had departed; the gay smile was gone from his lips. His eyes were on fire, and his teeth set in the stern expression of heart-consuming vengeance.

Amidst the hoarse shouting of the men, I heard screaming in the shriller voices of women. It came from without.

I rose hastily, and ran towards the spot: I saw several of the wretched captives stripped to the waist, and men in the act of flogging them, with mule-quirts and pieces of raw-hide rope.

I had feared it was worse; I had feared that their captors were inflicting upon them a *retaliation in kind*. But no—angry as were my followers, they had not proceeded to such a fiendish extremity.

It required all the authority of a command to put an end to the distressing spectacle. They desisted at length, and the screeching and affrighted wretches were permitted to take themselves away—all disappearing rapidly beyond the light of the fire.

At this crisis, a shout was raised: 'To the rancheria, to the rancheria!' and instantly a party, with Wheatley and Holingsworth at its head, rode off for the village. Pedro went along with them.

I waited not for their return; I had formed a plan of action for myself, that would admit of no delay in its execution.

At first, stunned by the blow, and the distraction of my swooning senses, I had not been able to think; as soon as the confusion passed, and I could reflect more clearly, the course I ought to pursue was at once apparent. Vengeance I had felt as the first impulse, and a strong desire to follow up the fiend Ijorra—night and day to follow him—though the pursuit should lead me into the heart of the hostile ground.

This was but a momentary impulse: vengeance must be stifled for the time. A path was to be taken that widely diverged from that of the retreating guerrilla—the trail of the white steed.

Mounting Cyprio, and choosing from my band half-a-dozen of the best trackers, was the work of a moment. In another, we were in the saddle; and descending the hill, we plunged rapidly through the stream, crossed the skirting timber, and soon reached the open prairie.

Under Cyprio's guidance, we found the spot desecrated by that cruel display. The ground was trampled by many hoofs; fragments of paper—powder-blackened—broken rocket-sticks, and half-burnt fuses, strewed the sward—the pyrotechnic *reliquiæ* of the fiendish spectacle.

We halted not there. By the aid of our guide and the moonlight, we rode clear of the confusion; and taking up the trail of the horse, struck off upon it, and were soon far out upon the prairie.

For more than a mile we advanced at a gallop. Time was everything. Trusting to the intelligence of the Mexican boy, we scarcely scrutinised the track, but made directly for the point where the horse had been last seen.

Cyprio's information did not deceive us. A *motte* of timber had served him as a mark: the steed had passed close to its edge. Beyond it, he had seen him no more.

Beyond it, we found the tracks, easily recognisable by Rube, Garey, and myself. There was a peculiarity by which we were prevented from mistaking them: three of the prints were clearly cut in the turf—almost perfect circles—the curve of the fourth—of the off fore-foot—was interrupted by a slight indentation, where a piece had been broken from the hoof. It had been done in that terrible leap upon the rocky bed of the barranca.

Taking the trail again, we kept on—now advancing at a slower pace, and with a greater degree of caution. Late rains had moistened the prairie-turf, and we could perceive the tracks without dismounting. At intervals, there were stretches of drier surface, where the hoof had scarcely left its impression. In such places, one leaped from the saddle, and led the way on foot. Rube or Garey usually performed this office; and so rapidly did they move along the trail, that our horses were seldom in a walk. With bodies half bent, and eyes gliding along the ground, they pressed forward like hounds running by the scent, but, unlike these, the trackers made no noise. Not a word was spoken by any one. I had no list for speech; my agony was too intense for utterance.

With Cyprio I had conversed upon the harrowing theme, and that only at starting. From him I had gathered further details. No doubt, the matador had performed his office. O God! without ears!

Cyprio had seen blood; it was streaming adown her neck and over her bosom: her slight garments were stained red with it. He knew not whence it came, or why she was bleeding. He was not present when that blood had been drawn; it was in her chamber, he thought. She was bleeding when the ruffians dragged her forth!

Belike, too, the *herredero* had done his work? Cyprio had seen the blacksmith, but not the *fierra*. He heard they had branded some at the plazza, among others the daughter of the *alcaldé*—*pobre Conchita!* He did not see them brand the Doña Isolina.

The ruffian deed might have been accomplished for all that; there was plenty of time, while the boy lay hid.

How was she placed upon the horse?

Despite my heart's bitterness, as I put these interrogatories, I could not help thinking of the Cossack legend. The famed classic picture came vividly before

my mind. Wide was the distance between the Ukraine and the Rio Bravo. Had the monsters who re-enacted this scene on the banks of the Mexican river—had these ever heard of Mazeppa? Possibly their leader had; but still more probable that the fiendish thought was original.

The fashion at least was. Cyprio had seen and could describe it.

She was laid longitudinally upon the back of the steed, her head resting upon the point of his shoulder. Her face was downward, her cheek touching the withers. Her arms embraced the neck, and her wrists were made fast under the animal's throat. Her body was held in position by means of a belt around her waist, attached to a surcingle on the horse—both tightly buckled. In addition to this, her ankles, bound together by a thong, were fastened to the croup, with her feet projecting beyond the hips!

I groaned as I listened to the details.

The ligature was perfect—cruelly complete. There was no hope that such fastenings would give way. Those thongs of raw-hide would not come undone. Horse and rider could never part from that unwilling embrace—never, till hunger, thirst, death—no, not even death could part them! O horror!

Not without groans could I contemplate the hideous fate of my betrothed—of her whose love had become my life.

I left the tracking to my comrades, and my horse to follow after. I rode with loose rein, and head drooping forward; I scarcely gave thought to design. My heart was well-nigh broken.

CHAPTER LVIII.

THE VOYAGEUR.

We had not gone far when some one closed up beside me, and muttered a word of cheer; I recognised the friendly voice of the big trapper.

'Don't be afeerd, capt'n,' said he, in a tone of encouragement; 'don't be afeerd! Rube an me'll find 'em afore thar's any harm done. I don't b'lieve the white hoss 'll gallip sur, knowin thar's someb'dy on his back. It war them gim-cracks that sot him off. When they burn out, he'll come to a dead halt, an then'—

'And then?' I inquired mechanically.

'We'll get up, an your black'll be able to overhaul him in a jump or two.'

I began to feel hope. It was but a momentary gleam, and died out in the next instant.

'If the moon 'ud only hold out,' continued Garey, with an emphasis denoting doubt.

'Rot the moon!' said a voice interrupting him; 'she's a gwine to guv out. Wagh!'

It was Rube who had uttered the unpleasant prognostication, in a peevish, but confident tone.

All eyes were turned upward. The moon, round and white, was sailing through a cloudless sky, and almost in the zenith. How, then, was she to 'give out?' She was near the full, and could not set before morning. What did Rube mean? The question was put to him.

'Look ee 'ander!' said he in reply. 'D'ees see thet ur black line, down low on the paraiza?'

There appeared a dark streak along the horizon to the eastward. Yes, we saw it.

'Wal,' continued Rube, 'thur's no timber thur—ne'er a stick—nor high groun neyther: thet ur's a cloud; I've seed the likes afore. Wait a bit. Wagh! In jest ten minnits, the durned thing'll kiver up the moon, an make thet putty blue sky look as black as the hide o' an Afrikin nigger—it will.'

'I'm asferd he's right, capt'n,' said Garey, in a depending tone. 'I war doubtful o' it myself: the

sky looked too near. I didn't like it a bit: thar's always a change when things are better'n common.'

I needed not to inquire the consequences, should Rube's prediction prove correct; that was evident to all of us. The moon once obscured by clouds, our progress would be arrested: even a horse could not be tracked in the darkness.

We were not long in suspense. Again the foresight of the old trapper proved unerring. Cumuli rolled up the sky one after another, until their black masses shrouded the moon. At first, they came only in detached clouds, and there was light at intervals; but these were only the advanced columns of a heavier body, that soon appeared, and without a break, spread itself pall-like over the firmament.

The moon's disc became entirely hidden from our view; her scattered beams died out, and the prairie lay dark as if shadowed by an eclipse.

We could follow the trail no farther. The ground itself was not visible, much less the hoof-prints we had been tracing; and halting simultaneously, we drew our horses together, and sat in our saddles to deliberate upon what was best to be done.

The consultation was a short one. They who formed that little party were all men of prairie or backwoods experience, and well versed in the ways of the wilderness. It took them but little time to decide what course should be followed; and they were unanimous in their opinion. Should the sky continue clouded, we must give up the pursuit till morning, or adopt the only alternative—follow the trail by torch-light.

Of course the latter was determined upon. It was yet early in the night; many hours must intervene before we should have the light of day. I could not live through those long hours without action. Even though our progress might be slow, the knowledge that we were advancing would help to stifle the painfulness of reflection.

'A torch! a torch!'

Where was such a thing to be procured? We had with us no material with which to make one; there was no timber near! We were in the middle of a naked prairie. The universal mezquite—the *algar obia glandulosa*—excellent for such a purpose, grew nowhere in the neighbourhood. Who was to find the torch? Even Rube's ingenuity could not make one out of nothing.

'Ecoutez, mon capitaine!' cried Le Blanc, an old voyageur—'écoutez! vy me no ride back, et von lanterne bring from ze ville Mexicaine?'

True, why not? We were yet but a few miles from the rancheria. The Canadian's idea was a good one.

'Je connais,' he continued—'know I, pe gar I ze ver spot où—vere—sont cachées—hid les chandelles magnifiques—von, deux, tree big candles—vax, vax'—

'Wax-candles?'

'Oui—oui, messieurs! tres grand comme un bâton; ze ver chose pour allumer la prairie.'

'You know where they are? You could find them, Le Blanc?'

'Oui, messieurs—je connais: les chandelles sont cachées dans l'église—zey are in ze church hid.'

'Ha! in the church?'

'Oui, messieurs; c'est un grand sacrilège, mon Dieu! ver bad; mais n'importe cela. Eef mon capitaine permis, vill allow pour aller Monsieur Quack'boah, he go chez moi; nous chercherons; ve bring ze chandelles—pe gar ve bring him!'

From the mixed gibberish of the voyageur, I could gather his meaning well enough. He knew of a depository of wax-candles, and the church of the rancheria was the place in which they were kept. I was not in a frame of mind to care much for the sacrilege, and my companions were still less scrupulous. The act was determined upon, and Le Blanc and

Quackenboss, without more delay, took the back-track for the village.

The rest of us dismounted, and picketing our horses to the grass, lay down to await the return of the messengers.

CHAPTER LIX.

TRAILING BY TORCH-LIGHT.

While thus inactive, my mind yielded itself up to the contemplation of painful probabilities. Horrid spectacles passed before my imagination. I saw the white horse galloping over the plain, pursued by wolves, and shadowed by black vultures. To escape these hungry pursuers, I saw him dash into the thick chaparral, there to encounter the red panther or the fierce prowling bear—there to encounter the sharp thorns of the acacias, the barbed spines of the cactus, and the recurring claw-like armature of the wild aloes. I could see the red blood streaming adown his white flanks—not his blood, but that of the helpless victim stretched prostrate along his back. I could see the lacerated limbs—the ankles chafed and swollen—the garments torn to shreds—the drooping head—the long loose hair tossed and trailing to the earth—the white wan lips—the woo-be-speaking eyes—Oh! I could bear my reflections no longer. I sprang to my feet, and paced the prairie with the aimless unsteady step of a madman.

Again the kind-hearted trapper approached, and renewed his efforts to console me.

'We could follow the trail,' he said, 'by torch or candle light, almost as fast as we could travel; we should be many miles along it before morning; maybe before then we should get sight of the steed. It would not be hard to surround and capture him; now that he was half-tamed, he might not run from us; if he did, he could be overtaken. Once in view, we would not lose sight of him again. The saynyora would be safe enough; there was nothing to hurt her: the wolves would not know the "fix" she was in, neither the "bars" nor "painters." We should be sure to come up with her before the next night, and would find her first rate; a little tired and hungry, no doubt, but nothing to hurt. We should relieve her, and rest would set all right again.'

Notwithstanding the rude phrase in which these consolatory remarks were made, I appreciated the kind intent.

Garey's speech had the effect of rendering me more hopeful; and in calmer mood, I awaited the return of Quackenboss and the Canadian.

These did not linger. Two hours had been allowed them to perform their errand; but long before the expiration of that period, we heard the double trampling of their horses as they came galloping across the plain.

In a few minutes they rode up, and we could see in the hands of Le Blanc three whitish objects, that in length and thickness resembled stout walking-canes. We recognised *les chandelles magnifiques*.

They were the property of the church, designed, no doubt, to have illumined the altar upon the occasion of some grand *día de fiesta*.

'Voilà! mon capitaine!' cried the Canadian, as he rode forward—'voilà les chandelles! Ah, mon Dieu! c'est von big sacrilège, et je suis bon Chrétien—buen Catolico, as do call 'im ze dam Mexicaine; bien—ze bon Dieu we forgive—God ve pardon vill pour—for ze grand necessitie; sure certains he vill me pardon—Lige et moi—ze brave Monsieur Quack'bosh.'

The messengers had brought news from the village. Some rough proceedings had taken place since our departure. Men had been punished; fresh victims had been found under the guidance of Pedro and others

of the abused. The trees in the church enclosure that night bore horrid fruit.

The alcaidé was not dead; and Don Ramon, it was supposed, still survived, but had been carried off a prisoner by the guerrilla! The rangers were yet at the rancheria; many had been desirous of returning with Le Blanc and Quackenboss, but I had sent orders to the lieutenants to take all back to camp as soon as their affair was over. The fewer of the troop that should be absent, the less likelihood of our being missed, and those I had with me I deemed enough for my purpose. Whether successful or not, we should soon return to camp. It would then be time to devise some scheme for capturing the leader and prime actor in this terrible tragedy.

Hardly waiting to hear the story, we lighted the great candles, and moved once more along the trail.

Fortunately, the breeze was but slight, and only served to make the huge waxen torches flare more freely. By their brilliant blaze, we were enabled to take up the tracks, quite as rapidly as by the moonlight. At this point, the horse had been still going at full gallop; and his course, as it ran in a direct line, rendered it more easy to be followed.

Dark as the night was, we soon perceived we were heading for a point well known to all of us—the prairie mound; and, under a faint belief that the steed might have there come to a stop, we pressed forward with a sort of hopeful anticipation.

After an hour's tracking, the white cliffs loomed within the circle of our view, the shining selenite glancing back the light of our tapers, like a wall set with diamonds.

We approached with caution, still keeping on the trail, but also keenly scrutinising the ground in advance of us—in hopes of perceiving the object of our search. Neither by the cliff, nor in the gloom around, was living form to be traced.

Sure enough the steed had halted there, or, at all events, ceased from his wild gallop. He had approached the mound in a walk, as the tracks testified; but how, and in what direction had he gone thence? His hoof-prints no longer appeared. He had passed over the shingle, that covered the plain to a distance of many yards from the base of the cliff, and no track could be found beyond.

Several times we went around the mesa, carrying our candles everywhere. We saw skeletons of men and horses with skulls detached, fragments of dresses, and pieces of broken armour—souvenirs of our late skirmish—we looked into our little fortress, and gazed upon the rock that had sheltered us; we glanced up the gorge where we had climbed, and beheld the rope by which we had descended still hanging in its place: all these we saw, but no further traces of the steed!

Round and round we went, back and forward, over the stony shingle, and along its outer edge, but still without coming upon the tracks. Whither could the horse have gone?

Perhaps, with a better light, we might have found the trail; but for a long hour we searched, without striking upon any sign of it. Perhaps we might still have found it, even with our waxen torches, but for an incident that not only interrupted our search, but filled us with fresh apprehension, and almost stifled our hopes of success.

The interruption did not come unexpected. The clouds had for some time given ample warning. The big solitary drops that at intervals fell with plashing noise upon the rocks, were but the *avant-couriers* of one of the great rain-storms of the prairie, when water descends as if from a shower-bath. We knew from the signs that such a storm was nigh; and while casting around to recover the trail, it commenced in all its fury.

Almost in an instant our lights were extinguished, and our bootless search brought to a termination.

We drew up under the rocks, and stood side by side in sullen silence. Even the elements seemed against me. In my heart's bitterness, I cursed them.

THE MONTH:

SCIENCE AND ARTS.

LOOKING on the surface of things, it might be thought there was nothing but politics to talk about—how the elections went, and so forth. However, science and art have not ceased to advance as an undercurrent: mathematicians have made further discoveries in their favourite science, and sent the results to the Royal Society in papers very learned, and very abstruse. Chemists have not been idle, as will ere long be demonstrated. Among them, Dr Marcey is realising experiments which Gulliver the voracious once saw at Laputa; he, the doctor, being engaged in an elaborate investigation of the nature and properties of fecal matters, and not without important consequences. Some part of his researches has appeared in the *Philosophical Transactions*, and now he has carried the inquiry further, and exhibits beautifully formed crystals of a new substance, to which he gives the name *accretine*.—Dr Herapath is studying the optical character of certain alkaloids, quinin and cinchonidin, as chemists call them, and has obtained some singularly interesting results, which come in with the manifold phenomena of light.—Mr Faraday's views on the *Conservation of Force*, as mentioned in our last, have already met a rejoinder from a partisan of the old doctrine; hence, we may hope ere long to see these views presented in a popular form.—And when we add that Major-general Sabine is occupied with a voluminous work on terrestrial magnetism, which is to embody everything at present known on that interesting subject, it will be seen that science has not abated her thoughtful labours while the nation has been speaking out its mind on political affairs.—The science of magnetism has suffered a loss by the death of Dr Scoresby. He was devoted to it, and we hear that his decease was hastened by over-exertion in his late voyage to Australia, which resulted in confirming his theory for correcting the compass on board iron ships in both hemispheres.

We mentioned not long ago Professor William Thomson's theory for signaling rapidly by telegraph, by means of what he calls 'condensed pulses,' to be reduced to practice some day on the Atlantic telegraph. So far, everything promises well for success: the United States Congress have approved the measures for laying down the cable; and the government will lend two of their most powerful steamers to assist in the work. Our Admiralty will also lend two; and the project is, that the four shall meet about the middle of the Atlantic, when, two of them being laden with the halves of the cable, the wires will be united, and the vessels, steering in opposite directions, will pay out cable till the shore on either side is reached. The other two steamers are to keep near at hand to render assistance in case of need.—Meanwhile, Mr C. V. Walker has discovered an ingenious method of signaling on a railway—in other words, of enabling the guards of a disabled train to ask for help from the nearest stations in either direction. It has been

for some time in use on the South-eastern Railway—one of the most efficient telegraph lines in the kingdom—and answers its purpose so well, that we see no reason why it should not be generally adopted. To describe it in few words, we must premise that by a peculiar arrangement of the battery apparatus, Mr Walker keeps the 'line-wire' in what he calls a null condition. Suppose, then, that a train breaks down. The guard, who carries with him a slender iron rod, hooks one end of it to the null-wire, and with the other touches one of the rails; whereupon, seeing that magnetic currents are constantly passing along the rails, a shock or impulse is at once transmitted from the rail, through the rod, and along the line-wire to the stations. Each touch becomes a signal; and by a simple code combining six touches, the nature of the assistance required may be indicated, for, as is easy to imagine, such a method involves no spelling out of words on a dial-plate. Here, then, is a great desideratum accomplished; simple, and yet effectual. Its importance is recognised by an account of it having been read at a meeting of the Royal Society, as may be seen in the *Proceedings* of that learned body.

Apropos of the Society: we promised to report progress concerning them. They are now removed to their new and commodious quarters in Burlington House, where, for the benefit of science, the Linnean and Chemical Societies are to lodge under the same roof. The apartments which the Society have occupied in Somerset House since 1780, will now, we believe, be converted into government offices; and so the memorable associations that haunt therein, will be disturbed by the intrusion of bustling clerks, with tape, desks, and easy-chairs.

Mr Palliser's project for an exploration of parts of the Hudson's Bay Company's territory lying beyond the Red River Settlement and the Saskatchewan, is approved by government, and some of the party are already on the way to the scene of their labours. Among them there will be a botanist, mineralogist, and geologist; so that we shall get trustworthy information concerning the natural resources of the country, as well as its topography and capabilities. Some three or four years ago, we mentioned a report published by the Geographical Society on the region in question, in which its general features were described—a fertile land, rivers and lakes teeming with fish, and picturesque withal. When the present expedition shall have accomplished its task, we shall doubtless hear of a brisk immigration from Canada West and the adjacent States. Among the instruments with which the explorers will be supplied, are those necessary for taking magnetic observations—the phenomena being, as is well known, of especial interest in the higher latitudes. Seeing that the instruments were verified at the Kew Observatory, and that a committee of the Royal Society gave counsel as to the scientific objects of the expedition, the best results may be hoped for.

Yet another is to be added to the list of travellers who have perished while exploring the interior of Africa, if the news be true that Dr Vogel was assassinated after leaving Kuksa with the hope and intention of reaching the Nile. As will be remembered, he went out three years ago accompanied by twoappers, to join Dr Barth. The latter has returned in safety; and we trust that the rumour of his follower's death will turn out to be unfounded.—The Leichardt exploring-party are still missing in Australia, and late accounts from the colonies mention a searching expedition as likely to be set on foot.

Another example of what can be done with coloured bricks and good workmanship towards improving street-architecture, may now be seen in Fetter Lane—a site by no means favourable. It is a four-story building, intended for a printing-office; and with its harmonious colours, arched windows, ornamental cornice and

chimneys, proves to demonstration that a place of business need not be ugly. The streets of London are so eminently capable of improvement in this particular, that we gladly notice a favourable fact.—We hear from time to time of Model Lodging-houses opened in provincial towns—as recently at Ipswich—implying an advance in social arrangements, yet, from some cause, these houses in London do not flourish. Either the rents are too high, or there is too much of going up and down stairs, or the regulations are such as not to leave sufficient freedom to the ordinary class of tenants. The latter is probably the most powerful cause. We heard recently of an eminent manufacturing firm in Suffolk who built comfortable rooms as lodgings for the single men in their employment. No objection was made to the amount of rent, or to the accommodation; there was everything that an artisan could require for comfort and self-respect, and yet the rooms were left untenanted. ‘The men,’ said one of the firm, ‘prefer a pigsty with liberty, to decent quarters with regulations. And liberty has a wide meaning—from leave to be dirty, to license to tittle.’

The Institute of British Architects have submitted the name of Mr Owen Jones to the Queen, as one worthy the award of the Royal medal; and they purpose giving their ‘Soane Medallion’ and ‘Medal of Merit’ to the two best designs for a metropolitan hotel. They announce, moreover, as subjects for future prizes: ‘The application of wrought iron to structural purposes’—‘The influence of local materials on English architecture;’ and they promise a tangible honour ‘for the best design in not less than five drawings, for—a marine sanitarium, or building for the temporary residence of a limited number of convalescents belonging to the middle and upper classes of society.’ The Institute do not confine themselves to the merely useful, as Mr Papworth’s paper lately read before them, ‘On Beauty in Architecture and its Alliance with the Past,’ abundantly testifies.

Certain agricultural chemists in France have discovered that pounded glass is profitable in cultivation of the land; and M. Paul Thénard is making experiments on a great scale with the pulverised slag of blast-furnaces. This slag he believes to be equivalent to feldspathic rock, and eminently attackable by the agents present in the soil and atmosphere; for the constituents are silicates, anhydrous potash, and iron. He has set up the necessary machinery for pulverising the stubborn lumps, and promises to publish his results as soon as they are justified by practice. Should they confirm the results obtained on a smaller scale, what an opening there will be for a new branch of industry, in the preparation of a fertiliser from heaps of refuse, at present regarded as a nuisance; and what profit Staffordshire will make out of its hideous mountains of waste!

Schoenbein, pursuing his experiments on ozone, finds certain facts, apparently unimportant in themselves, but not so in their relations to chemical science. He shows that an alcoholic solution of two kinds of mushrooms—*Boletus luridus* and *Agaricus sanguineus*—colourless in itself, turns blue under the influence of ozone; and that the expressed juice of these same mushrooms contains an organic matter capable of transforming oxygen into ozone.—A series of test-experiments for ozone, made last year at Birmingham, confirm the conclusions arrived at in other towns in England and on the continent. ‘When the wind blew from the country,’ says the observer, ‘a fair, or probably a full quantity of ozone was indicated; but when the current of air had passed over the town, or came from the colliery district, there was no indication of it, excepting in high winds, when traces of it were noticed.’—Professor Rogers of Boston, United States, from a similar course of experiments, inclines to believe that the presence of ozone is dependent on certain winds. During easterly

or southerly winds, for example, he found ozone to be nearly or quite undiscoverable, but abundant on a change to the west or north-west. As there is much greater contrast in respect of dryness and moisture among the winds of the United States than of this country, it is not improbable that, from a long course of observations, something like a law may be arrived at for this remarkable atmospheric constituent.

The nursery established in Algeria by the French government, at the instance of the Société d’Acclimation, prospers with some of its productions. Three plants of caoutchouc (*Ficus elastica*) brought from Coromandel twelve years ago, are now ‘nearly ten mètres high, and eighty centimètres in circumference at one mètre from the ground, and the branches extending horizontally cover a great space.’ These trees were tapped in 1855, in order that specimens of Algerine caoutchouc might appear in the Paris Exhibition. The *Croton sebiferum*, from China, is also successful, having begun to yield fruit, and the sugar-sorgho. This latter plant, says M. Hardy, the director, ‘secretes on the surface of its stalks, at full maturity, a white resinous powder, from which candles could be made. A hectare of sorgho gives more than a hundred kilogrammes of this substance.’ As yet, the attempts made to acclimatise wax and tallow-bearing plants, the gutta-percha and Peruvian bark, have failed.
